Of the sedges also some are, in India, employed for making ropes, as the Bhabbur or *Eriophorum cannabinum*, for making rope bridges for crossing some of the hill torrents. The papyrus was used by the Egyptians for making their paper, by cutting the material into thin slices and making them adhere together under pressure. But others of the genus, as the *Cyperus legetum*, are used in India for mat-making, and as these plants as well as rushes grow together in large quantities, it would be quite possible in many places to turn them to profitable account.

Among cultivated plants there is probably nothing so well calculated to yield a large supply of material fit for making paper of almost every quality as the plantain (*Musa paradisiaca*) so extensively cultivated in all tropical countries on account of its fruit, of which the fibre-yielding stems are applied to no useful purpose.

The flax plant abounds in fibre, but this is too valuable to be converted into paper. India, however, grows immense quantities of the plant

on account of its seed (linseed), which is both consumed in the country and exported in enormous quantities, but nowhere is the fibre turned to any account. This is, no doubt, owing to the climate not favouring the formation of soft and flexible fibre; but the short fibre which is formed, and might be easily separated, would be valuable for paper-making, and might add to the agriculturists' profits without much additional outlay.

So some malvaceous plants are cultivated on account of their fruits being used as articles of diet, as Okhro (*Hibiscus esculentus*) of the West Indies and of the United States. The Ram-turai of India is closely allied to it, and is cultivated for the same purposes. Both plants abound in fine flexible fibre, which is not, but might be easily, separated, and afford a considerable supply, especially if the cultivation was extended in the neighbourhood of towns. Paper is made from a species of hibiscus in Japan, and *Hibiscus sabdariffa* is cultivated in India on account of its jelly-yielding calyces. Numerous other species of hibiscus, of *Sida*, and of other genera of this family, abound in warm climates; several are cultivated in different countries, as *Hibiscus cannabinus* in India, and *Sida titiaefolia* in China; more might be so. They grow quickly, and to a large size, and abound in fibrous material of a fine soft flexible quality, on which account they might be cultivated with profit, and the tow be useful to the paper-maker.

Several species of *Grewia* yield edible fruit, on which account they are cultivated. Others abound in the jungles, and most would yield a valuable fibre, as some of them already do, for commercial purposes. Some paper is made from gunny bags. Some of the leguminosæ also abound in valuable fibre. *Crotalaria juncea* yields the common sunn of India. *Sesbania cannabina* yields the dhunchi of Bengal; while *Bauhinia racemosa* is used for making rope-bridges in the Himalayas. The fibre of *Parinsonia aculeata* was sent to the Exhibition in 1851 expressly as being fitted for paper-making but though colourless it wants strength.

Several plants produce large quantities of a silky cotton-like substance, not applied to any use, such as the silk-cotton tree, the mudar of India, and several species of *saccharum*, which might be collected where labour is cheap, and would no doubt be well fitted for conversion into pulp for paper.

Among the nettle, the mulberry, and bread-fruit tribes of plants there are many which seem well calculated to yield material for paper-making. The Chinese employ the inner bark of *morus*, now *Broussonetia papyrifera*. This, no doubt, produces some of the Chinese paper, which is remarkable for tough-

ness. The refuse cuttings of the bush cultivation of the mulberry in Bengal might be turned to profitable account. The barks of many stinging (*Urtica*), and of stingless (*Boehmeria*), nettles abound in fibres remarkable for strength; the tow of these might be converted into paper stuff if not required for mixing with wool.

The weeds of tropical countries which grow in such luxuriance, and among which are species of *Sida*, of *Grewia*, of *Corchorus*, of *Triumfetta*, and of many other genera, might all yield an abundance of fibrous material. Some simple machinery for separating the fibre would greatly facilitate operations.

Mulberry bark paper, from the bark of the *Broussonetia papyrifera* is used in China and Japan for the preparation of a paper. The inner bark is employed, the young branches being boiled in alkaline water to free them of epidermis, which is scraped off. It is then boiled to the consistence of a paste, which is moulded or fabricated as the *Daphne*. In Japan paper made of the paper mulberry bark, is used to form the walls of rooms, and the fans in universal use. It is used as wrapping paper and forms the string to tie it. In square pieces, it is used as pocket handkerchiefs, and pressed together and lacquered, is worn as hats. This paper is of every consistency, but always tough. The youngest branches form the whitest paper. The process consists in boiling down the bark and straining it through a sieve when it is mixed with rice and the water is gradually drawn off. The pale-like substance is then spread carefully into sheets pressed between boards, and laid down in the sun to harden and dry. It is impossible to tear this paper against the grain. From this plant the Japanese make abundance of paper as well as for writing, and printing, as for tapestry, handkerchiefs, packing cloths, for goods, &c. It is of different qualities, and some of it is as soft and flexible as cotton cloth. Indeed, that used for handkerchiefs might be mistaken for cloth, so far as toughness and flexibility are concerned. In December, after the tree has shed its leaves, they cut off the branches about three feet in length and tie them up in bundles. They are then boiled in a ley of ashes in a covered kettle, till the bark is so shrunk that half an inch of the wood may be seen projecting at either end of the branch. When they have become cool, the bark is stripped off and soaked in water three or four hours until it become soft, when the fine black skin is scraped off with a knife. The coarse bark is then separated from the fine. That of the new branches makes the finest paper. The bark is then boiled again in fresh ley, continually stirred with a stick, and fresh water from time to time is added. It is then

put in a sieve and taken to a brook, and here the bark is incessantly stirred until it becomes a fine pulp. It is then thrown into water and separates in the form of meal. This is put into a small vessel with a decoction of rice and a species of Hibiscus, and stirred until it has attained a tolerable consistence. It is then poured into a large vessel, from whence it is taken out and put in the form of sheets, on mats or layers of grass straw, these sheets are laid one upon another with straw between, and pressed to force the water out. After this, they are spread upon boards in the sun, dried, cut, and gathered into bundles for sale. This paper will better endure folding, and last longer than that made in Europe. The paper mulberry tree is called in Chinese Ch'u, also Kan-sang, also Kan-sing, and is common both in China and Japan. Its globular red fruit is much eaten by children. The wood is used for making vessels of various kinds. The seeds are small, round, of a bright red colour, and much broken up, as met with in the shops. They are mucilaginous to the taste, and are believed to be tonic and invigorating. The leaves and branches are lenitive and diuretic, and may be used to make a ptisan in gonorrhoea.

Daphne paper.—The Burmese make a coarse paper, from the bark of a large creeper found in the forests. The paper is thick, like paste-board, and the surface is blackened, and written upon with a steatite pencil. Dr. Mason had never seen the plant in flower, but probably, he deemed it, a species of *Daphne*.

Chinese paper.—The Chinese affirm that eighteen centuries ago they had discovered the secret and means of manufacturing paper. Before that invention they used to inscribe written characters on strips of bamboo or sheets of metal, using a style, or pen of iron for the purpose of making the characters, and this they assert, had been the practice of their nation from the most remote ages. Before the art of paper-making had arrived at perfection, the Chinese adopted the practice of writing upon white silk, or cotton, with a bamboo pen; this was found a more convenient method than writing either on strips of bamboo or sheets. In China paper is manufactured from various materials, each province or district has its own peculiar manufacture. In Fo-kein province, it is made from young soft bamboo; in the province of Che keang, it is made from paddy straw; in the province of Kiang-Nan, it is made from the refuse silk, and this paper is very fine and delicate, being highly valued for writing complimentary inscriptions upon. To size the paper and render it fit for ink, they make a glue, somewhat similar to isinglass, from fish bones, these they chop up very small, and soak the

mass, in water which is continually renewed. When all oily impurity is extracted, they add a due proportion of alum, which has been dissolved. Over the vessel in which this mixture is, a rod is laid; a cleft-stick is used for holding the sheet of paper during the process of dipping, as soon as the paper has been sufficiently saturated it is withdrawn, by gently rolling it round the stick which has been laid over the vessel; the sheet of paper is afterwards hung to dry either in the open air or near a furnace. Paper with written or printed characters is reverently preserved in all eastern countries. In China, fragments of waste paper are carefully picked up from the streets lest any of the words of sainted men should be dealt with profanely, for writing seems to have been known from the earliest times, and literature has always held a high place. The paper, such as that on which the Hon'ble Mr. Morrison's book was printed, was manufactured from the common yellow bamboo paper of the Chinese by sizing it in water saturated with alum, to which glue is added; the sheets are dried and smoothed by rubbing them on a warm wall. The glazing upon Chinese writing paper is made by waxing the sheet, and afterwards rubbing it with a smooth stone; two, three, and four sheets are made into one thick sheet for ledgers, or other account books, by the same process, after wetting the inner surfaces with glue water, and drying the sheet in the sun. There is also a thin paper called Nanking paper, which is manufactured from cotton wool, that is tougher and more flexible than the bamboo paper. Coloured paper is exported in considerable quantities; the exportation of all kinds is principally to India and the Archipelago. In China itself the consumption of Chinese writing paper is great, on account of its not being injured by the climate; foreign paper sized with glue being liable to spoil.

Bamboo paper.—Mr. Fortune tells us that the whole of the process of making paper from the bamboo did not come under his notice while travelling in the country, but it is carried out somewhat in the following manner:—After being soaked for some time in water the bamboos are split up and saturated with lime and water, until they become quite soft. They are then beaten up into a pulp in mortars, or where water-power is at hand, as in the hilly districts, the beating or stamping process is done by means of stampers, which rise and fall as the cogs which are placed on the axis of the water wheel revolve. When the mass has been reduced to a fine pulpy substance it is then taken to a furnace and well boiled until it has become perfectly fine, and of the proper consistency. It is then formed into sheets of paper. Bamboo-paper is made of various

degrees of fineness, according to the purposes for which it is intended. It is not only used for writing upon and for packing with, but a large quantity of a coarse description is made for the sole purpose of mixing with the mortar used by bricklayers. In the Hinnalaya where, also, paper is made from bamboos, to some extent large water tanks containing a solution of lime are made in the fields, and stems of bamboos are steeped in them for a long time.

Birch bark paper.—Tus or Tuz, is a Birch bark upon which, in addition to leather, we learn that the ancient Persians wrote. The same seems to have been anciently used in north India also. In Huen Tshang's time the early buddhist scriptures of Kasyapa's council were written on the leaves of the Tala palm. In the eleventh century, according to Alburini, paper was used; in the south of India the leaves of the Tar were used, as now but in the provinces of Central and Northern India, they used the inner bark of a tree called tuz. And it was the branch of a tree of the same kind called Bhøj, a species of morus with which they covered their vessels.

Plantain fibre paper.—Dr. Alexander Hunter of the Madras Medical Department, has mentioned that there is no scarcity in India of raw materials suited for the finest descriptions of paper and cordage. The fibres and tow made from the common plantain or *Musa paradisiaca*, Manilla plantain or *Musa textilis*, *Agave Americana* or common *Aloe* and *Yucca gloriosa* or Adam's needle, are nearly all pure white, silky and strong. When prepared by the simple process of beating or crushing the green plants, the day after they were cut, washing and scraping away the sap on the same day and hanging up the fibres to dry in the shade. The great matter is to avoid letting the sap remain along with the fibre even for one night, for it immediately begins to discolour the fibre and takes away the strength, the colour, and the soft pliancy of the fibre; this defect is perhaps more seen with the plantain and with grasses and straw than with any other classes of plant; they become very dirty and brittle, with only one or two nights of soaking, but the plantain yields very strong paper of a beautiful clean colour almost white if prepared in the way explained, but the stem of the plantain contains such a small per-centage of fibre that it will hardly pay as a material for paper, the great use of it now is as a substitute for silk in carpet weaving, and Messrs. Whittock and Co., of Edinburgh introduced this substance extensively for carpet and rug manufactures, as the substance takes dyes of almost any colour and preserves its silky glossy look.

Aloe fibre was found to be better suited for paper-making than the plantain, as it has

more substance and yields a bulky opaque creamy pulp.

Malvaceous and cotton plants. Some of the best materials for paper-making in India, are the barks of trees allied to the Hibiscus, Mulberry, Malvaceous and Cotton plants. The *Bauhinias*, *Grewia* and *Guazuma* or Bastard Cedar. The principles of cleaning them are the same as for other fibres, viz., to get away the sap and juices of the plants as soon as possible, and if this is done within 20 or 30 hours after the plant is cut, a nearly pure white strong fibre can be obtained. Several trees contain tannin which almost immediately begins to discolour the fibre of the bark, as soon as the branch is cut off from the parent tree. To remove this a caustic ley made of fresh burnt lime and wood ashes should be prepared, and the bark after having been stripped off, well-beaten with sticks and washed with water, may be soaked for one night in this caustic ley, next morning, the bark should be well-beaten with sticks on a flat board, washed with clean water and hung up in the shade to dry. In this way very strong and nearly white materials for paper can be prepared at a cheap rate. The beating or crushing allows the water to remove the sap and the tannin is dissolved by the alkali before the fibres have time to get discoloured. Messrs. Cowan and Co., Paper Manufacturers, Silver Mills near Pennycuick, reported most favourably upon the materials for paper which were sent home from India, and samples of the papers and raw materials collected in Madras were added to their valuable Museum.

Nepaul paper is manufactured almost exclusively in Nepaul from the bamboo. After being cut, it is beaten in wooden mortars until reduced to a pulpy mass, then thrown into a vat of water, the impurities separated, and when of a proper consistence, it is spread on linen to be dried; the surface is rendered smooth by friction, and with a pebble on boards. Its structure is very tough, and cannot be torn rectilinearly; and it is most serviceable for filtration, as the fibres do not separate readily when saturated with moisture, and will resist in a moist condition considerable rough handling.

The Nepaul paper plant is the *Daphne cannabina* one of the *Thymeleæ*. At the Great Exhibition of 1851, many visitors were much interested about a huge sheet of Nepaul paper exhibited by Colonel Sykes. This was curious, not only on account of its size, but also on account of the plant from which it was made. It was from the inner bark of *D. Bholua* (*D. cannabina* of Loureiro, and which is supposed to be identical with the *D. odora* of Thunberg which is extremely abundant in the

Himalayas,) that this Nepaul paper is made, as from other species in other countries. Another plant of the same, or of an allied genus, as it is called both *Daphne* and *Gnidia eriocephala*, is very common on the ghauts of the west of India, and in the hill parts of the southern Mahratta country and of the Dekhan. It is probable that it might be turned to the same use as the Nepaul plant. Mr. Hodgson ('Journ. As. Soc.,' i, p. 8, 1832) and Dr. Campbell, describe the process of making paper from the *Daphne cannabina* as consisting, first, in boiling slips of the inner bark of the paper plant in a ley of wood-ashes for about half an hour, by which time the slips will be quite soft. These are then beaten in a stone mortar with a wooden mallet till they are reduced to a homogeneous pulp. This is then diffused through water, and taken up in sieves and paper frames, as in the ordinary process for making paper by hand. When dry, the sheet of paper is folded up; sometimes it is smoothed and polished by being rubbed on wood with the convex side of a chalk shell: but Mr. Hodgson does not explain how the very large sheets of several yards square are made. Though called Nepaulese, the paper is not manufactured in Nepaul, but in Cis-Himalayan Bhoot, in the midst of its immense forests, where there is an abundant supply of the plant, of wood for ashes and for firewood, as well as a constant supply of clean water. This paper is remarkable for its toughness, as well as its smoothness. Some of it, in the form of bricks of half-stuff, was sent to England previous to the year 1829. As the quantity sent was not sufficient for a complete experiment, a small portion of it was made into paper by hand. An engraver, to whom it was given for trial, stated that "it affords finer impressions than any English-made paper, and nearly as good as the fine Chinese paper which is employed for what are called India paper proper ('Gleanings in Science,' i, p. 210.) Dr. Campbell describes the paper, as made by the hand, "as strong, and durable as leather crust, and quite smooth enough to write on; and for office records, incomparably better than any Indian paper. It is occasionally washed with preparations of arsenic, in order to prevent the destruction caused by insects. Many of the books in Nepaul, written on this paper, are said to be of considerable age, and that the art of making paper seems to have been introduced about 500 years ago from China, and not from India." He states that this paper may easily be procured at Patna, Purneah and other places in the plains of both Southern and North-Western India.

Other paper plants.—A paper from Madura made from was sent to one of the Madras Exhibitions. Paper is made from the reticulated fibre of *Abelmoschus ficulneus*. The

source of the rice paper of commerce continued long a matter of doubt, but it is now equally certain that it is produced from the *Aralia papyrifera*. Egyptian paper in the seventh century, A.D., was freely exported to Constantinople. The flax paper of Khorasan was introduced into Arabia, under the Omeiad or the Abasside kaliphs. Dr. Riddell strongly recommends the *Hibiscus esculentus*, for this purpose. Several bales of the straw of certain Indian grasses having been forwarded to the Society of Arts with the view of ascertaining whether any of them contain the necessary ingredients for paper manufacturing, superior to the common rush of England, the report of competent judges was unfavourable. They considered that none of them are well adapted for the making of paper, though they did not doubt that paper can be made from all of them. The common rice straw (*Oriza sativa*) would make the best. They add that all the samples are very inferior in paper-making quality to many substances which can be obtained readily in England, but which even are not considered as worth using; in fact it would appear that materials well fitted for making paper, can be brought and delivered at the paper mills for less money than the mere freight from India of any of the specimens sent by the Society. Mr. Foster remarks on this subject that there is much misapprehension as to the want of paper-making materials in Great Britain. For first class papers, and for inferior papers, there is no want of materials at all, but for medium papers, for printing purposes, there is some scarcity of materials, as evinced by the somewhat higher proportionate price given, as compared with the price of materials for other classes. New materials involve new machinery for reducing them to pulp, and the older paper-makers have not yet established machinery suited for these new materials in addition to that at present in use. Some enterprising men are laying themselves out to make pulp or half stuff for sale to the paper-makers, and it will be by those men that any new materials will be worked. The regular paper-makers would scarcely look at them."

Wooden Paper.—M. Bardoux, a manufacturer of Poitiers, manufactured paper from oak, walnut, pine, and chestnut, without the addition of rags.

In Africa besides the esparto grass and the bark of the *Adansonia*, there is a fibre-producing plant called dissgrass, which, though difficult to work and not so valuable as the better known esparto, can yet be obtained in such quantities and at such a price as will render it a useful luxury. The dwarf palm can be obtained in almost any quantity in Algeria, but the cost of collection is rather more than that of esparto,

, and its manufacture into paper is more difficult and expensive, the texture of the fibre varying in different parts of the leaf, one portion of which contains some yellowish wax or resin, extremely difficult to kill, and almost impossible to detect till it is discovered on the hot rollers and the paper is spoiled. The rivers of South Africa are in many places choked with a plant known as the palmete, a kind of large rush, 8 or 10 feet in height, of which large quantities can be obtained, and which in all probability will be found of use in the fabrication of ropes and paper.

Paper was made at Agra Central Jail, by Dr. W. Walker, from old ropes and gunny bags, bleached by means of carbonate of soda and lime. Such paper can be produced at 5 Rs. or 10s. per ream. In Western India paper is made at Ahmedabad, Surat, Dharwar, Kolapore, and Aurungabad; the workmen are mahomedans: the paper made at Aurungabad bears the palm as to fineness and gloss, hence the demand for it to engross sunnuds, deeds and other such documents. For royal use, as may be seen in the private account books of the peshwa Bajee Rao, grains of gold leaf are mixed with the pulp and thus becomes spread over the surface of the paper. China, up to the year 1840, largely supplied India with paper. But by the middle of the 19th century paper for the writing and printing purposes of Europeans was all imported into India from France and Great Britain. It is styled in commerce fine paper, to distinguish it from coarse or wrapping paper. Mahomedans in India and the hindoos who use an Indian ink, still largely write on a glazed paper the manufacture of India.

In Britain, in the five years, 1830 to 1834, prior to the reduction of the excise duty on first class papers from 3d. to its present equalized rate of 1½d. per lb., the average annual quantity made was 70,988,131 lbs.; and in the five years, 1849 to 1853, the average annual quantity made was 151,234,175 lbs. The production of the year 1853 was 177,623,000 lbs., being above 23,000,000 lbs. (more than 10,000 tons) over that of the preceding year, and more than 36,000 tons over 1834, such excess requiring for its production not less than 13,000 tons of raw material in the former case, and nearly 47,000 in the latter. The whole weight of material employed in Great Britain in the manufacture of paper only may be stated at between 110,000 and 120,000 tons per annum. The coarse kind of paper prepared by the natives in Madras, was in Ainslie's time, commonly made of old gunny bags or old fishing nets. In the process lime water and rice cunjee were em-

ployed and frequently a little Indigo to give it a blue tinge. Supposing from the whiteness and great tenacity of the Marool (or Munchie) nar that a valuable kind of paper might be prepared with it, he recommended a trial of it to the paper makers at Trichinopoly, in July 1813. They hesitated, never having heard that paper can be made from this substance, but were induced to make the experiment, and succeeded in making a much better and whiter paper than what is commonly made with old gunny bags. He could not learn that paper is ever made in India as it is in the Ava dominions, either from the bark of the paper Mulberry (*Morus papyrifera*), or from the macerated filaments of the bamboo. In the Himalayas it is made of the inner bark of *Daphne cannabina*, and in sheets of immense size. A large collection of papers was exhibited from different parts of India, but, though well adapted for writing on, in India, they are not suited for Europe, in consequence of the difference in the ink used. Most of the paper used in Thibet is made from the bark of various species of *Daphne*, and especially of *Edgeworthia Gardneri*, and is imported from Nepaul and Bhotan; but the Tibetans, as M. M. Hue and Gabet correctly state, manufacture a paper from the root of a small shrub, and it is of a much thicker texture and more durable than *Daphne* paper. Dr. Thomson informs me that a species of *Astragalus* is used in western Tibet for this purpose, the whole shrub, which is dwarf, being reduced to pulp.

PAPER, HIND., of Jhilam, *Buxus sempervirens*, box.

PAPER BIRCH, ENG. *Betula Jacquemonti*, *Spach*.

PAPER CURRENCY. The average circulation from the commencement of the Paper Currency operations has been in.—

1862-63 Rs. 4,41,94,285	1867-68 Rs. 9,28,50,848
1863-64 " 5,23,25,000	1868-69 " 10,14,55,327
1864-65 " 6,88,20,116	1869-70 " 10,66,94,777
1865-66 " 7,72,57,983	1870-71 " 9,81,32,240
1866-67 " 8,93,93,179	

and in the last two years, the maximum and minimum values of notes in circulation were—

Maximum.	Minimum.
1869-70 Rs. 11,42,07,120	Jan. Rs. 9,80,32,010
1870-71 " 10,75,53,170	April. " 8,68,19,030

For the first time in nine years the 1870-71 circulation showed a large decrease, having fallen back below what it was in 1868-69. The falling off in the main circles of Calcutta and Bombay amounted to no less than Rupees 1,32,81,417, or nearly 15½ per cent. There was a counter-balancing increase in most of other circles, which reduced the decrease on the whole to Rupees 85,58,537 below 1869-70, or a little over 8 per cent.

The Calcutta circulation reached its highest point (Rupees 4,89,53,150) on the 22nd January 1870. It then fell rapidly to Rupees 3,51,79,910 on the 31st March 1870, from which date to the end of May 1871 it showed no signs of recovery. Since then it has risen again quickly till, on the 31st October, it was Rupees 4,29,93,960, since when it has slightly fallen, it having been reduced to Rupees 4,11,43,980 on 15th December 1871.

The Bombay circulation was at its highest point in recent years (Rupees 5,03,63,280) on the 7th April 1870. By the 7th July it had fallen to Rupees 3,16,18,750. It now stands rather below Calcutta, or at about Rupees 3,67,00,000 on 15th December.

The Madras circulation rose strikingly from about Rupees 60,00,000, at the end of February 1870, to Rupees 1,15,85,270 on the 31st August 1871, having even reached a higher sum, on the 22nd June 1871. On 15th December 1871 it stood at Rupees 97,86,390.

These rather remarkable phenomena are not explained.

No less than Rupees 1,42,16,200 of Lahore and Allahabad notes were cashed in Calcutta in 1870-71, and a far larger sum in proportion (Rs. 1,53,98,020) had been so cashed to the end of August 1871. This means that in the course of seventeen months Government has had to bear the cost of the exchange on nearly Rupees 30,000,000 from Allahabad or Lahore, or, since the beginning of the year, from Bombay to Calcutta.

The Head Commissioner argues that the note remittances in the year, amounting to Rupees 3,24,58,870, caused a large saving to Government. But doubtless per contra some expense must have been thrown upon Government by notes being received instead of coins at deficit treasuries.

The net profits of the department are shown to Rs. 11,57,637, but against this amount ought to be set the cost of the exchange on Rs. 1,42,16,200 of Lahore and Allahabad notes cashed in Calcutta, and taking this cost at 4 annas per cent., the set off would be Rs. 35,540.

PAPER HANGINGS. Paper stained or printed with tasteful designs, and used for pasting on the walls of a room, &c. There are many varieties, which are manufactured in England, France, Germany.

PAPER MULBERRY.

CHIU: oh'u, CHIN: Kau sang, CHIN:
The paper mulberry, the *Broussonetia papyrifera*, is a native of the isles of the Southern ocean, as well as of China and of Japan. It has long been famous for its fibrous bark, which is made into a kind of cloth, as in Otaheiti and in the Sandwich islands, as well as into paper, in Japan. In making this paper the bark is boiled

into pulp in a ley of wood ashes, and then well washed by agitation of it in water, until it becomes like tufts of tow. If too much boiled, the paper will be weak but white; and if insufficiently washed it is coarse but strong. It is then heaped on a table and beaten into a pulp, by batons of hard wood. Mucilage obtained from boiled rice, or from a plant called *oreni*, is added to the pulp, which is stirred with a clean reed until reduced to a homogenous liquor, and when of a due consistence it is ready for conversion into sheets, see Japan, Java.

PAPER PLANT OF NEPAUL is the *Daphne cannabina*, one of the same family as the Lace bark tree, *Lagetta lintearia*, of the West Indies. *D. cannabina* is supposed to be identical with the *D. odora* of Thunberg. It is extremely abundant in the Himalaya, and the paper is made by boiling the inner bark, in a ley of wood ashes, and reducing them to pulp by beating *Daphne* or *Guidia eriocephala* is very common on the Western Ghauts, and on the hilly parts of the Southern Mahratta country and Dekhan. On a trial of the paper by an engraver, he reported it as affording finer impressions than any English made paper, and nearly as good as the fine Chinese paper which is employed for what are called India paper proofs. Dr. Campbell describes the paper as strong and durable as leather.

PAPER, RICE—Chinese rice-paper had long been supposed to be cut from cylinders of a pith which has always a central hollow chamber, divided into compartments by septa or excessively thin plates. The supposition was confirmed by Sir William Hooker receiving from China, specimens of the rice-paper plant itself, which very closely resembles, in botanical characters as well as in outward appearance of size and habit, the *Aralia Sikkim* plant. Fortune, at his first visit to the fine island of Chusan had been examining with a spy-glass some large white flowers which grew on the banks and on the hill sides, and when he reached the spot where they were growing, they proved to be very fine specimens of *Lilium japonicum*. As, he was admiring these beautiful lilies which were growing as wild as the primroses in woods in England, another plant, he says, of far more interest, caught my eye. This was nothing less than the rice-paper plant—the species which produced the far-famed rice-paper of China named by Sir W. Hooker, *Aralia papyrifera*. The largest specimens were about five or six feet in height, and from six to eight inches in circumference at the base, but nearly of an equal thickness all up their stem. The stems, which usually bear all the way up, were crowned at the top with a number of noble looking palmate leaves on long footstalks, which gave to the plant a very ornamental appearance. The under side of each leaf, its

footstalk, and the top part of the stem, which was clasped by these stalks, was densely covered with down of a rich brown colour, which readily came off upon any substance with which it came in contact. It flowers and seeds during the winter and spring months at Hong-kong and Calcutta. A few samples of the largest stems he could find, were sent to England and India. The proportion of pith in these stems is very great, particularly near the top of vigorous growing ones, and it is from this pure white substance that the beautiful article erroneously called "rice-paper" is prepared. The Chinese call this plant the Tung-tsaou. What it was, or to what part of the vegetable kingdom it belonged, was long a mystery to botanists. The Tung-tsaou is largely cultivated in many parts of the island of Formosa, and with rice and camphor forms one of the chief articles of export. Mr. Bowring, who read a paper upon the rice-paper plant, before the China branch of the Royal Asiatic Society, informs us that the Canton and Fokeen provinces are the chief consumers, and that the town of Foo-choo alone is supposed to take annually not less than 30,000 dollars' worth of this curious and beautiful production. The cheapness of this paper in the Chinese market, as Mr. Bowring justly remarks, is evidence of the abundance of the plant in its place of growth, and more especially of the cheapness of labour. "That 100 sheets of this material (each about three inches square), certainly one of the most beautiful and delicate substances with which we are acquainted, should be procurable for the small sum of $1\frac{1}{4}d.$ or $1\frac{1}{2}d.$, is truly astonishing; and when once the intention of foreigners is directed to it, it will doubtless be in considerable request among workers in artificial flowers in Europe and America, being admirably adapted to their wants." The larger sheets, such as those used by the Canton flower-painters, are sold for about $1\frac{1}{2}d.$ each. If the Tung-tsaou prove hardy, in England, its fine foliage will render it a favourite amongst ornamental plants in English gardens. Judging, however, from its appearance when growing on its native island, and from the temperature of Formosa, Fortune feared we cannot expect it to be more than a green-house plant in Britain. Before he left China, it had been completely naturalised on the island of Hong-kong. It is really a most striking looking plant and highly ornamental. At all times the fine, broad palmate leaves which crown the stem have a noble appearance, and in the winter months its large panicles of flowers make it more interesting. The paintings on Chinese pith paper, or rice-paper, as it is commonly but incorrectly called, are much sought after for their splendid colourings. Its velvety surface contrasts admirably with brilliant

colours; it is a delicate vegetable film, consisting of long hexagonal cells whose length is parallel to the surface of the film, and which are filled with air when the film is in its usual state; the peculiar softness which so well adapts it for receiving colours is owing to this structure. The pith is carefully taken out and cut in sheets by running a knife around it, and smoothing them with an iron. When the tissue breaks, the fracture is connected by a lamina of mican. An india-ink outline is first transferred by damping and pressing it upon the paper, when the ink strikes off sufficiently to enable the workman to fill up the sketch; one outline will serve for limning several copies, and in large establishments the separate colours are laid on by different workmen. The manufacture of these paintings at Canton employs between two and three thousand hands. Another tissue sometimes used by the Chinese for painting, more remarkable for its singularity than elegance, is the reticulated nerve-work of grape leaves, the fleshy green part of the leaf having been removed by maceration, and the membrane filled with isinglass. The appearance of a painting on this transparent substance is pretty, but the colours do not retain their brilliancy.—*Williams' Middle Kingdom*, Vol. ii, p. 145; *Eng. Cyc.*; *McCulloch's Com. Dic.*, p. 873; 4. *Res. among the Chi.*, p. 231.

PAPER-NAUTILUS, a mollusc, one of the Octopoda. See Nautilus.

PAPHI, HIND. *Helicteres scabra*.

PAPHRA, PUNJ. *Fagopyrum esculentum*.

PAPIRI, or Suk-chain, HIND., *Pongamia glabra*.

PAPIER, GER. Paper.

PAPIER MACHE. A name properly applied to articles composed of paper-pulp, boiled in a solution of gum or size to give it tenacity, and then pressed into moulds; though the term is also applied to trays, snuff-boxes, and other things made by glueing several piles of paper together, and then varnishing. It is made in the Punjab.—*Faulkner*.

PAPIERS, DUT. Paper.

PAPILIONIDÆ, *Leach.*, the butterfly family of the order Lepidoptera, *Linn.*, comprising the following genera, viz.,

<i>Ornithoptera</i> , <i>Boisd.</i>	<i>Thestias</i> , <i>Boisd.</i>
<i>Papilio</i> , <i>Linn.</i>	<i>Hebomoia</i> , <i>Hubn.</i>
<i>Pontia</i> , <i>Fabr.</i>	<i>Eronia</i> ,
<i>Pteris</i> , <i>Schr.</i>	<i>Callidryas</i> , <i>Boisd.</i>
<i>Callosone</i> , <i>Doubl.</i>	<i>Terias</i> , <i>Swain.</i>
<i>Idmais</i> ,	

The genus *Papilio* includes all the butterflies. The first section of Lepidoptera, named Rhopalocera (club-horned) in the arrangement of Boisduval, and Diurna in that of Latreille, corresponds with the Linnæan genus *Papilio*. The insects composing it have mostly thin and elongated antennæ terminated by a club. They

are all day-fliers. Their larvæ, which are variously shaped, have six pectoral, eight abdominal, and two anal feet. The pupæ are usually angulated and, with a few exceptions, naked. The perfect insect varies in size from less than an inch across the wings when expanded, to nearly a foot in breadth. Equally variable are their colouring and outlines. They are short-lived. Their powers of flight are very great, and the mode of flight varies in the several species. The males are usually more gaily coloured than the females. The Papilionidæ or swallow-tailed butterflies, from their large size and gorgeous colouring are more frequently collected than other insects. There are known to be 27 species in Java, 29 in Borneo, and 21 in Sumatra. A Papilio with blue black above and large spots of bright blue, occurs in Amboyna. It has an expanse of 5 or 6 inches. *Tachyris zarinda* is a rare butterfly, with cinnamon red wings. *Idea tondana*, a semi-transparent butterfly of Celebes. *Papilio androcles*, one of the largest and rarest of swallow-tailed butterflies. *Cicindela heros*, and *C. gloriosa* also occur, the latter of a rich velvety green colour.—*Eng. Cyc.*; *Wallace*, p. 147.

PAPILIO MACHAON. Choongtam in Sikkim boasts a profusion of beautiful insects, amongst which the British swallow-tail butterfly (*Papilio machaon*) disports itself in company with magnificent black, gold, and scarlet-winged butterflies, of the Trojan group, so typical of the Indian tropics.—*Hooker's Him. Jour.*, Vol. ii, p. 26.

PAPILIO POLYMNESTOR, see Butterfly.

PAPILIO ULYSSES, one of the largest of the tribe is common at Amboyna. It flies with a rather weak undulating motion.—*Wall.*, p. 297.

PAPIN, see Khyen.

PAPIONINÆ, a sub-family of mammals, including the true baboons of Africa and the monkey-like baboons of India, viz.

Inuus silenus. Lion monkey.

<i>Simia leonina</i> ,	<i>Shaw.</i>	<i>Silenus veter.</i>	<i>Gray.</i>
" <i>silenus</i> ,	<i>Linn.</i>	<i>Horsf.</i>	<i>Blyth.</i>
<i>Nella-manthi</i> ,	<i>Mal.</i>		
<i>Nil-bandar</i> ,	<i>BENG.</i>	<i>Siah-bander</i> ,	<i>HIND.</i>

The lion monkey is a native of the more elevated forests of the Western Ghats of India, from N. L. 15½ to the extreme south, but most abundant in Cochin and Travancore. It does not occur in Ceylon, and though called so by Buffon it is not the wanderer, which is a species of presbytes. It is of a somewhat sulky and savage disposition and is with difficulty taught to perform any feats of agility, or mimicry.

Inuus rhesus. The Bengal monkey.

<i>Macacus rhesus</i> ,	<i>Desm.</i>	<i>Pithecus oinops</i> ,	<i>Hodge.</i>
<i>Inuus erythræus</i> ,	<i>Schreb.</i>		<i>Horsf.</i>
<i>Morkot</i> ,	<i>BENG.</i>	<i>Piyu</i> ,	<i>BHOT.</i>
<i>Banur</i> ,	"	<i>Bandar</i> .	<i>HIND.</i>
<i>Marcut banur</i> ,	"	<i>Suhu</i> ,	<i>LEPCH.</i>

This is the common monkey of all N. India

extending up to 4,000 and 5,000 feet in the Himalaya, and south to about N. L. 18 or 19 to Goomsoor and near Nagpore. It frequents all the forests and groves in the open country, and in northern India, may be seen in many towns and villages. It is very easily tamed and made to exhibit various feats of agility.

Inuus pelops. The Hill monkey.

<i>Macacus pelops</i> ,	<i>Hodgson.</i>	<i>M. assamensis</i> ,	<i>M. Lal-land.</i>
		<i>Horsf.</i>	<i>Blyth.</i>

Occurs in Assam and Darjeeling.

Inuus nemestrinus of Tenasserim, Malaya.

Inuus leoninus, *Blyth.*, of Arrakan, perhaps the same as *In. arctoides* of *Is. Geoff.*

Macacus radiatus. The Madras monkey.

<i>Cercopithecus radiatus</i> ,	<i>Simia sinica</i> ,	<i>Linn.</i>
	<i>Kuhl.</i>	<i>Elliot.</i>
		<i>Blyth.</i>

<i>Munga</i> ,	<i>CAN.</i>	<i>Makadu</i> ,	<i>Wanur</i> ,	<i>Keda</i> ,
<i>Bandar</i> ,	<i>HIND.</i>			
<i>Vella munthi</i> ,	<i>MLLEAL.</i>	<i>Koti</i> ,		<i>MAHR TR.</i>

The Madras monkey is to be seen all over the southern parts of India extending north to N. L. 18° where it is replaced by *Inuus rhesus*; it lives in the dense jungles, also in populous towns and carries off fruit and grain from the dealers with great coolness and address. It is the monkey most commonly met in menageries and led about to show feats of agility. It is the most inquisitive and mischievous of its tribe.

Macacus pileatus, *Shaw.*, of Ceylon, is the *Simia pileatus*, *Linn.*

Macacus cynomolgus, *Linn.*, of Burmah.

Macacus carbonarius, *F. Cuv.* *Jerdon's Mammals.*

PAPIO NEMESTRINUS, *Erxl.* Syn. of *Macacus nemestrinus*, *Linn.*

PAPIO RHESUS, *Ogilby.* Syn. of *Macacus rhesus*, *Audeb.*

PAPISRANG. Pinang, has two woods of this name, viz.

Papisrang, purple colour. A strong wood; used for beams.

Papisrang, wood of a pale brown colour. six to nine feet in circumference, forty feet long; not good for beams; chiefly used for furniture.—*Colonel Prith.*

PAPITA, *HIND.* *Strychnos faba*, *Strychnos Sancti Ignatii.*

PAPLI CHUCKAY, yields an orange dye.

PAPNAS, a river near Tappah in Bhopal.

PAPOA UMBBALAY MARAM, *MLLEAL.* *Carica papaya*, *Linn.*

PAPOO KOORA, *TEL.* *Chenopodium album.*

PAPPALI MARAM, *Carica papaya*, *Linn.*

PAPPANA, *SANS.* *Pavetta indica.*

PAPPAR, *HIND.* *Buxus sempervirens.*

PAPARA CHETTU, *TEL.* Brown quotes the syns. *Parnika* and *Parni*. The latter according to W. 516, is *Butea frondosa* also *Pistia stratiotes*. The word means "bark-tree."

PAPPATI. The new year's day of the Zoroastrians, by whom it is strictly kept as a festival.

It is celebrated in honour of Yezdejird : on this day, the Zoroastrians rise early, dress in new clothes, and after prayers in their households or temples, pass the day in congratulatory visits and entertainments.—*The Parsees*, p. 60.

PAPPEL PAPPELHAUM, GER. Poplar.

PAPILLI, TAM. See Dyes.

PAPPISA, TEL. A tree, the Tamarisk ?

PAPPOIA-UMBALAY MARAM, MALEAL.

Carica papaya, Linn.

PAPPREE, HIND. A natro salt obtained from the Lake of Loonar, used in the manufacture of bangles.

PAPPU KURA, TEL. *Chenopodium album*, Linn., Roxb.

PAPPUTTA. *Pavetta indica*.

PAPRA also Paprang, HIND. *Salvia lanata*.

PAPRA, HIND. *Fumaria parviflora*.

PAPRANG, or Chikri, HIND., of Kanawar, *Buxus sempervirens*. The Box-wood tree.

PAPRI, HIND. A substance found at one stage of the manufacture of Sal-ammoniac.

PAPRI and pappar, HIND., of Salt Range, *Buxus sempervirens*.

PAPRI, HIND. *Podophyllum emodi*, also *Myrsine Africana*, *Buxus sempervirens*, *Ulmus integrifolia*.

PAPUAN. The Papuans are oriental negroes, in the interior of New Guinea, and in the islands northwards to the Louisiade Archipelago. They are called by Mr. Muller, Mairassie, and by Lieutenant Modera, Alföeren or Alföer, but the ordinary term by which they are known to Europe is derived from the words pua-pua which means frizzled, their frizzled spiral hair being a marked feature in their physical appearance. There are, however, in other regions, other races with markedly negro features, and some ethnologists believe that southern India once had a negro population. The Papuan race extends from New Guinea eastward through the Louisiade and Solomon Archipelagos to the New Hebrides where it co-exists with some tribes of Malaya-Polynesians, and still further to the Fiji islands which, however, are the extreme limit of the race in an Eastern direction. The Fijians are the aristocracy of the race. In a south direction the Papuans have evidently spread far and wide over the continent of Australia and occur even in Van Diemen's Land, though their characteristics are greatly modified. To the present day, many of the Non-Aryan tribes in India have features resembling those of some Negro races of Africa. In the south Indian population, as a whole, amongst the people speaking the Tamil language, the bridge of the nose is generally less prominent than in the Iranian, and much more so than in the Turanian. Even where the root of the nose, between the eyes, sinks in, the upper

line, as a whole, is much more thrown out from the face than in the Turanian head, so as to render the point comparatively sharp and prominent. The alae have an upward expansion, leaving the upper part of the septum exposed and the elongated nares open and conspicuous. This is a Semitico-African trait. In the Turanian, the septum is contracted and thickened at the base, pulling down the point of the nose or rendering it low and obtuse, forcing the nares to spread out laterally and making the nares rounded. The eyes in the Dravidian are large, are of full size, horizontal and well-separated, and the beard is generally sufficiently strong. The Africao-Papuan pyramidal nose, with a deep and sharp sinking in at the root, is common, particularly in some of the lower castes, in which the colour is nearly black. Mr. Logan thinks it probable that this lower and apparently the more normal southern type characterised the whole population of India at one period. Amongst the Vindhians, some tribes are found who seem to approximate to it such as the little ill-favoured Tamariah the neighbours of the Ho and the short and jet black Surah who are spread for 200 miles from the hilly southern side of the basin of the Ganges along the eastern face of the ghauts to the Godavery and are much, in person, in civilization, akin to the gangetic population. The Chensuar, a half savage, wild tribe, who occupy the western portions of the continuation of the ghauts between the Pennar and the Kistna, and who are probably a continuation of the Surah, are described by Captain Newbold as being between a Telugu and Jakun of the Malay peninsula. The Chenchwar are known to their settled neighbours as the Chenchu-Kulam, Chenchwar and Chensuar. They are about 1,200 in number, and dwell in the tract of jungle covering the westernmost range of the eastern ghaut line, between the Pennar and Kistnah, and known locally as the Nulla mulla and Lanka-mulla. In the pass from the Kuman to Badwail, a few are employed as hill police. They inhabit clearings in the forests, live in beehive-shaped huts, of wicker work, walls about three feet high and a conical straw roof, with a screen for a door, like the huts of the African, Nicobarian, and many of the ruder Asianesian tribes. The men are almost nude. They have large dogs. The women dress like the wandering female basket makers whom they resemble in features. The features of the men are small and animated; cheek bones higher and more prominent than in the hindoo in general. Nose flatter and nostrils more expanded. Eyes black and piercing, and in stature shorter than their neighbours. Their hair is more shaggy and less straight than that of the hindoo, and they wear it very long and rolled up at the back or

near the crown like that of a woman. They are slightly, but well-made, except about the knee, which is large, and the leg. The colour of the skin is darker, and there seemed a tendency to cutaneous eruptions. They speak Telugu with a harsh and peculiar pronunciation. They have no language of their own. Brahmans say they formerly were shepherds of the Yerra Golla caste. The Nandial Chenchwars assert their ignorance of a god or soul. They have no images. They are polygamists. They bury their dead, but sometimes burn: and the Nandial Chenchwar like the Tartars carry the deceased's weapons to the grave. They are divided into little tribes. They have in general only a rag for covering. They use the spear, hatchet, or matchlock, or a bamboo bow and reed-arrow tipped with iron. They are patient and docile. They look on weaving and other manufacturing arts with contempt.

The Jakun of the Malay peninsula, is the most African and prognathous of the lank-haired Indianesians tribes.

In the Neilgherry hills, the Kurambar and Erular belong to the same low type. In the ghauts of the northern part of the peninsula, the Koli, Ramusi, Bedor, Warali, Katadi or Katkar tribes appear to be allied to the lower type, but in general the African element has been eliminated. One of the most African of these petty northern tribes is the Katadi. They are of a deep black colour, and Mr. Vaupell describes them as being more like monkeys than any race of men he ever saw. The Warali are more slender and somewhat darker than the common Mahratta. The sequestered tribes of Southern India appear to belong chiefly to the lower form. In some cases they approximate to the more Turanian-African type, in which the nose is flatter, the beard scanty and the person shorter. There is so considerable a difference between this type and the more Semitic, that whatever may be the original relationship of the two, it is necessary to recognize both as existing in India at the earliest era which ethnology can descry. A similar phenomenon presents itself on the western side of the Indian ocean, and what is still more important with reference to India, it is found also in the Negro population of the eastern side. Many of the eastern tribes are very short and slender, small-eyed, flat-faced, and beardless: while others are middle-sized and even tall and robust, with the Semitico-African beards, aquiline or pyramidal noses, raised nares and large eyes, of the other archaic types of Southern India. Both types preserve a black complexion, alike in Africa, India, the Andamans, the Malay Peninsula, the Malay Polynesian Islands, and Aus-

tralia, although modifications of colour also occur throughout this area. Mr. Logan thinks that little weight is to be attached to the absence of spiral hair in S. India, for some of the spiral-haired Papuan tribes of New Guinea and Torres Straits are often more Africo-Semitic and S. Indian in their physiognomy than the Australians, while the latter have the fine hair of S. Indians and some Mid-African nations and a linguistic formation which resembles the S. Indian more than any in the world. In Australia and the various Papuan and partially Papuan Islands, the African element has been maintained from the comparative isolation of the tribes. In the Gangetic province, as in the greater portion of Ultra-India, including the Malay Peninsula, the intrusive race appears to have been recruited by the entrance of new tribes from the north-east and to have ultimately assimilated the native race, although the influence of the latter is still slightly perceptible. When we consider the position of India, between the two great negro provinces, that on the west being still mainly negro, even in most of its improved races, and that on the east preserving the ancient negro basis in points so near India as the Andamans and Kidah, it becomes highly probable that the African element in the population of the Dekhan has been transmitted from an archaic period before the Semitic, Turanian and Iranian races entered India, and when the Indian Ocean had negro tribes along its northern as well as its eastern and western shores. The basis of the present population of the Dekhan seems to have been of an African character which was partially improved by Turanians or Irano-Turanians and Semitico-Turanians from the N. W. and afterwards by more advanced ancient N. E. African and Semitic settlers. Perhaps all the original population of southern Arabia and even of the Semitic lands generally, was once African; and the Semitic race descended on them from a tribe located in the mountains at the head of the Euphrates. From the time when the adjacent shores of the Indian Ocean began to be the seats of general, commercial and maritime nations, the peninsula must have been exposed to the regular influx of foreign traders and adventurers. From the antiquity of the Egyptian civilization, it is probable that the earliest commercial visitors were Africans from eastern Africa or southern Arabia. It is certain that the subsequent Semitic navigators of Arabia at an early date established that intercourse with India which they have maintained to the present day. The trade between India and the west, appears to have been entirely in their hands for about 3,000 years. During this period, the Arab navigators not only remained for some months in the Indian

ports, between the outward and home voyages, but many settled in them as merchants. Mr. Logan thinks that the influence of African and Arabic blood must have preceded that of Arian in the peninsula. In after ages, the Arian ingredient in the peninsular population became considerable, but it has not modified the native races of the peninsula in the same degree as it has done the Bengali. The languages are still essentially distinct and the non-Arian physical element remains strong. In Southern India, are languages of one formation which is broadly distinguished from the Arian or Sanscrit on the one side, and from Tibetan and Ultra-Indian, on the other. Physically, the population of Southern India is one of the most variable and mixed which any ancient archaic province displays. The number of varieties amongst the people being too great to allow of their being referred to a single race of pure blood. Some are exceedingly Iranian, more are Semitico-Iranian, some are Semitic, others Australian; some remind us of Egyptians, while others again have Malaya-polynesian and even Simang and Papuan features. Yet when the eye takes in the whole group at once, they are seen to have all something in common. They are not Iranians, Polyne-sians, Papuans, &c., but South Indians. The strong Africanism of some of the lower South Indian castes, therefore, seems to be the remnant of an archaic formation of a more decided African character. In certain of the classes of Southern India, in which the complexion is fairer, an Egyptian style of features is not unfrequently observable. In this, the nose is not indented at the root. It is long and slightly curved; the eyes almond-shaped and slightly oblique and the chin is short. In general, the physiognomy is more the Iranian than the East African and Egyptian. Where the Arian or Semitic crossing is not striking, the person is generally rather small and slender, the legs in particular being very thin, compared with those of the Gangetic race. The colour varies from black to different degrees of brown and yellowish brown, in general contrasting strongly with the Ultra-Indian and Indonesian races. There is a tendency to certain peculiar physical traits neither Ultra-Indian, Tibetan nor Arian, but seem to be East African. The typical East African head is removed both from the exaggerated prognathous form, prevalent amongst the Guinea negroes and the highly Semitic form characteristic of tribes that have been deeply crossed by Arab blood, and is in some respects intermediate between the Iranian and Turanian, while it has specialities of its own. The cheek bones are often much more prominent than in the Iranian; and less so than in the typical Tura-

nian, the projection being frequently anterior more than lateral. The lips are full or turgid and turned out, frequently with sharp edges. Slightly prognathous heads are not infrequent.

Writing on the leading characteristics of the Papuan, Australian, and Malaya-Polynesian nations, Mr. G. Windsor Earl says that the existence of a Negro race in the Indian Archipelago, so remote from the continent which is considered as the original seat of the race, has given rise to endless speculations as to how they get there, and probably will continue so to do until the end of time, for being a nation without a written language and surrounded by others whose records are carried back to no very distant date, and whose traditions have become, from lapse of time, mere fables, this point can only rest upon circumstantial evidence, and therefore will ever prove liable to dispute. Their position in many of the larger islands as occupants solely of the mountain fastnesses, surrounded by people who evidently belong to a distinct race, has certainly put an end to those theories of the last century which attributed their origin to the shipwrecked crews of Arabian slave-vessels, and has led to a very general opinion that they were, in fact, the aboriginal inhabitants of the countries in which they are found. That their existence was not altogether unknown to the ancients is proved by the maps and writings of Ptolemy, the Alexandrian, who flourished soon after the commencement of the Christian era, and was the first to reduce geography to a system. In the last map of his volume, that which contains the "Aurea Chersonesus" and the "Tabades Insulæ," (supposed to have meant respectively the Malayan Peninsula or Sumatra and the Java Islands) he places a country far to the eastward of the Aurea Chersonesia, under the equinoctial line, which he states to be occupied by "Æthiopes Ichthyophagi," or "Negro fish-eaters;" the first term being that employed by the Romans to distinguish the black and woolly haired Africans from the Mauritanian and other brown races of the east; and the second, that usually applied to all nations who derived a portion of their subsistence from thesea. The position of the country named by Ptolemy, with regard to the Aurea Chersonesus, agrees well with that of New Guinea, the great seat of the Papuan race. The existence of a negro people, at so remote a spot, which he must have learned from the information of Indian navigators, seems, indeed, to have led Ptolemy into the great error of his system, for believing that the country of the "Æthiopes Ichthyophagi" formed part of the continent of Asia, and he has made that continent, in his general map of the world, come round by the south and join the African continent about Point Prassum, in latitude

15° S. (the then southern known limit of the east coast of Africa), thus making the Indian Ocean and the seas of the eastern Archipelago, form one vast inland sea.

With regard to the general disposition of the Papuans, a great difference is found between those living in a state of independence, and those who exist in bondage among the neighbouring nations. The former are invariably found to be treacherous and revengeful, and even those who have long been accustomed to intercourse with strangers, the tribes of the north-west coast of New Guinea, for example, are never to be depended upon, and the greatest precautions are always taken by those who visit them for purposes of trade. The wilder tribes generally avoid intercourse with strangers, if the force which hinds is sufficiently great to cause alarm, but if otherwise, they pretend friendship until opportunity occurs, when they make a sudden and ferocious attack. But what distinguishes them most from their neighbours the Malayu-Polynesians, and even from the Australians, is the unextinguishable hatred they bear towards those who attempt to settle in their territory, and which is continued as long as a man of the tribe exists. It is, probably, this perfectly untameable nature that has led to their utter extermination in all those islands of the Indian Archipelago that did not possess mountain fastnesses to which they could retire to lead a life similar to that of the Boschmen of South Africa. There have been recent instances of this in Van Dieman's Land, Melville Island (N. W. coast of Australia) and at Fort Du Bus on the west coast of New Guinea, in all which settlements the country was occupied by a pure or nearly pure Papuan race. In the former, hostility was continued as long as a native remained on the island, and in the two last, until the settlements were abandoned in despair. On the other hand, their neighbours, the Australians, have invariably submitted after a single trial of strength, while the Malayu-Polynesians, when not under the influence of other foreigners, have always evinced a desire to have strangers, especially Europeans, settled among them, as shewn by the people of the Moluccas when first visited by the Portuguese, and as displayed at the present time in those remote parts of the Indian Archipelago where the race maintains its ancient purity. The untameable ferocity of the Papuans only exists as long as they remain in their native country. On leaving it their character seems totally changed, as far as regards this particular. The Papuan slaves who exist in great numbers in the eastern parts of the Archipelago are remarkable for their cheerful disposition and industrious habits, and nothing could exceed the orderly conduct of the remnant of

the Van Dieman's Land natives after they had been hunted down, and removed to an island in Bass' Strait. Certain of the Papuan customs which distinguish them from the Malayu-Polynesians, and certainly are of Papuan, or at least of Negro origin. One of these is the custom of raising the skin in cicatrices over various parts of the body, especially on the shoulders, breast, buttocks, and thighs. This must not be confounded with the tatooing or puncturing the skin which is practised by many of the Malayu-Polynesian tribes, and which is never met with among the Papuans, as the scarifications about to be described are unknown to the others. The skin is cut through with some sharp instrument in longitudinal stripes, and, if on the shoulder or breast, white clay, or some other substance, is rubbed into the wound, which causes the flesh below to raise, and these scarifications, when allowed to heal, assume the form of raised cicatrices, often as large as the finger. The process by which these cicatrices are produced and which Mr. Earl had opportunities of watching in their progress from day to day until duly formed, is perfectly inexplicable to an European, who would be thrown into a fever by any one of the wounds which these strange people bear, two or three at a time, without complaining, but certainly not without suffering. It is, however, quite evident that the Papuans, and also the Australians, possess a callousness of skin, or insensibility of pain, which is quite unknown among more civilized races. Boring the septum of the nose is universally practised among the Papuans. In the first instance they wear a roll of plantain leaf in the orifice which by its elasticity enlarges it to a sufficient size to admit the thigh bone of a large bird, or some other ornament, which is then worn extending across the face on all great occasions. British sailors have a very quaint name for this practice, which often comes under their observation among the Papuan islands of the Pacific; they call it "sprit-sail yarding," after a cruel method they have of treating sharks and dog-fish, which are frequently let go after having been hooked, a piece of wood being previously thrust through their nostrils, which projecting on either side, prevents them from getting their heads under water, and they die a lingering and painful death. Mr. Earl had never met with, or heard of, this practice of boring the nose among people of the Malayu-Polynesian race, and he says the same with regard to the scarifications mentioned above. The latter, or rather those among them who are sufficiently barbarous to resort to personal disfigurement, seem to have adopted tatooing and boring the ears in lieu of the more coarse and painful ornamental work of the Papuans.

Filing or grinding down the front teeth until they become pointed is practised by some of the tribes of New Guinea and of the adjacent islands of the Pacific. This custom, however, is not confined exclusively to the Papuans, as it is practised also at the Pagi islands, on the west coast of Sumatra, the natives of which appear to be Malayu-Polynesians. This custom must not be confounded with one which is common among many of the Malayan and Bugis tribes, that of grinding down the front teeth until they become almost level with the gum. Another singular custom which is only met with among the Papuans, or the tribes closely bordering on them, is that of dyeing the hair (which is naturally black) a reddish or flaxen colour, by using applications of burnt coral and sea-water in some instances, and preparations of wood ashes in others. This process seems to expel all the dark colour from the hair, leaving it of a flaxen tinge which appears to bear a close resemblance to the celebrated "capillus flavus" so much admired among the Roman ladies and which seems to have been produced by a similar process. The only Malayu-Polynesians whom Mr. Earl had known to practice this custom are some of the natives of Timor Laut, Sermatten, and Baba islands lying to the westward of New Guinea and not very remote. He was therefore induced to consider it as a Papuan, or rather, perhaps, as a "Negro" custom, for it is equally prevalent in many parts of Africa, especially among the Somali and other tribes in their neighbourhood. All travellers who have had opportunities of visiting Aden will have observed this custom among the African coolies employed in coaling the steamer, who sometimes appear with the plaster of coral still attached to their heads.

The Papuans, for the most part, exist only in a savage state, deriving a scanty subsistence from the productions of nature, living in conical shaped huts; or where they appear as occupants of the sea coast, roaming about in small canoes in search of food. Some of the more independent tribes, by which is meant those who have exclusive possession of the country they inhabit, have, however, adopted many improvements. In several parts of the north and of the south coasts of New Guinea, the villages consist of one large house, erected on piles, and occupied by all the married people, with a smaller one adjacent for the bachelors. These houses bear a very close resemblance to those of the Dyaks of Borneo, but are smaller and of more rough construction. Here the Papuans also cultivate fruits, yams, and sweet potatoes and keep hogs and poultry to kill for food, in fact are almost on a level, as far as regards agriculture, with the more uncivilized tribes of the Malayu-Polynesians, from whom,

indeed, if we may judge from the names employed to designate their agricultural productions, they have derived this slight, but important advance they have made in civilization. The weapons of the Papuans are heavy wooden clubs, spears or lances of nibong or other hard wood, and darts formed of a small kind of bamboo, provided with points of hard wood or of sharpened bone. The lances are projected generally by means of a becket of sennit about a foot and a half long, one end of which is provided with a toggle. This is held between the fingers, while the other end is fastened to the lance with what sailors call a "half-hitch" knot, which flies off when the lance is projected, thus allowing it to go free. The becket gives a greatly increased purchase to the thrower, but is much inferior in this respect to the womera or "throwing stick" of the Australians. The darts are projected by means of a powerful bow, often six feet in length, with a bow-string of rattan. Mr. Earl suspects that this instrument was not originally Papuan, but has been adopted from the Polynesians. Stone axes, and knives of quartz are now superseded, among all those tribes who have either direct or indirect communication with the traders of the Archipelago, by Parangs, or Chopping-knives of iron. Their agricultural instruments are mere stakes of wood, sharpened at one end, which prove sufficient to effect the rude interference with nature required by their mode of cultivation. The art of navigation appears never to have been in a very advanced state among the Papuans, since their navigation has only extended to those countries which could be reached from the continent of Asia without entailing the necessity of going out of sight of land, nor are they yet sufficiently advanced in the science of navigation to venture on any other than coasting voyages. Towards the eastern limits of the Papuan race, where they come in close contact, and are often mixed with the Polynesians, navigation is in a more advanced state than elsewhere, but this is evidently the result of contact with strangers, by whom, indeed the navigation is personally conducted. The highest state of the art among the Papuans, without foreign assistance, is met with in Torres Strait and upon the south coast of New Guinea. Here they possess large canoes of such construction and propelled in so peculiar a manner, that we must consider them purely Papuan. Some very excellent sketches of these canoes with a full description are given in Flinder's Voyage. These canoes or boats are from thirty to forty feet long, and the planks with which they are constructed are sewed together with the fibres of the cocoanut. Each is provided with an outrigger, and a platform of bamboo occupies the centre of the boat on a level with the gun-

wale. They are propelled in calm weather by paddles with long handles, the rowers all standing, as is generally the case among the Papuans. But the most striking peculiarity of these vessels consists in the sail, which is an oblong piece of matting set up in the fore parts of vessel by means of two poles or masts, to which the upper corners of the sail are fastened. These masts are moveable, and the sail is trimmed by shifting the head of one of the masts aft. According to Mr. Earl's experience these boats sail very indifferently, except before the wind, but Captain Flinders, who had good opportunities of judging, maintains a more favourable opinion. They are often to be met with about the month of March three or four hundred miles down the north-east coast of Australia, the islanders being in the habit of making an annual voyage in this direction. The stopping places are usually the islands lying off the coast, where they obtained tortoise-shell and trepang, the chief objects of their voyages. The natives of the south coast of New Guinea have very large canoes of a similar but more unwieldy construction, and propelled by a similar description of sail. These have never been seen far from the coast, and in fact are almost unmanageable from the difficulty experienced in steering such unwieldy masses with paddles alone. It is therefore difficult to conceive for what purpose they have been constructed, unless it should be for war, in which case their large size would give them an imposing appearance. The New Guinea canoes generally are of light construction and are provided with an outrigger. The larger ones have an attap roof and are capable of containing an entire family, with household furniture and domestic animals.

In a north-west direction from New Guinea, the Papuan race extends through the Moluccas, the Philippines and possibly to Borneo, but in these islands they only appear in small and scattered tribes occupants of the mountain fastnesses.

The small islands which extend from New Guinea to Timor, with the exception of the Arru islands, are occupied by Malayu-Polynesians of the most decided character, but at Timor, especially near the north-east end, a race evidently of Papuan origin again appears, but never, so far as Mr. Earl been able to ascertain after strict enquiry, in an absolutely pure state. These tribes are much oppressed by the Malayu-Polynesians who occupy the table-land of the interior, and the slaves which are brought down to the settlements on the coast, and were formerly exported to Macao and other places, were chiefly of this race, which has led to very erroneous impressions with regard to the nature of the inhabitants of Timor on the part of those who have only met them at Macao, where

the Negro character naturally prevails among them. Some tribes on the great island of Flores or Mangarai assume a more decided Papuan character, and there is said to be also a tribe of these people in the neighbourhood of the Timboro mountain on Sumbawa; but beyond this they disappear, and are not encountered again until we meet them on the Malayan Peninsula under the name of Semang, occupying some mountain tracts in the states of Kidah, Perah and Kalantan. The Andaman islands in the Bay of Bengal are occupied by a people of most decided Papuan character, who bear indeed, a very striking resemblance to the natives of Van Diemen's Land. Hence they can be traced no further, unless the analogy recently discovered by Mr. Norris, the Assistant Secretary of the Royal Asiatic Society, between the Tamil language of the Coromandel coast and some of the Australian dialects may lead to the establishment of an affinity between the nations that use them.

The Andaman islands lie in the direct track of ships navigating the eastern side of the Bay of Bengal, and have been twice actually occupied by a British establishment. Their inhabitants have the feeling of hostility and aversion towards strangers which is common to all the wilder Papuan tribes. A very full account of them, is given in one of the earlier volumes of the "Asiatic Researches," and also in Colonel Symes' Embassy to Ava. Their limbs are spare and ill proportioned, their bellies protuberant, the complexion black and the hair woolly. They have also a taste, so characteristic of the wilder Papuans, for daubing their heads with red ochre. They have canoes, but use small rafts when they wish to visit the islets. Both sexes go entirely naked, for the pieces of fringe that they wear about are rather intended for ornament than as a covering. They obtain fish by descending to the shore at low water and spearing those that are left among the reefs by the receding tide; or by catching them with small hand-nets, and depositing them in long wicker baskets which they carry slung from their shoulders. All these are characteristics of the wilder coast Papuans, especially those of Van Diemen's Land to whom indeed the Andamans bear a resemblance so striking as to excite surprise that two tribes who must have been separated during many ages, and who reside in climates so different, should be distinguished by precisely the same characteristics. The only point of difference that can be detected, consists in the knowledge on the part of the Andamans of the use of the bow and arrow, which was either never known to the Van Diemen's Land natives or has been neglected in favour of the dart or throwing spear, which is far

better adapted to the open nature of their country.

The Papuans of Dory worship, or rather consult, an idol called "Karwar," a figure rudely carved in wood and holding a shield, with which every house is provided. The idol which is usually about eighteen inches high, is exceedingly disproportioned, the head being unusually large, the nose long and sharp at the point, and the mouth wide and well provided with teeth. The natives have also a number of "Fetishes," generally carved figures of reptiles, which are suspended from the roofs of the houses, and the posts are also ornamented with similar figures cut into the wood.

Within the geographical limits of the Indian Archipelago, the Papuans only appear as inhabitants of the sea coast in New Guinea and the islands immediately adjacent. In other parts of this region they are found only among the mountain fastnesses, maintaining an unequal struggle with the brown races by whom they are surrounded. In some of the Spice islands, the group nearest to New Guinea, "their extirpation is matter of history," as observed by Mr. Crawford in his valuable "History of the Indian Archipelago," vol. i, p. 18. In Ceram and Gillolo a few scattered remnants of the race still exist; but they hold little or no intercourse with their more civilized neighbours, flying into the thickets which afford them shelter and concealment on the first appearance of a stranger, experience having taught them that death or captivity will be their fate if they fall into the hands of their natural enemies. The characteristics of the mountain Papuans must therefore be sought in those islands where their numerical strength permits them to lead a life more fitted for human beings than that of their hunted brethren. It is an error to suppose that these Negro races disappear before civilization. Their chief destroyers are the wild and warlike hunting tribes of the brown race; and, excepting the case of the Moluccas, wherever European civilization has been introduced, the Papuans are more numerous than elsewhere. In the Philippines, for example, according to an intelligent modern traveller, their number in the year 1842 amounted to 25,000 souls. (Mallat, "Les Philippines," &c., vol. i, p. 97, Paris, 1846.) The large island of Moysol or Mæsal, which lies nearly midway between the north-western extreme of New Guinea and Ceram, is said to have been occupied exclusively by Papuans when this region was first visited by Europeans, and they still form the bulk of the inland population, but the villages of the coast are occupied by a mixed race, in which the Papuan element, however, prevails. The islands of

Goram, Ceram-Laut, Bo, Poppo, Geby, Patani Hoek, and the south-eastern extremity of Gillolo, are also occupied by people of the mixed race, who are remarkable for their maritime activity, and for their friendly disposition towards European strangers. The woolly-haired tribes are more numerous in the Philippines than in any other group of the Indian Archipelago, with the exception of New Guinea. M. Mallet, as already stated, gives the amount of the "Negrito" population in 1842 as 25,000. This can only be considered as approximative, still it is probably not far from the true amount. The race, therefore can scarcely be less numerous now than on the first arrival of the Spaniards more than three centuries ago. Indeed, their distribution among the Islands of the group seems to have been much the same then as at the present day; for the island on which they were first seen was named by Magellan "Isla dos Negros," to distinguish it from the adjacent island Zebu, where his ships remained for some months. Negros still contains a large population of Papuans, while Zebu is altogether free from them, and no record exists of their having ever been found there. Samar and Leyte are similarly situated with Zebu, but Mindanao and Mindoro contain several tribes of Negritos, and they form the chief population of the less accessible parts in the mountain ranges of Luzon, the largest island of the Philippine group. The accounts of the Negritos given by the early Spanish navigators perfectly apply to their present condition. They are described as being smaller, more slightly built, and less dark in colour than the negroes of Africa, and as having features less marked with the negro characteristics, but as having woolly hair.

From a number of inquiries among Papuans who were marked with the raised cicatrices, it appears that those on the arm and breast, which are the largest and most prominent, are made in order to qualify them for admission to the privileges of manhood, by showing their capability of bearing pain.

The Malayan term for crisped or woolly hair is "rambut pua-pua." Hence the term "pua-pua," or "pupua" (crisped), has come to be applied to the entire race; and expresses their most striking peculiarity. The features of the Papuans have a decided negro character: broad noses, thick and prominent lips, receding foreheads and chins, and that turbid colour of what should be the white of the eye, which is apt to give the countenance a sinister expression. Their natural complexion is almost universally a chocolate colour, sometimes closely approaching to black, but certainly some shades lighter than the deep black

which is often met with among the negro tribes of Africa. The Papuans, when placed in circumstances favourable for the development of their powers, are physically superior to the races of south-eastern Asia. Some of the New Guinea tribes would bear a comparison, in point of stature and proportions, with the races of Europe, were it not for a deficiency about the lower extremities. Even the more diminutive mountain tribes are remarkable for energy and agility—qualities which have led to their being in great demand as slaves among their more civilized neighbours. With regard to mental capacity, also, they are certainly not inferior to the brown races; but their impatience of control while in an independent state, utterly precludes that organization which would enable them to stand their ground against encroachment; and they invariably fall under the influence of the Malaysians whenever the two races are brought into contact. The islands in which remnants of Papuan tribes may yet be found are Sumba or Sandal-wood Island, Buru, the Xulla Islands, and the small eastern peninsula of Celebes, which terminates at Cape Taliabo. Sumba is a mountainous island, three hundred miles in circumference, lying to the south of Flores, from the coast of which it is distinctly visible in clear weather. The inhabitants of Savu possess a settlement near the south-west extreme of the island, and the Bughis traders of Ende have two or three small stations on the north coast which are occasionally visited by small European vessels for the purpose of obtaining horses; but the natives of Sumba all dwell in the uplands, where they cultivate maize, yams and other produce similar to that grown on Timor, and are said to use the plough, which is unknown in any other island to the eastward of Sumbawa.

The existence of a Negro race in the Indian Archipelago, so remote from the continent which is considered as the original seat of the race; their position in many of the larger islands, as occupants solely of the mountain fastnesses, surrounded by people who evidently belong to a distinct race, show that they are the prior occupants of the islands in which they are still found. The position of the Negro country with regard to the Aurea chersonesus agrees well with that of New Guinea, the great seat of the Papuan race. The most striking peculiarity of the Oriental negroes consists in their frizzled or woolly hair. This, however, does not spread over the surface of the head as is usual with the negroes of western Africa, but grows in small tufts, the hairs which form each tuft keeping separate from the rest, and twisting round each other, until, if allowed to grow, they form a spiral ringlet. Many of the tribes, especially those who occupy the interior parts

of islands whose coasts are occupied by more civilized races from whom cutting instruments can be obtained, keep the hair closely cropped. The tufts then assume the form of little knobs, about the size of a large pea, giving the head a very singular appearance, which has, not inaptly, been compared with that of an old worn-out shoe-brush. Others again, more especially the natives of the south of New Guinea, and the islands of Torres Strait, troubled with such an obstinate description of hair, yet admiring the ringlets as a head dress, cut them off and twist them into skull caps made of matting, thus forming very compact wigs. But it is among the natives of the north coast of New Guinea, and some of the adjacent island, of the Pacific, that the hair receives the greatest attention. These open out the ringlets by means of a bamboo comb, shaped like an eel-spear, with numerous prongs spreading out laterally, which operation produces an enormous bushy head of hair which has procured them the name of "Mop-headed Papuans." Among the natives of the Fiji islands, (the eastern-most limit of the Oriental negro race) the operation of dressing the hair occupies the greater part of a day. The hair of the beard and whiskers, which generally grows very thick and bushy, is arranged in little tufts similar to those of the head, and the same peculiarity is found to exist in the hair with which the breasts and shoulders of the men are often covered, but the tufts are here farther apart than on the head and chin. This woolly or twisted hair is peculiar to the full blooded Papuans. A comparatively slight mixture with the brown-complexioned or Malayu-Polynesian race appears to destroy the peculiarity. The hair of people of the mixed race covers the surface of the head, or at least has done so in all cases that have come under my observation, and is sometimes only slightly curled. It is therefore very easy to distinguish the pure Papuans, and throughout this essay those only will be called by that name who possess this their leading characteristic. The term Papuan is derived from a Malayan word "pupua or pua-pua," crisp-haired. The term "tanna pupua" or "land of the crisp-haired" is applied by them not only to New Guinea, but to all the adjacent islands which are occupied exclusively by this race. It is so peculiarly applicable, and comprehensive, and so entitled to respect as having been conferred by a people who must have known them for ages before we even heard of their existence, that I trust the ethnologists of Europe will excuse me for retaining it in preference to the newly invented term. "Melanesian" or "inhabitants of the black islands," which, although applicable enough to the Papuans, is equally applicable to the greater portion of the Australian tribes.

The features of the Papuans have a decidedly negro character, broad, flat noses, thick lips, receding foreheads and chins, and that turbid colour of what should be the white of the eye which gives to the countenance a peculiar sinister expression. Their complexion is universally a deep chocolate colour, sometimes closely approaching to black, but certainly a few shades lighter than the deep black that is often met with among the negro tribes of Africa. With regard to stature, a great difference is found to exist between various tribes, even in New Guinea, and which has led to much confusion in the descriptions given by travellers, who have, perhaps, each only seen a single tribe. On the south-west coast of New Guinea, within a space of one hundred miles, are to be found tribes whose stature is almost gigantic, and others whose proportions are so diminutive as almost to entitle them to the appellation of pigmies, while the manners and customs to each so exactly correspond as to preclude the supposition that these peculiarities can be other than accidental. It is difficult to account for these peculiarities, but as the stout and stalwart Papuans are met with only among those coast tribes who have maintained their independence, and at the same time have acquired many of the agricultural and mechanical arts from their neighbours the Malayu-Polynesians while the pigmies are found only in spots where they have been driven to mountain fastnesses, or have fallen under the influence of other races, we may conclude that their mode of life has much to do with this difference in point of stature and proportions.

With regard to form, the various tribes of Papuans differ as much as in stature. The more diminutive tribes, whose members chiefly come under the notice of Europeans from their existing in great numbers as slaves throughout the Moluccas, are unprepossessing enough in when in their natural state, but when under good masters, the regularity and wholesome nature of their diet, coupled with the apparent utter forgetfulness of their native land, produce a roundness in their neat clean limbs, and a sprightliness of action which is rarely met with among their more civilized neighbours the Malayu-Polynesians. On the other hand, the larger Papuans are more remarkable for their strength than their symmetry. They have broad shoulders and deep chests, but a deficiency is generally found about the lower extremities, the splay feet and curved shins of the western Africans, being equally, or even more common among, whom I may be allowed to term, the gigantic Papuans.

The celebrated philologist, Marsden, has adopted the term "Negrito" or "little Negro" from the Spaniards of the Philippines, and has applied it to the entire race.

The highest state of the sea-faring art among the Papuans, without foreign assistance, is met with in Torres Strait and upon the south coast of New Guinea. Here they possess large canoes of such construction and propelled in so peculiar manner, that we must consider them purely Papuan. Some very excellent sketches of these canoes are given in Flinder's voyage with so full a description that it will be unnecessary for me to enter into minute particulars. These canoes or boats are from thirty or forty feet long, and the planks with which they are constructed are sewed together with the fibres of the cocoanut. Each is provided with an outrigger, and a platform of bamboo occupies the centre of the boat on a level with the gunwale. They are propelled in calm weather by paddles with long handles, the rowers all standing, as is generally the case among the Papuans. But the most striking peculiarity of these vessels consists in the sail, which is an oblong piece of matting set up in the forepart of vessel by means of two poles or masts, to which the upper corners of the sail are fastened. These masts are moveable, and the sail is trimmed by shifting the head of one of the masts ast. According to my experience these boats sail very indifferently, except before the wind, but Captain Flinders, who had good opportunities of judging, maintains a more favorable opinion. They are often to be met with about the month of March three or four hundred miles down the north-east coast of Australia, the islanders being in the habit of making an annual voyage in this direction. The stopping places are usually the islands lying off the coast, where they obtain tortoise-shell and trepang, the chief objects of their voyages.

The natives of the south coast of New Guinea have very large canoes of a similar but more unweildy construction, and propelled by a similar description of sail. These have never been seen far from the coast, and in fact are almost unmanageable from the difficulty experienced in steering such unweildy masses with paddles alone. It is therefore difficult to conceive for what purpose they have been constructed, unless it should be for war, in which case their large size would give them an imposing appearance.

The New Guinea canoes generally are of light construction and are provided with an outrigger. The larger ones have an attap roof and are capable of containing an entire family, with household furniture and domestic animals.

While most of the oceanic spiral haired tribes are distinguished, by their general physical character, from the adjacent races of E. Asia, they have most decided resemblances to the E. African races. In every

considerable group of African tribes several varieties may be observed. This remark, which is true of the continent, applies also to Madagascar. In the Asianesian groups a large range of variations is also seen. This is exhibited in the Philippines, as well as in the more eastern groups. In Africa there are exceptions of a peculiar kind to the distinguishing character of the hair. In some of the Fulah tribes it passes from slightly curled to straight, and becomes soft and silky. If the Australians be admitted to have an affinity to the Asianesian family of negroes, the same exception appears in it also. Most of the other African varieties have also their representatives in Asianesia. Thus Prichard gives a portrait of a Mozambique negro which is a very correct representation of one variety of the eastern negro found in the island of Ende or Flores. A remarkably indented appearance or sinking in at the junction of the nose and forehead is observable in some of the negro tribes of Africa, in those of S. India and in Papuan tribes. It is also probable that the form of the nose and forehead observable in many of the Papuas, is also a characteristic of some of the S. Indian and E. African people. Some of the African tribes have a Semitic cast of countenance, and there are varieties of the south Indian and Papuan families which present the same aspect. But the grand resemblance is that which appears in the more generally prevailing characteristics of both families,—such as the spiral hair; oval and sometimes elongated form of the face; the moderate thickness of the lips which in some varieties even become thin; the general absence of the prognathous form, which is so marked a peculiarity of some of the African and Asianesian negroes, and of the obliquity of the ocular opening and smallness of the eye which distinguish many of the E. Asian races; the nose, full and somewhat flat, but sometimes slightly aquiline, and, in general standing out from the face much more than in the S. E. Asian races; the anterior projection of the cheek bones, and, on the whole a general cast of countenance decidedly retiring from that of the Guinea negro on the one side, and the Mongol on the other, and which would perhaps be best described physiologically as Indo-African. It is intermediate between the S. Indian and the negro type, and if the spiral hair were generally absent, as it is in some tribes, it would approach the former much more nearly than the latter. The Indian character of many of the E. African races and some of the middle and westerly ones, such as the Fulah, Ashantee, Mandingo, and Yarriba, has been frequently remarked, and the same character is seen in many of the varieties of the Papuas of New Guinea and Torres Strait. Even

the ample Indo-Semitic beard, never found in the S. E. Asiatics, appears amongst the Australian, the negroes of Tanna, Mallicolla, Rotuma, and less noticeably, amongst some of the western Papuas. Several of the Madagascar tribes have the spiral hair and other characteristics of this physical type, and the decided resemblance between them and varieties of Papuas found from New Guinea to New Ireland, has been strongly insisted on by Lesson, who examined both. There are probably few varieties of the east African types, from those of the Danakil on the Red sea to those of the Kafir and Kongo tribes in the south, to which near approximations might not be found in the eastern islands. On the other hand, it must be remembered that amongst the Papua tribes there are varieties leaning to the S. E. Asian type, while preserving some decided African characteristics. The great difference between the generally direct, and often rapid and demonstrative, Indo-African temperament of the Papuas, and the slow, reticent, phlegmatic Tibeto-Siamese temperament of the latter Indonesian, is strongly marked in the expression of the face in most of the Papuanesians, and indeed is often even more striking than the difference in features. Even the more lively eastern continental tribes, such as the Anamese, with the Gallic demonstrativeness and the abrupt and independent air of the Papuas, in this respect rather resemble the Tibeto-Indian, Polynesian and Micronesian. The different Papua modes of dressing the spiral hair are all practised in Africa, where some tribes make it stand out like a distaff, supporting it with wooden pins, while others plait it into slender ringlets. The dressing and arranging of these plaited locks is a laborious and important operation amongst the Malagasi and many African nations, as amongst the Fijians and other Asianesian tribes who have the same custom. With some the hair is shaven, save a knot at the top, and some make it into wigs. The Sumali and other tribes stain the hair or decolorize it with lime. Many tribes smear the body with grease, and daub or streak it with red ochre and pigments of other colours. All these are Melanesian customs. The teeth are filed into a conical form, while others notch them, and it deserves remark that of the two modes of filing the teeth prevailing in Asianesia, the horizontal and the serrated, the latter or African is the one practised by the Papuas. The former or Burmah-Tonkin custom, which is generally adopted by the Tibeto-Anam tribes of Asianesia, appears, however, to have prevailed in ancient Egypt and the Canary islands, as it does still in some American and Esquimaux tribes. An equally curious fashion, that of boring the septum of the nose and wearing a piece of wood, bone, &c., in it, is

African, Papuan and Australian. Circumcision prevails amongst some of the African tribes. Some African, like some Australian tribes, knock out two of the front teeth. The African practice of making long gashes in the skin, and raising the flesh in cicatrices, is Australian and Papuan also. Tattooing and the custom of each tribe having a different pattern, or a distinguishing mark, prevail in both regions. Large perforations of the ear are African as well as old Indian, Trans-Indian and Asianesian. Among other customs found in Africa and in some of the eastern islands, are many of those connected with the most ancient shaman and fetish religions, and with a rude form of Sabæism, a belief in sorcery, metempsychosis, putting sorcerers to death when they will not give rain, the pretended extraction of diseases from the body of the patient, in the shape of animals, bits of bone, wood, &c., animal worship, the selection of tutelar or sacred animals by different tribes, the peculiar sanctity of the crocodile, the annual sacrifice of a youth or virgin to it, purging villages of evil spirits, the custom of human sacrifices generally, different forms of cannibalism, eating portions of slain enemies and of deceased relatives, preserving the heads of enemies; drinking warm blood and eating raw flesh, tearing the heart or kidneys out of animals and devouring them, omnivorous and uncleanly habits; infanticide, the destroying of old and diseased persons; many incidents of the system of interdictions or tabu, tabu of the domestic fowl, food forbidden to particular classes, uncleanness, purifications, removal of prohibitions, the character of the dances in Australia, Van Diemen's Land, &c., and amongst many of the African tribes, lunar dances; abandonment of the house and sometimes the village in which a death has taken place, doubling up the body with the head resting on the knees and burying them in circular graves or in jars, smoking corpses to preserve them, keeping them in caves, keeping the bones of the dead in the house and carrying them about for a time, the preservation of the skulls of ancestors, slaughtering horned animals and placing the horns on poles or trees around the grave; ordeals, oaths and engagements by drinking blood; conical and hemispherical huts; boomerangs, poisoned arrows, the shape of shields, spears, &c., earthen-ware manufacture, the peculiar style and ornament of carved wooden articles, clubs, spoons, images, or fetishes of animals, gods, &c., the style of plaiting caps, baskets, &c., procuring fire by working a piece of stick in a cavity made in another piece, tubular bellows worked by a piston, the resemblance between the peculiar cylindrical beads worn by the ancient Guanches of the Canaries, and those

worn by the Timoreans; many social usages, such as those connected with the sexes, ceremonies attending circumcision or the initiation of youths to test their courage, &c., and promote great endurance of bodily pain, peculiar secret societies, &c., &c. This distinguishes all the races of the Oceanic basin which have not been purified by the Brahmanic and Semitic religions. In the customs of destroying the aged, compare the voluntary Fiji practice with that of the Tachuktshi in N. E. Asia. Some tribes place their dead in stone and earthenware jars (Celebes, New Guinea, Japan) and others, who have no jars, in circular graves, (Australia), strong traces of this and numerous other Africo-Asianesian customs are found in S. India. The translations of the Mackenzie MSS. by the Rev. W. Taylor, which have appeared in the Madras Journal of Literature and Science, contain many notices illustrative of the ethnology of this region and amongst them are the following: "Anciently men wearing tufted hair, Curumbars and various others, of the Jaina credence, dwelt in this town. They were the aboriginal residents." "Anciently in this town, they did not keep the very old people (in the houses) until death; but seeing the time approach, they put them in very strong-made earthen jars, together with food suitable for them. Such was the practice in this Padnur. They would die off, some little time after being placed there. Such kind of earthen jars are termed *matamaccchal*, which may be rendered 'heretic dog kennel,' *matama* may also be for *mantama* or *martaban* jar. Though these were placed in early days, yet even now many such *chial* (pans or buckets) are to be seen. Human bones, and drinking vessels which had been placed therein, have been taken out, and buried." In Banabe (Micronesia) noble women marry common men and their children rise to the chieftom which the sons of chiefs never do: this has a resemblance to the Nair custom.

The two principal forms of the S. E. Asian head, the angular (square, lozenge or oblong) and the ovoid, both well distinguished from the Africo-Indian shape of the pure Papuan, the different shades of brown, yellowish, and brownish-yellow, which prevail to the westward of China, and the coarse lanky hair which characterises the E. Asian races, are all repeated in the purer Malayu-Polynesian tribes. The remarkable ovoid forms characteristic of the Anamce and many of the insular tribes, and the more delicate varieties approaching to oval are indetical with those so often found amongst the Indo-Tibetan tribes. The quasi Iranian character of some of the Asianesian races appears to connect itself with a western influence exerted on the ethnology of the Gangetic basin

before the era of the Iranian movement to the eastward. The harshly angular or predominating form of the Mongolian head is not the most prevalent Indonesian. It is chiefly found amongst the western Malays. To the S. E. the finer ovoid verging often on the oval, predominates. The ceremonies attending the consecration of a spot in the house to the spirit of a deceased relative, inviting him to come and occupy it, searching for the fancied traces of his passage in the ashes that are sprinkled on purpose, are the same in India amongst the Kol and in Indonesia amongst some of the Philippine and Timorean tribes. The same custom slightly modified prevails in Amboyna, Bali, Mangkasar, &c. The marriage ceremonies have a frequent identity, as with the Himalayan Limbu and the Bornean Kahayan, &c. The curious division of the price paid for a wife, and the various ceremonies attending its payment, have a remarkable resemblance amongst the Kol and probably many other tribes in India, and the Batta, Luzonian and other lank-haired races of Indonesia. No sooner has the impatient bridegroom paid one of the customary exactions, than he is met by another. The agreement in social and political institutions is great. Amongst the former are the custom of bachelors, and the less widely spread one of the girls, occupying a separate common house; the prohibition of marriage between persons of the same clan, a very archaic institution, for it prevails in America, N. E. Asia, China, in India amongst the Khonds, &c., (and originally amongst the Arya), in Australia, and amongst the greater number of the Tibeto-Anam tribes of Asia; the holding of all land and other inherited property by the female children, and the reception of the husband into the wife's clan (Kocch, some of the Garo tribes, Malays of Menangkabau, &c. ;) many customs connected with marriage, the position of the wife, divorces, their consequence, and the congregation of a whole village in one long house.

There is the same hunting for a great number of heads amongst the wilder tribes of Celebes as there is with the Kuki on deaths, particularly of chiefs. This has also extended to N. W. and S. Australia. The Sabaism of Indonesia and Australia is a curious reflection of that which prevailed in S. W. Asia. The moon is the wife of the sun. The Timorean race, like the Naga, heap irony and insult on the head, place food before it, ask it if it is pleased with its place of rest, "if so, call your relations and let them eat, or will you eat alone? eat then, &c." The Timorian group preserves the most interesting combination of African and Indian characteristics which Indonesia affords. It would alone prove the two connections in the

most decisive manner. The languages have many Tibeto-Indian as well as African features. The Turanian physical characteristics prevail amongst the Rajmahali, Khond, Kol and Gond on the southern side of the Gangetic basin, as far as the meeting of the Gond and the Bhil where an Africo-Indian character takes its place. On the northern and western side it prevails throughout a great portion of the Himalayan basins of the Ganges and Brahmaputra, in Assam, and in the western projection of the Trans-Indian highlands which enters into the southern and eastern part of the Brahmaputra basin. The Tibetan races are spread along the whole of the great Trans-Himalayan depression or from the Hindoo Koh to the borders of China. They meet and partially blend, physiologically, linguistically or morally, with Indian races along the entire length of the Himalaya. In the western extremity the latter prevail and the physiological boundary gradually but irregularly descends from the highest ranges, till it embraces the upper habitable portions of the Sutlej, Jumna and Ganges Alpine basins in Bisahar and Gharwal, after which it ascends again where the Tibetan depression is most elevated and contracted and thinly peopled, there being apparently no Tibetan mixture in Kumaon. The large Turanianism observable in Assam and the northern and eastern sides of the plain of Bengal, the considerable contrast which even the proper Bengali peasantry afford both physically and morally to the Hindustani, the fact of Turanian tribes being preserved on the opposite sides of the common valley of the Ganges and Brahmaputra in the Rajmahal and Garo mountains, as well as all along its northern and eastern margin, and as far as the upper basin of the Tapti to the S. W. warrant the conclusion that similar tribes once occupied all the lower part of the Gangetic basin. The northern Indo-African tribes appear to have occupied the western part of the Gangetic basin,—the opposite sides of which still preserve remnants of them in the Chamang, Dom and Rawat on the N. and the Bhil and other allied tribes on the S. a large portion of those of the Nerbudda and Tapti, and probably the upper branches of the Godavery and Kishna, as well as all the western seaboard from the Gungawally northward. Their N. W. boundary must have been gradually driven in by the advance of the Aryan tribes. Before the rise of the Iranian tribes, tribes intermediate between Iranian and Turanian, probably occupied the basin of the Indus and even extended N. and W. so as to connect themselves on the one side with the ancient Africo-Semitic and on the other with the Mid-Asian. The southern Indo-African tribes were a continuation of those of the N. W.

and the Tamil and other populous ones appear to have owed to their large river basins and to the influences received from Egypt and S. W. Asia, the civilization which enabled them so greatly to surpass their northern neighbours. As far as can be gathered from the present distribution of the tribes, the whole of India would thus appear to have been physiologically divided by an irregular line running from the Alpine basin of the Kali to the upper basin of the Tapti and thence S. E. along the Warda and Godavery nearly to the mouth of the river. To the E. of that line Turanian and Irano-Turanian features prevailed and to the W. Africo-Indian, the latter being much more Iranian than the former and probably presenting a negro character in its ruder and servile people, and Iranian and quasi Iranian in the higher of its more civilized tribes. The boundary has doubtless been much affected by internal movements and contests in all the middle Indian highlands, induced by the external pressure of the Aryan nations, and even in the pre-Aryan era it must have undergone a succession of changes. During that period strong Africo-Indian influences appear to have extended over the S. portion of the eastern or Turanian region, and produced languages intermediate between the Tamulian and Tibeto-Indian which was the more easily effected from the two having numerous characteristics in common. The Tibeto-Tamulian era must therefore have been of great length.

The Papuan race extends from New Guinea eastward through the Louisiade and Solomon Archipelagos to the new Hebrides, (where it co-exists with some tribes of Malayu-Polynesians) and still further to the Fiji islands which, however, is the extreme limit of the race in an eastern direction. It is singular that the Papuan race improves as it recedes from the continent of Asia and advances into the Pacific. The Fijians are the aristocracy of their race. They are Papuans only in their physical characteristics, their civilization is as advanced as that of their neighbours of the Friendly Islands. The equal position they maintain with regard to the latter who prefer them rather as friends than as enemies, prove that the physical capabilities of the Papuans are not inferior to those of the Malayu-Polynesians, and also that the crushing influence the latter have gained over the former within the limits of the Indian Archipelago, is more to be attributed to their possession of more formidable weapons, such as swords and muskets, and to their discipline although imperfect enough, than to any natural superiority. New Caledonia is occupied by a race in which it is difficult to say whether the Papuan or Polynesian element is predominant, several travellers have also thought that they could discover traces of a

negro race in New Zealand, which might possibly be the case, for the Papuans of the Fiji islands have been long accustomed to navigation from island to island and they might have been carried there by a similar chain of events to that which brought the Malayu-Polynesians. In a south direction the Papuans have evidently spread far and wide over the continent of Australia, for although the influx of another people has greatly modified the Papuan character of the race, it exists or did exist in its purest character in the island of Van Diemen's Land. The inextinguishable hatred which they bore towards the European settlers, rendered their presence so hateful, that the latter rose en masse to exterminate them, but these children of nature, owing to their superiority in bush tactics, escaped through the cordon that had been drawn around them during the night. Diplomacy effected what force was found unequal to, and the remnant of the tribe was persuaded to surrender and was deported to an island in Bass Strait. It seems that a man and two boys were left behind, for about three years subsequently, two shepherds, unarmed, and dreading no danger, were attacked and wounded by three half-starved wretches, a man and two boys who had not strength to effect their purpose, and who were soon added to the community of Flinders island. They had remained concealed in the thick brushes near Circular Head until an opportunity occurred, as they thought, of gratifying their hatred, against the intruders. Marion, was the second European visitor to Van Diemen's Land, Abel Tasman being the first. He describes the Van Diemen's Land natives as of the common stature, of a black colour, and all naked, both men and women, and some of the latter had children fastened to their backs with ropes made of rushes. All the men were armed with pointed sticks (spears) and with stones sharpened in the manner of axe heads. They had, in general, small eyes, and the white duller, than in Europeans, the mouth very wide, the teeth white, and flat noses. The hair, which resembled the wool of caffres, was separated into shreds, and powdered with red ochre. They were generally slender, tolerably well made, kept their shoulders back, and upon their prominent chests, several had marks raised in the skin. Their language appeared harsh, the words seeming to be drawn from the bottom of the throat. The Papuan character of the hair, in which they differ from the Australians, is distinctly noticed by several writers, more especially by Captain Bligh and by Captain Cook's intelligent surgeon and naturalist Mr. Anderson. The latter not inaptly compares it with the tuft-like hair of the Hottentots of South Africa, to which indeed it bears a perfect resemblance. Some

other travellers have evidently supposed this singularity to have been the result of some artificial process, not being aware that any race on earth possessed hair of so peculiar a nature.

After a long experience of the Australian continent which included prolonged residence on the north, south, east, and west coasts, during which Mr. Earl's attention had been particularly directed to the native races, he had never been able to detect a single tribe of pure Papuans, and the only traveller who has described a people who might be supposed to be such, is the celebrated Dampier, who speaks of meeting a people with woolly hair on the north-west coast. The tribe which now inhabits that particular spot resembles the people encountered by Dampier in everything but this. It seems improbable that so great a change should have occurred in so comparatively short a period, but it is certainly not impossible. Melville Island, which is separated from the north coast of Australia by a strait only a few miles wide is inhabited by a people of pure or nearly pure Papuan origin, who are looked upon as foreigners by the natives of the opposite coast of Australia, with whom they have little communication, and that little invariably hostile. In a north-west direction from New Guinea, the Papuan race extends through the Moluccas, to the Philippines, but in these islands they only appear in small and scattered tribes occupants of the mountain fastnesses. The small islands which extend from New Guinea to Timor, with the exception of the Arru Islands are occupied by Malaya-Polynesians of the most decided character, but at Timor, especially near the north-east end, a race evidently of Papuan origin again appears, but never, as far as Mr. Earl had been able to ascertain after strict enquiry, in an absolutely pure state. These tribes are much oppressed by the Malaya-Polynesians who occupy the table-land of the interior; and the slaves which are brought down to the settlements on the coast, and were formerly exported to Macao and other places, were chiefly of this race, which led to very erroneous impressions with regard to the nature of the inhabitants of Timor on the part of those who have only met them at Macao, where the negro character naturally prevails among them. Some tribes on the great island of Flores or Mang'arai assume a more decided Papuan character, and there is said to be also a tribe of these people in the neighbourhood of the Timboro mountain on Sambawa; but beyond this they disappear, and are not encountered again until we meet them on the Malayan peninsula under the name of Semang, occupying some mountain tracts in the states of Kidah, Perah, and Kalantan. The Andaman Islands in the Bay of Bengal are

occupied by a people of most decided Papuan character, who bear, indeed, a very striking resemblance to the natives of Van Diemen's Land. Hence they can be traced no further, unless the analogy recently discovered by Mr. Norris, the Assistant Secretary of the Royal Asiatic Society, between the Tamil language of the Coromandel coast and some of the Australian dialects, may lead to the establishment of an affinity between the nations that use them.

As the Papuans have no records, and no traditions but those of a most vague description, the mystery which hangs over their origin can only be dissipated by analogy drawn from the circumstances in which we find them placed. Of one thing there can be no doubt, namely, that all the Negro tribes to the eastward of the continent of Asia, belong to one and the same race. This is proved by the almost perfect identity that exists between all those tribes however remote from each other, which have not had opportunities of deriving improvements from more civilized neighbours; and where this has occurred, in New Guinea and the adjacent islands of the Pacific for example, their personal characteristics are still maintained in the utmost purity. With the solitary exception of the Fiji islands, every spot on which the race is now known to exist, can be reached from the continent of Asia by passing from island to island without being under the necessity of going out of sight of land. An inspection of a chart on a large scale of the Indian Archipelago and the Pacific, will render this point sufficiently palpable to the reader. This would go to prove two things; first, that if they migrated from any continent it must have been from that of Asia; and secondly, that they must have been unprovided with vessels fit to encounter voyages of even a few days' duration, in fact they would appear to have been in precisely the same condition as the natives of Van Diemen's Land, Melville Island and the south-west part of New Guinea, of the present day, deriving their chief subsistence from the shores of the sea, where those who subsist solely on the productions of nature can provide themselves better than in the dense forests of the interior. The Papuans everywhere delight in dwelling on the coast, although not a decidedly maritime people; while the superior tribes of Malaya-Polynesians, delight in occupying the table-lands of the interior, where their knowledge of agriculture enables them to obtain an abundant subsistence. The propensity to migrate is as great in persons living on the sea shores without fixed habitations as in wandering pastoral tribes, especially if, as was probably the case in this instance, they were urged by a pressure from behind, caused by the advance of a superior race on

the continent of Asia. This propensity may be witnessed in full force at the present day on the northern coasts of Australia, where the natives take great delight in wandering in families along the margins of the sea, spearing the fish, and often the turtle, as they go, and generally accomplishing eight or ten miles a day. When they wish to visit one of the islands lying off the coast, or to cross a wide river or an arm of the sea, half an hour suffices to strip the bark of the curved stem of a tree in one single sheet, and, by tying up the two ends and spreading the centre out with sticks, to convert it into a boat sufficiently commodious to transport the family across the piece of the water; or, where this material is not to be procured, a raft of the stems of the pandanus palm is made to answer the same purpose. What people could be more adapted for migration than one that cared not for more shelter than the sky afforded, carried all their domestic goods on their backs without inconvenience, and were always tempted onwards by the superior abundance of the productions of nature which untrodden shores afforded? What a paradise must Australia have appeared to such a people, with its sandy bogs teeming with fish, and its open interior abounding in herds of Kangaroos as yet unaware of the danger which the presence of man placed them in.

The Dutch corvette Triton, in the course of her examination of the S. W. coast of New Guinea, in search of a spot on which to found a settlement, entered an inlet near Cape Valsche which has since proved to be a strait. A party of natives was seen upon the beach, apparently inviting an interview, and an armed boat, containing several officers, among whom was Lieutenant Modera, was sent on shore to communicate with them. "When the boat had reached to within a musket shot's distance from them, the natives, who were armed with bows, arrows and lances, commenced making a number of singular gestures with their arms and legs. The Ceramese interpreter called out to them in a language composed partly of Ceramese and partly of a dialect spoken by a tribe which dwelt more to the north, but which was evidently quite unintelligible to them, for they answered only by loud and wild yells. We endeavoured for a long time without success, to induce them to lay aside their weapons, but at length one of them was prevailed on to do so, and the others followed his example, on which we also laid down our arms, keeping them, however, at hand. We now closely approached each other, and the interpreter, dipping his hand into the water sprinkled some over the crown of his head as a sign of peace. This they seemed to understand, for two of them immediately did the

same, on which the interpreter jumped into the shallow water, and approached them with some looking glasses and strings of beads, which were received with loud laughter and yells. They now began dancing in the water, making the interpreter join, and the party was soon increased by other natives from the woods, who were attracted by the presents. One of the officers also jumped into the water and joined in the dance, and they soon became so friendly as to come close around the boat. This state of affairs, however, did not last long. The natives were detected secretly dragging the boat to the beach, and on being prevented from doing so, they shot a flight of arrows into the boat, and wounded two of the crew, who retaliated by a discharge of musketry which killed or wounded three of the natives. Those who are acquainted with the character of the Papuans will see in this the usual results of first interviews with the more uncivilized tribes, but they will scarcely be prepared for what follows. "In the afternoon of the same day at the time of high water, three of the naturalists went in a boat well armed to the same spot, where they found the trees full of natives of both sexes, who sprang from branch to branch, with their weapons on their backs, like monkeys, making the same gestures, and screaming and laughing as in the morning, and no offers of presents could induce them to come down from the trees to renew the intercourse. This singular scene was also witnessed by those on board by means of their telescope." Such ape-like agility on the part of any members of the human family would be scarcely credible, had we not so many proofs of how readily man adapts himself to the circumstances in which he is placed. The immense mangrove jungles which line this part of the coast could scarcely be traversed except by climbing from branch to branch. A similar facility in ascending trees, and moving among their branches, is found among the natives of Melville island on the north coast of Australia, who bear a striking resemblance in many particulars to this New Guinea tribe. During the period in which this island was occupied by a British garrison, many of the men were killed or wounded by spears thrown from the trees, where the natives appeared to use their weapons with as great facility as on terra firma. The New Guinea tribe above mentioned seems to possess all the general characteristics of the Papuans. "Their stature is of the middle size and they are by no means strongly built. Their skin is black, but not very deep in colour, and with a bluish tinge. The lips are pretty thick and the nose somewhat flat. The hair of the head is frizzled, like that of the African negroes and pitch black in colour. The beard and

whiskers are allowed to grow, the first is crisp (*kort-gekruld*) like that of the head." (*Modera*, pp. 25-30.) The natives of the Utanata river, about 100 miles to the northward of the tribe just alluded to, are the finest looking men of all the people of the west coast of New Guinea. The river whose banks they occupy, is the southernmost limit of the adventurous voyages of the traders from Celebes. These men are above the middle size, and many among them may be called large men. They are stout and well made. Their colour is a dark brown, with sometimes a bluish tinge. They have dark and small eyes, a flabby, drooping nose, the septum of which is usually bored and an ornament of wood, or hog's tusk worn therein. The mouth is large and provided with very white teeth, which are sometimes filed to points. The lips are tolerably thick. Their features bear considerable resemblance to those of the Africans, a character which they possess in common with the tribe previously described, but the expression is by no means so hard and repulsive as is the case with the latter. Some of them have marks on the body, especially on the arms, breast and belly, made by cutting the flesh with sharp stones and then burning the wound, which causes the flesh, when the cicatrix is formed, to stand out in relief in weals the thickness of the finger.

Andamans. Very full accounts of the people of the Andamans are given in one of the earlier volumes of the "Asiatic Researches," and also in Colonel Symes' Embassy to Ava. Their limbs are spare and ill-proportioned, their bellies protuberant, the complexion black and the hair woolly. They have also a taste, so characteristic of the wilder Papuans, for daubing their heads with red ochre. They have canoes, but use small rafts when they wish to visit the islets. Both sexes go entirely naked, for the pieces of fringe they wear about them are rather intended for ornament than as a covering. They obtain fish by descending to the shore at low water and spearing those that are left among the reefs by the receding tide; or by catching them with small hand-nets, and depositing them in long wicker baskets which they carry slung from their shoulders. All these are characteristics of the wilder coast Papuans, especially those of Van Diemen's Land, to whom indeed the Andamaners bear a resemblance so striking as to excite surprise that two tribes who must have been separated during many ages, and who reside in climates so different, should be distinguished by precisely the same characteristics. The only point of difference that can be detected, consists in the knowledge on the part of the Andamaners of the use of the bow and arrow, which was either never known to the Van Diemen's Land natives

or has been neglected in favour of the dart or throwing spear, which is far better adapted to the open nature of their country.

Pacific. The best and fullest account of the Fijians is found in Lieutenant Wilkes' narrative of the United States Exploring Expedition. An immense deal of valuable matter concerning the inhabitants of Van Diemen's Land, the new Hebrides, new Caledonia, in fact of all the islands of the Pacific with the exception of the Fijia and Samoas, is contained in Cook's voyages which is quite a text book for the ethnologist in Polynesia. Details respecting the north coast of New Guinea, are contained in Duperry and D'Urville's French voyages; and Captain Blackwood of H. M. surveying ship "Fly," gives the fullest account of the natives of Torres Strait and of the south part of New Guinea. A recent work by a French gentleman, M. Mallet, gives many details respecting the negritos of the Philippines, the Papuans of Flores or Sumbawa, have been noticed by Mr. Russell Wallace. The Semang of the Malay Peninsula have been shortly described by Raffles, Crawford and Marsden, and their accounts have been sufficient to decide, at all events, their negro character.

MacGillivray says he found it difficult to state the peculiarities of one of the Papuan races, (including the inhabitants of the Louisiade) for even the features exhibit nearly as many differences as exist among a miscellaneous collection of individuals of any European nation. They appeared to him to be resolvable into several indistinct types, with intermediate gradations; thus occasionally we met with strongly marked negro characteristics, but still more frequently with the Jewish cast of features, while every now and then a face presented itself which struck him as being perfectly Malayan. In general the head is narrow in front, and wide and very high behind, the face broad from the great projection and height of the cheek bones and depression at the temples; the chin narrow in front, slightly receding, with prominent angles to the jaw; the nose more or less flattened and widened at the wings, with dilated nostrils, a broad, slightly arched and gradually rounded bridge, pulled down at the tip by the use of the nose-stick; and the mouth rather wide, with thickened lips, and incisors flattened on top as if ground down. Although the hair of the head is almost invariably woolly, and, if not cropped close, or shaved, frizzled out into a mop, instances were met with in which it had no woolly tendency, but was either in short curls, or long and soft without conveying any harsh feeling to the touch. In colour too it varied, although usually black, and when long pale or reddish at the tips; yet some people of both sexes were observed having it still woolly,

but of a bright red colour, artificially produced, as is known to be effected by means of lime water by the inhabitants of the north-west coast of New Guinea. The beard and moustache, when present, which is seldom the case, are always scanty, and there is very little scattered hair upon the body. The colour of the skin varies from a light to a dark copper-colour, the former being the prevailing hue; individuals of a light yellowish-brown hue are often met with, but this colour of the skin is not accompanied by distinctive features. The average stature of these Papuans is only about five feet four inches. Although well made, and far surpassing British sailors in agility, they were inferior in muscular power. Their strength was tested by means of a deep-sea lead weighing twenty-two pounds which none of the natives could hold out at arms length, although most of the sailors who tried it experienced no difficulty in sustaining the weight for a few seconds. Cowries are strung round the legs, arms, and neck. Human jaw-bones are frequently worn as bracelets in the Louisiade.

Ansus island, in the Eastern Archipelago, is inhabited by Papuans. Their houses, built on posts, are placed entirely in the water. At very low water only is the beach partially uncovered. This beach consists of mud, in which mangroves grow luxuriantly and completely obstruct a landing. The gardens, from this cause, are situated on the surrounding islands, principally on an island with a high beach lying opposite to the kampong. The *Ansus* Papuans wear their hair in tufts. Their appearance is good natured, faces regular, eyes beautifully black, the mouth broad with beautiful regular teeth, and the forehead high but narrow. Many have thin lips and finely curved noses, which give them a more European physiognomy. The men are generally handsome and well-formed, stout, without being too thick, strong and muscular; the women very good-looking; and some children with very regular soft faces and long pendant curling hair.

Arru, Arro or Arru Islands, extend from lat. $7^{\circ} 0'$ to lat. $5^{\circ} 52'$ S. and in long. $133^{\circ} 56'$ E., run for upwards of 100 miles N. and S. and between forty and fifty miles in breadth, and lie between the Timor Laut group and the S. W. coast of New Guinea. They are a closely packed group, distant about sixty miles from the south-west coast of New Guinea. On the eastern side of the group are found banks of sand and mud, stretching far out to sea, which are only covered to the depth of a few feet at low tides. Inland are many fresh water swamps with thick impenetrable jungle in other places. Their produce is pearls, mother-of-pearl, tortoise-shell, birds

of paradise and trepang. The timber of the islands is much praised. The *Arru* islanders have much intercourse with strangers. They purchase from the Bugis the Papuan slaves brought from New Guinea, who are then employed in diving for pearls and in the beche de mer fishery. The *Arru* islanders are impoverished by their excessive use of intoxicating liquors, imported from Java and Macassar. In personal appearance the people are between the Malayan and Polynesian Negro. They are not many degrees further advanced in civilization than the natives of the north coast of Australia to whom many of them bear considerable personal resemblance. Some of the *Arru* men profess christianity and some are mahomedans. In stature they surpass the civilized natives of Celebes. The dress of the men is a piece of matting or cloth girded round the loins and drawn tight between the thighs, and a salendan or shawl. No fillet is worn round the head. The hair is woolly and frizzled out like that of the Papuan. The men are of a jealous disposition and easily roused to anger by abuse of their women or ancestors, otherwise they are mild of character. The women wear a mat in front and one behind. When a person of consequence dies, these are stripped off and they rush into the sea where they disport for some time. Christianity was introduced into the *Arru* Islands, many years ago, by the Dutch of Amboyna and nearly all the principal people profess this creed. The *Arru* people ornament their houses with brazen trays, called *dulam* or *talam*, and elephants teeth, which are broken up when the owner dies. Tripang is abundant near the islands, in nearly all the varieties, but is indifferently cured. Neither the Kei or *Arru* islanders ever abscond to avoid paying their debts. The *Arru* islanders bear a strong personal resemblance to the aborigines of Port Essington; indeed, on several occasions in which natives from the neighbourhood of the late settlement visited the islands in European vessels, they were considered by the *Arruans* as belonging to some remote part of their own group. But the *Arruans* also possess so many characteristics in common with the Outanata of the opposite coast of New Guinea, that it would be necessary to include them in a general account of the Papuans. One of their most singular peculiarities consists in the value which they attach to elephants tusks, brass gongs, and huge porcelain dishes. An odd custom, and one that is probably unique in the world, consists in the destruction of a man's goods on his death, instead of a distribution of them among his surviving relations. All the chattels which he has collected during his life, including tusks, gongs and precious China dishes, are broken

in pieces and thrown away : and in the villages may be seen heaps of these fragments of property which custom or some singular superstition has deterred the living from appropriating.

The natives of Arru are Papuans, with black or sooty brown skins, woolly or frizzly hair, thick ridged prominent noses, and rather slender limbs ; most of them wear nothing but a waist cloth. Papuan boys sing cheerily as they walk along or talk aloud to themselves, which is quite a negro peculiarity. They have as food raw sago and vegetables, fish and molluscs, and tobacco, betel and arrack are their luxuries. Their houses are rude sheds. There are some mixed races amongst them. The Papuan talks, laughs, and shouts without intermission. The women have only a mat of plaited strips of palm trees worn tight round the body and reaching from the hips to the knee. Their frizzly hair is tied in a bunch at the back of the head. They delight in combing it or forking it, using a large wooden fork with four diverging prongs, to separate and arrange the long tangled frizzly mass. They and the men wear earrings, necklaces, of silver, brass, and shell. The Arru Papuans told Mr. Wallace that some of their tribes kill the old men and women when they no longer can work, but he saw many old folk. Their hair is usually black and strongly curled. Like the African Somali, they wash it with wood-ashes or lime water, which impart to it a lightish colour and cause it to appear rough, both these peculiarities being considered very tasteful by the Alfoers as well as by the Papuans. The Arruans are taller and more muscular than the Malays and Bughis of Celebes, but are inferior in proportions, if not in stature, to the ordinary run of Europeans. The usual height of the men is from five feet four inches, to five feet eight inches, and there is a great inclination to slimmness about the lower extremities among the taller men, some of whom attain the height of six feet. The Arafura of Vorkay (one of the southern Arru) possess no religion whatever. Of the immortality of the soul they have not the least conception. To all enquiries on this subject they answered, "No Arafura has ever returned to us after death, therefore we know nothing of a future state, and this is the first time we have heard of it. Their idea was *Mati Mati-sudah*, when you are dead there is an end of you. Neither have they any notion of the creation of the world. They only answer, "None of us are aware of this, we have never heard anything about it, and therefore do not know who has done it all." The ports frequented by the foreign trading vessels are all in the north-western part of the group, where the people are evidently of a mixed race, the natural result of strangers from the west having married and settled among them during an intercourse

which appears to have extended over several centuries.

The *Baja* or *Baju Laut*, meaning the Sea Baju, are a maritime people in the Arru islands, who venture far to sea. Many of the Baju remain throughout the year near the Dutch settlement of Macassar, on the south end of Celebes, where they are found very useful in carrying despatches. They are chiefly employed by the Chinese in fishing for trepang, or sea-slug, and according to the policy invariably adopted by the latter in their dealings with the natives, are generally involved in debt, from which extrication is nearly hopeless. The demand against each boat or family usually averages about four hundred guilders (twenty-five pounds sterling), and, extraordinary as it may appear, no instance is on record of their ever having absconded to avoid the payment of their debts.

Vorkay, is an island lying exposed to the ocean at the south-eastern extremity of the Arru group, and is of great importance from the pearl fishery. At a distance of eight miles to the eastward, lie several small islands, between which and Vorkay the trepang banks are situated. At low water, hundreds of men, with their wives and children, may be seen wading from Vorkay towards these isles (the water being only two or three feet deep,) carrying a basket at their backs, and having in their hands a stick.

Bo, is an island of the eastern Archipelago inhabited by a mixed race of Papuans and the brown race.

Ceram Laut, a cluster of islets lying off the south-eastern extremity of the large island of Seran, or Ceram in lat. 3° 55' S. and 133° E. They produce tortoise-shell, mother-of-pearl-shell, beche de mer, wild cinnamon, wild nutmegs, and birds of paradise. Ceram Laut, is the most westerly and the largest of the range of small islands which extend 15 to 18 miles E. and W. Ceram Laut, means Ceram lying to sea-ward : its islands are low. *Ceram Laut*, is the great place to which the Bugis carry the Papuan slaves whom they steal from New Guinea. Ceram Laut, and Goram are seldom visited by Europeans. The natives of the Ceram Laut islands repair chiefly to the northern coast of Papua, or the island of New Guinea, from which they are distant only about a day's sail, to procure the various articles of produce we have mentioned—that part of this vast island being called, by the Bugis, Papua-nothing. Mother-o'-pearl-shells are, however, procured by the Bugis themselves in greater quantities at the Arru islands from Gilolo, partly from New Guinea. Although the inhabitants of the Arru islands are represented by the Bugis

as being of the same race as the Papuans, they enjoy a much more unrestricted intercourse with the inhabitants, who trade freely with them and permit them to settle. Mother-o'-pearl-shell is obtained here in great quantities, and tortoise-shells and trepang or beche de mer, are also procured. The Arru people employ their Papuan slaves in diving for the mother-o'-pearl-shell, and in fishing for beche de mer. The people of the Ceram isles appear to have themselves little or no communication with the Arru islands. Mr. Bikmore says that at Ceram the custom of head-hunting prevails amongst the Alfura.

Alfura, a name applied to the Papuans, is written *Alfora*, *Alafora*, *Arafura* and *Halafora*, and according to Mr. Crawford it is from the Arabic *al* and *fora*.

The *Keffing* group consist of 17 islands. Their inhabitants resemble those of the S. coast of Ceram, and are not of the Papuan or negro race, they are great traders and constantly visit New Guinea, and purchase birds of paradise, luri, crows, pigeons, megapodiidæ and scented woods.

Flores, the large island of Flores, the fifth in a line east from Java, due south of Celebes, and of volcanic formation, affords the first example of a race of men seemingly intermediate between the Malay and Papuan, or Negro, but partaking far more of the physical form of the former than of the latter. The complexion is a good deal darker than that of the Malay, the nose flatter, the mouth wider, and the lips thicker. The hair is not lank as in the Malay; but buckles, without frizzling as in the Papuan. The stature is the same as that of the Malay, that is short and squab. According to the statements made to Mr. Crawford by Bugi traders, themselves settlers in the island, Flores is inhabited by six different nations, speaking as many different languages; the Ende, the Mangarai, the Kio, the Roka, the Konga, and the Galeteng, names derived from the principal places of their residence.

Goram, a group of three islands in the East Archipelago. S. E. of Goram is a high group composed of raised coral reefs 300 or 400 feet, with a volcano on the island of Teor which broke forth in 1659. In the Goram group, at Manowolko, east of Ceram, a slight infusion of Papuan on a mixture of Malay and Bugi has produced a good looking people. The Goram people are wholly traders, every year they visit the Tenimber, Ke and Aru islands, the whole N. W. coast of New Guinea, from Oetanata to Salwatty and the islands of Waigiou and Mysol. They also extend their voyages to Tidore, Ternate, Banda and Amboyna. Their prahus are all built by the Ke islanders, who annually turn out hundreds of neat boats. The Goram peo-

ple trade in trepang, medicinal Mussoi bark, wild nutmegs and tortoise-shell, which they sell to the Bugi traders at Ceram Laut and Aru.

New Guinea, &c.—The whole of the great island of New Guinea, the Ke and Aru islands, with Mysol, Salwatty, and Waigiou, are inhabited almost exclusively by the typical Papuan, and the same Papuan race extends over the islands east of New Guinea as far as the Fiji islands. The people on the coast of New Guinea are in some places mixed with the browner races of the Moluccas. In the typical Papuan, the colour of the body somewhat varies: generally it is a deep sooty brown or black, somewhat approaching, but never quite equalling, the jet-black of some negro races, but it is occasionally a dusky brown. The hair is harsh, dry and frizzly, growing in little tufts or curls, which in youth are very short and compact, but afterwards grow out to a considerable length forming the compact frizzled mop, which is the Papuan's pride and glory. The face has a beard of the same frizzly hair, and the arms, legs and breast are also more or less clothed with hair of a similar kind. In stature, the Papuan is superior to the Malay, and the equal or superior of the average European. The legs are long and thin, and the hands and feet larger than those of the Malay. The face is somewhat elongated, the forehead flattish, the brows very prominent, the nose is large, rather arched and high, the base thick, the nostrils broad with the aperture hidden, owing to the tip of the nose being elongated. The mouth is large, the lips thick and protuberant. He is impulsive and demonstrative in speech and action, his emotions and passions express themselves in shouts and laughter, in yells and frantic leapings. Women and children take their share in every discussion. The Papuan has much vital energy? In the Moluccas, Papuan slaves are often promoted to places of considerable trust. He decorates his canoe, his house, his domestic utensils with elaborate carving. They are often violent and cruel towards their children. The Papuan is black-skinned, frizzly-haired, bearded and hairy-bodied, long-faced, has a large and prominent nose, and projecting eyebrows, is bold, impetuous, excitable and noisy, joyous, laughter-loving and displays his emotions. If the tide of European civilization turn towards New Guinea, the Papuan like the true Polynesian of the farthest isles of the Pacific will no doubt become extinct. A warlike and energetic people who will not submit to national dependence or to domestic servitude must disappear before the white man. The Papuan race is found in all the islands as far east as the Fiji. Mysol and Waigiou are Papuan, mixed, partly.

Dory.—The Papuans of Dory worship, or rather consult, an idol called "Karwar," a figure rude-

ly carved in wood and holding a shield. Every house is provided with the idol, which is usually about eighteen inches high, is exceedingly disproportioned, the head being unusually large, the nose long and sharp at the point, and the mouth wide and well provided with teeth. The natives have also a number of "Fetishes," generally carved figures of reptiles, which are suspended from the roofs of the houses, and the posts are also ornamented with similar figures cut into the wood.

Within the geographical limits of the Indian Archipelago, the Papuans only appear as inhabitants of the sea coast in New Guinea and the islands immediately adjacent. In other parts of this region they are found only among the mountain fastnesses, maintaining an unequal struggle with the brown races by whom they are surrounded. In some of the Spice islands, the group nearest to New Guinea, their extirpation is matter of history, as observed by Mr. Crawford ("History Ind. Archipelago," vol. i, p. 18.) In Ceram and Gilolo a few scattered remnants of the race still exist; but they hold little or no intercourse with their more civilized neighbours, flying into the thickets which afford them shelter and concealment on the first appearance of a stranger, experience having taught them that death or captivity will be their fate if they fall into the hands of their natural enemies. The characteristics of the mountain Papuans must therefore be sought in those islands where their numerical strength permits them to lead a life more fitted for human beings than that of their hunted brethren. It is an error to suppose that these poor creatures disappear before civilization. Their chief destroyers are the wild and warlike hunting tribes of the brown race; and, excepting the case of the Moluccas, wherever European civilization has been introduced, the Papuans are more numerous than elsewhere. In the Philippines, for example, their number in the year 1842 amounted to 25,000 souls. (Mallat, "Les Philippines," &c., vol. i, p. 97, Paris, 1846.)

Mysol.—The large island of Mysol or Massal, which lies nearly midway between the north-western extreme of New Guinea and Ceram, is said to have been occupied exclusively by Papuans when this region was first visited by Europeans, and they still form the bulk of the inland population, but the villages of the coast are occupied by a mixed race, in which the Papuan element, however, prevails. The islands of Goram, Ceram-Laut, Bo, Poppe, Geby, Patani, Hoek, and the south-eastern extremity of Gilolo, are also occupied by people of the mixed race, who are remarkable for their maritime activity, and for their friendly disposition towards European strangers.

Philippines.—The woolly-haired tribes are more numerous in the Philippines than in any other group of the Indian Archipelago, with the exception of New Guinea. M. Mallet, as already stated, gives the amount of the "Negrito" population in 1842 as 25,000. This can only be considered as approximative, still it is probably not far from the true amount. The race, therefore, can scarcely be less numerous now than on the first arrival of the Spaniards more than three centuries ago. Indeed, their distribution among the islands of the group seems to have been much the same then as at the present day; for the island on which they were first seen was named by Magellan "Isla dos Negros," to distinguish it from the adjacent island of Zebu, where his ships remained for some months. Negros still contains a large population of Papuans, while Zebu is altogether free from them, and no record exists of their having ever been found there. Samar and Leyte are similarly situated with Zebu, but Mindanao and Mindoro contain several tribes of Negritos, and they form the chief population of the less accessible parts in the mountain ranges of Luzon, the largest island of the Philippine group. The accounts of the Negritos given by the early Spanish navigators perfectly apply to their present condition. They are described as being smaller, more slightly built, and less dark in colour than the negroes of Africa, and as having features less marked with the negro characteristics, but as having woolly hair. The entire population of the Philippine Archipelago, is estimated at 4,000,000, of whom $3\frac{1}{2}$ millions are christians. The Indian races are in general superstitious, credulous, fond of gaming, and particularly addicted to cock-fighting. The Negritos are said to be the original inhabitants of the islands who retired before the invading Indians. The extent of this Archipelago is 300 leagues from north to south, and 180 leagues from east to west. It is made up of countless islands, traversed by a mountain range, and partially fertilized by the overflow of spacious lakes. This Archipelago received its name after Philip the Second of Spain, in whose name they were finally conquered, pacified, and peopled. The Negritos of the Philippines, are polytheists, but without temple or ritual. They believe in omens, invoke Camburan (God), the moon and stars, and adore the rainbow after a storm. They have also a worship of ancestors, a god of the harvest, of the fisherman and hunter; and a remnant of fetishism in a grotesque native devil. Iloco is one of the languages spoken in the island of Lucon. In the Philippines are many separate nations or tribes, speaking distinct languages unintelli-

gible to each other. The principal tongues of Luçon are the Tagala, the Pampanga, the Pangasinan, and the Iloco, spoken at present by a population of 2,250,000 people, while the Bisaya has a wide currency, among the southern islands of the group. Leyte, Zebu, Negros, and Panay, containing 1,200,000 people. Mr. Crawfurd says that it does not appear from a comparison of the phonetic character and grammatical structure of the Tagala, with those of Malay and Javanese that there is any ground for fancying them to be one and the same languages, or languages sprung from a common parent and only diversified by the effects of time and distance and that an examination of the Bisaya Dictionary gives different results.

Negros or Buglas island, extends from lat. $9^{\circ} 4'$ to lat. $9^{\circ} 50'$. Of the central group of the Philippines, consisting of Panag, Negros, Samar, Leyte, Masbate, Bohol, and Zebu, the two former are the only islands in which Negrito tribes exist to the present day, and even as regards Panag, the fact must be considered doubtful. Negros, however, contains a considerable Negrito population, the crest of the mountain range, which extends throughout the length of the island, a distance of one hundred and twenty miles, being almost exclusively occupied by scattered tribes.

Sumba.—Remnants of Papuan tribes may yet be found in Sumba or Sandalwood Island, Buru, the Xulla Islands, and the small eastern peninsula of Celebes, which terminates at Cape Taliabo. Sumba is a mountainous island, three hundred miles in circumference, lying to the south of Flores, from the coast of which it is distinctly visible in clear weather. The inhabitants of Savu possess a settlement near the south-west extreme of the island, and the Bugi traders of Ende have two or three small stations on the north coast which are occasionally visited by small European vessels for the purpose of obtaining horses; but the natives of Sumba all dwell in the uplands, where they cultivate maize, yams and other produce similar to that grown on Timor, and are said to use the plough, which is unknown in any other island to the eastern of Sumbawa.

Flores, is called also Endie or Mangerye, and is an extensive island of the Archipelago, 201 miles long from E. to W. and from 42 to 45 miles broad. It is so named from the Portuguese word 'flor,' a flower, but is called Ende and Mangerye, from its chief south and west ports. Its chief trade at Ende is with Sumba or Sandalwood Island; the Mangerye port trades with the Bugi and Malay. The coast is occupied by the Malay or brown race, but in the interior is a people with frizzled hair, and a similar frizzled hair people live in the mountainous parts of Solor, Pintah, Lombatta and Ombay. On the south coast of Flores is a

tribe called Rakka who are reported to be cannibals, accustomed to eat their enemies and their own relatives who die.

Timor island, lat. $10^{\circ} 23'$ S. to lat. $8^{\circ} 21'$ S., and long. $127^{\circ} 15'$ E. to long. $123^{\circ} 30'$ E. is about 249 miles long and 60 broad, and is formed of high undulating mountains in the interior, though near the sea, it is of moderate elevation. The Portuguese settlement of Dieli or Diely, is in lat. $8^{\circ} 34'$ S. and long. $125^{\circ} 40'$ E., and on the north side of the island. Timor is occupied by tribes much nearer to the true Papuan than those of the Moluccas. The Timorese are dusky brown or blackish, with bushy frizzled hair, and the long Papuan nose. They are of medium height and of rather slender figures. They are said to be great thieves; the tribes are constantly at war with each other, but they are not very courageous or blood-thirsty. They reverence the custom of "tabu" which they call "pomali," and a palm across a door indicates that the ceremony has been performed. In their excitable disposition, loud voices and fearless demeanours, the Timorese closely resemble the Papuan people of New Guinea. In the islands west of Timor, as far as Flores and Sandalwood island, a very similar race is found, which also extends eastward to Timor-Laut, where the true Papuan race begins to appear. Timor seems to form the north-east end of the great range of volcanic islands, which extends north-east and south-west from Timor to Sumatra. It has only one active volcano, Timor Peak, near the centre of the island, which was blown up during an eruption in 1638, and has since been quiescent. Coupang in the west end of the island is the chief Dutch town, and Delhi, in the eastern part of the island is the capital of the Portuguese possessions. There is nothing that could be called a forest, and the whole country has a parched and dry appearance. There are Malays and Chinese, but the native Timorese preponderate and have nothing in common with the Malays, but are much more closely allied to the true Papuans of the Aru islands and New Guinea. They are of the Papuan type, tall, have pronounced features, large, somewhat acquiline, noses and frizzly hair. The women talk to each other and to the men with loud voices and with a self-asserting, quite different from Malay women. The mountaineers of Timor are a people of Papuan type, have rather slender forms, bushy frizzled hair, and the skin of a dusky brown colour. They have long somewhat acquiline nose, with the overhanging apex, which is so characteristic of the Papuan, and so absolutely unknown among races of Malayan origin. On the coast, there has been an admixture of Malay, perhaps of hindoo, as well as of Portuguese, and the coast occupants have wavy, not frizzled hair,

lower stature with less prominent features and the houses are built from the ground. The houses of the Papuan mountaineers are raised on posts. The dead of the Papuan-Timorese are laid on a stage six or eight feet above the ground, sometimes open, sometimes covered, and are retained there till money for a feast can be obtained, when they are burned. The "Ponali" exactly resembling the Taboo of the Pacific, is in full operation here, and a few palm leaves stuck outside of a garden will preserve it from any thief. The inhabitants of the south-western part of Timor, in the neighbourhood of Coepang, are an exceedingly dark, coarse-haired people, and travellers have great difficulty in coming to a conclusion as to whether they belong to Malayan or Papuan races, so equally balanced are their characteristics. The anonymous author of an excellent "account of Timor, Rotti, Savu, Solor, &c.," in Moor's "Notices of the Indian Archipelago," seems to have fallen into this state of perplexity; and as his observations are evidently the result of long experience at Coepang and its neighbourhood, the following are a few short extracts which bear upon the point. The natives are generally of a very dark colour, with frizzled, bushy hair, but less inclining to the Papuans than the natives of Ende, on the island of Flores. They are below the middle size, and rather slight in figure. In countenance they more nearly resemble the South Sea islanders than any of the Malay tribes. The people of the neighbouring island of Semao, are like those of Timor, with frizzly or wavy hair and a coppery brown colour. Amongst the birds of Timor few are ornamental. There are *Platycercus vulneratus*, a green species of Geoffroyus; *Tropidorhynchus timorensis*. *Ptilonopus cinctus*, a white-headed pigeon; the pretty little lorikeet, *Trichoglossus enteles* and *T. iris*; *Sphæcothera viridis*; a green Oriole; and the red *Cyornis hyacinthina*. Of the butterflies, *Papilio ænomaus* and *P. iris*, the swallow-tailed butterflies occur, also *Cethosia leschenaultii* and several *Pieridæ*. Small quantities of copper and gold are found. The land mammals in Timor are only seven in number, *Macacus cynomolgus*, common all over the Indo-Malayan Archipelago; *Paradoxurus fasciatus*, a civet cat; *Felis megalotis*, a tiger cat; *Cervus timoriensis*; *Sorex tenuis*, and *Cuscus orientalis*. The south-east coast of Timor near Mount Allas is, according to Bickmore, occupied by the Papuan race with frizzled hair in tufts. Mr. Earl says that some of the people on the table-land back of Delli, have opaque yellow complexions with hair of a reddish or dark auburn colour, and that the hair of others is straight, fine and of a reddish hue and that every intermediate variety of hair and complexion between this and the black or deep

chocolate colour and the short tufted hair of the mountain Papuan is found in Timor, and it is possible that the races are there mixing as its position is next to Papua.

Waigiou.—The language spoken at Waigiou is entirely Papuan being that which is used on all the coasts of Mysol, Salvatty, the N. W. of Guinea and the islands in the Great Geelvink Bay. Waigiou, Guebe, Poppa, Obi, Batchian between New Guinea and the Moluccas as well as the south and east peninsulas of Gilolo possess no original tribes but are inhabited by people who are evidently mongrels and wanderers.—*Newbold in Royal Asiatic Journal*, 1845; *Mr. Earl and Mr. Logan in Journal of the Indian Archipelago*, Nos. iv, and vi, Vol. iv, May and June, 1850, pp. 323-335, 341-43, 682, 683, 684; *Mr. Earl, Papuans*, pp. 6 to 185; *Macgillivray's Voyage*, Vol. i, pp. 275-7, 280; *Lubbock's Origin of Civil*, p. 122, 335; *Quarterly Review*, No. 232, p. 512; *Bickmore, Archipelago*, p. 242; *Marsden's History of Sumatra*; *Crawford's History of the Archipelago*; *Cooke's Voyages, Asiatic Researches*; *Symes' Embassy to Ava*; *Lt. Wilkes' Narrative of the United States Exploring Expedition*; *Mr. Russell Wallace, Eastern Archipelago*, Vol. ii, pp. 141 to 180; *Mallet les Philippines*, Vol. i, p. 97, in *Journal Indian Archipelago*. PAPULLARIA CRYSTALLINA, *Rorsk.*
Syn. *Trianthema crystallinum*, *Vah.*

PAPURA, *HEND.* *Gardenia latifolia*, *Ait.*

PAPYRUS, a genus of plants belonging to the natural order Cyperacæ. This generic term has been derived from the name of a water plant, whose soft cellular flower-stem afforded the most ancient material from which paper was prepared, and the English word paper is derived from it. It has a stem from 3 to 6 feet high, with 3 acute angles, one of which, according to Bruce, is always opposed to the current of the stream in which it grows, as if to break its force. Its leaves are long and grassy, with a sharp keel. The flowers, which are green, are produced in very large compound umbels, with extremely numerous drooping triangular slender radii, terminated by very long filiform involucreal leaves, within which are placed the spikes of flowers, each consisting of from 6 to 13 florets. It has been regarded as a species of *Cyperus*, and called *C. Papyrus*. It is also considered a distinct genus, and is named *Papyrus antiquorum*. It is a very common plant in Abyssinia, Egypt and Syria, and is also met with in Calabria and Sicily; in gardens it is not uncommon. It inhabits both stagnant waters and running streams, and,

independently of its ancient employment in the fabrication of paper, has been applied to other uses. The flowering stems and leaves are twisted into ropes; the roots are sweet, and have been employed as food. In Abyssinia, boats are constructed from it, according to Bruce. In Syria the plant is called Babeer. M. Rhizo Rhangabe, Minister of Foreign Affairs in Greece, published, a copy of the remaining portions of an inscription detailing the expenses incurred by the Athenians in the construction of the Erechtheion, in the year before Christ 407. M. Egger drew the attention of M. Didot, by letter, to two of the items published by M. Rhangabe, in which, the cost of two tablets for writing the accounts on is given of two drachma (nearly 9*d.*) each, and the price of two leaves of paper for copies at one drachma and two oboli (or nearly 1*s.*) each. M. Egger states, that these accounts were drawn up on wooden tablets coated with white wax, like those used for the annals of the Roman Pontiffs, and called albums, from their colour. The paper is conceived to have been formed of leaves of the papyrus, and not of the skins of animals, used in Asia for the purpose (as stated by Herodotus), nor of parchment, Charta Pergamena, so called from Pergamus in Mysia. M. Egger assumes that wax tablets were used in place of paper on account of their costing less money, though at the present time they would, of course, be by far the dearer material of the two. A family consisting of four adults, could, it is stated, live in Athens on a sum equivalent to £20 a year, —and, starting from this data, M. Egger infers that the cost of the wax tablets must, according to the present value of money, have been about 3*d.* and that of a leaf of papyrus nearly 4*s.* M. Didot says that the price paid at the period alluded to for a leaf of papyrus corresponds exactly with that of a sheet of vellum at the present day. He agrees with M. Egger, that the paper referred to was the papyrus leaf then an important article of commerce with the Egyptians. The Greeks called it biblos, and the paper made from it chartas, whence the Latin charta, the prepared skins used by the Persians were called dipteri or derria. When the Ptolemies, out of mere literary jealousy, stopped the export of papyrus, in order to deprive Eumenes and Attalus (the king of Pergamus) of the materials for forming books, the latter, whose collection of books already vied with the library of Alexandria, caused great attention to be paid to the manufacture of skins,—these were called Pergaminon and bembrani, whence membrana. The high price of papyrus had, of course, a great effect upon the cost of books. Plato is said to have paid 100 minæ (equal to about £360,) for the three treatises written by

Philolaus, the Pythagorean philosopher,—and Aristotle paid three talents (equal to nearly £650,) for a few volumes which had belonged to Spensippus, a disciple of Plato. As the papyrus was of a spongy texture, and the ink ran into it and made the writing difficult to read, the ancients had a plan of sticking two leaves together cross wise as regards the fibres. This however, only produced a partial cure, and experiments were made in applying a coating of size to fill up the pores. A man named Philotectis at length invented a paste of starch and vinegar, which was looked upon as so important a discovery that the Athenians erected a statue in his honour. It is stated as a remarkable fact that, although the papyrus plant was used so extensively by the Egyptians, who constructed boats and covered houses with the stems, made sails from the bark, fuel of the roots, and clothing and ropes from the fibres, not a single specimen of the plant is now to be found in that country. M. de Saunley states, however, that it may be found in great abundance on the banks of a rivulet in Judæa, between Jaffa and Kaisariéh. When the Arabs began to make paper from cotton, called charta Damascena, from the original place of manufacture, papyrus began to decline in value,—still the competition between the two articles was maintained with vigour until the application of waste flax and hemp to the making of paper was discovered, in the twelfth century. The last named materials were, however, themselves doomed to be superseded by the application of rags to the manufacture of paper.—*London Athenæum*, 2nd May 1857. See *Cyperaceæ*.

PAPYRUS of the Egyptians. See *Sebestens*.

PAPYRUS ANTIQUORUM of the Nile, translated in the Bible, rush and bull-rush, is the sedge from the pith of which the ancients made paper. It is the babeer of Syria.—*Royle*; *Birdwood*; *Layard*; *Nineveh*, Vol. ii, p. 181.

PAPYRUS DEHISCENS. *Nees*.

Cyperus corymbosus, | *Cyperus C. pangorei*, *Roth*
Ilh. Heyne.

Chumati pati, HIND.

A sedge of the Peninsula of India and of Bengal, very common on the banks of the Hooghly, where it helps to bind and protect the banks.—*Voigt*.

PAPYRUS PANGOREI.

Cyperus tegetum, *Roth*. | *C. pangorei*, *Rottl*.

Madoorkati, HIND.

A sedge of the peninsula of India, extremely common about Calcutta and very extensively employed in Bengal for making the elegant, shining, useful mats for which the capital of India is famous, and which are frequently imported into Europe, when green, the culms

are split into three or four pieces which, in drying contract so much as to bring the margins in contact or to overlap each other.—*Eng. Cyc.; Voigt; Royle.*

PAPYRUS TEGETIFORMIS, *Arnott; W. Cont.*

Cyperus midus, *Rozb.* | *Kuchku chiya*, *BANG.*

A sedge of Bengal.—*Voigt.*

PAR, HIND., PERS. A feather.

Par-i-taos, HIND. A shawl-wool cloth or Pashmina of two colours, literally Peacocks feather.

Par-i-purz, HIND. A shawl-wool fabric with a nap.

PAR, a river which rises in the W. Ghauts, in lat. 20° 30', and long. 73° 43' and runs W. into the Indian Ocean. Length, 50 miles. It has no tributaries of note; area drained small, and imperfectly defined. Though rugged, the Concan have many fertile valleys, each of which, for the most part, affords a passage for a small river or torrent, holding a westerly course from the Ghauts to the Indian Ocean. The most fertile spots are on the banks of streams. The rivers abound with fish, but are also frequented by alligators. The Savitree is navigable as far as Mhar, 30 miles from its mouth.

PARA, HIND. Hog deer, *Hyelaphus porcinus*, *Sunder.*, *Axis porcinus*, *Jerdon.*

PARA, SANS. Cattle.

PARA, Güz. HIND. Mercury.

PARABARA, SANS. The most high, a term used by christians for the true God.

PARABARAVASTU, SANS. As conceived by the hindoos, is not the true Supreme Being. As an immaterial being, it is the universal spirit, as a material being, it is the universe, the masculine power is identified with Siva and the feminine power is the so called Sakti.

PARABRAHMA; Brahm, or Para brahm, the supreme or rather the universal spirit, the supreme being, is a name that first appears, in hindoo religious books, in some of the best upanishad, or appendages to the Vedas, of later date than the first three and introducing a different and superior theology. It seems to have been a first effort towards the recognition of a creator, and many hindoos of the present day recognize the Almighty, as an infinite, eternal, incomprehensible, and self-existent being; he who sees everything, though never seen; he who is not to be compassed by description, and who is beyond the limits of human conception; he from whom the universal world proceeds; who is the lord of the universe, and whose work is the universe; he who is the light of all lights, whose name is too sacred to be pronounced, and whose power is too infinite to be imagined, is Brahm! the one unknown, true being, the creator, the preserver, and destroyer of the universe, from whom all souls come and to him

again return. Under such, and innumerable other definitions, is the Deity acknowledged in the Vedas, or sacred writings of the hindoos; but, as has been judiciously observed, while there are learned brahmans who "thus acknowledge and adore one God, without form or quality, eternal, unchangeable, and occupying all space, they have carefully confined their doctrines to their own schools, and have tacitly assented to, or even taught in public, a religion, in which, in supposed compliance with the infirmities and passions of human nature, the Deity has been brought more to a level with our own prejudices and wants; and the incomprehensible attributes assigned to him, invested with sensible, and even human forms." Upon this foundation the most discordant fictions have been erected, from which priestcraft and superstition have woven a mythology of the most extensive character. Mr. Ward describes the hindoos as possessing three hundred and thirty millions of gods, or forms under which they are worshipped. Certain it is, that, in India, the human form in its natural state, or possessing the heads or limbs of various animals; the elements, the planets, rivers, fountains, stones, trees, &c., &c., have all been deified, and become objects of religious adoration. The brahmans allege, "that it is easier to impress the minds of the rude and ignorant by intelligible symbols, than by means which are incomprehensible." Acting upon this principle, the supreme and omnipotent God, whom the hindoo has been taught to consider as too mighty for him to attempt to approach, or even to name, has been lost sight of in the multiplicity of false deities, whose graven images have been worshipped in his place. To these deities the many splendid temples of the hindoos have been erected, while, throughout the whole of India, not one has been devoted to Brahm, whom they designate as the sole divine author of the universe. Strictly speaking, however, the religion of the Brahmans is a monotheism. They worship God in unity, and express their conceptions of the Divine Being, and his attributes, in the most awful and sublime terms. God thus adored is called Brahm, the One Eternal Mind, the self-existing, incomprehensible Spirit. But the will of God, that the world should exist and continue, is also personified by them, and his creative and preservative powers are made to appear as Brahma and Vishnu, while Siva is the emblem of the destructive energy; not, however, of absolute annihilation but rather of reproduction in another form. In the hindoo religion therefore, this triad of persons represent the Almighty powers of creation, preservation and destruction. In their metaphysics, Brahma is matter, Vishnu spirit, Siva time; or in natural philosophy, earth, water and fire. These three persons have wives, the executors

of the divine will and the energies of their respective lords. And in the unbounded rage amongst hindoos for personification, the sun, moon, and all the heavenly host; fire, earth and all natural phenomena, all nature, indeed,—the passions and emotions of human beings, their vices and virtues, are transformed into persons, and act appropriate parts in the turbulent history of man. The preservative and representative powers, being in constant action, are, as have been also their wives and children, fabled to have descended on earth innumerable times in divers places, for the instruction and benefit, including the profitable punishment of mankind. And these endless incarnations have been worked up by the poets with a wonderful fertility of genius and the pomp of language into a variety of sublime descriptions, interspersed with theological and moral texts, that at length they were received as inspired productions and became the hindoo standard of truth. Brahma, the creative power, is not specially adored in temples, dedicated exclusively to him. His creative duties over, his portion of the divine activity ceased to operate on the hopes and fears of mankind. In their mythology, however, the hindoos narrate fabulous persecutions and warfare which overthrew Brahma, his temples and worship; and the sects of Vaishnava and Saiva, now comprise all the individuals of the races in India, distinguished by the appellation of hindoos. A philosophic few excepted, they are worshippers of a superstitious and idolatrous polytheism, and the hindoo erects no altars to Brahm, the infinite, incomprehensible, self-existing spirit, “which illumines all, delights all, whence all proceed; that by which they live when born; and that to which all must return.” The Narayana of the hindoo of the present day is rather the Spirit of God, moving on the water, and can be regarded but as the spirit of Brahm, Ins. of Menu, ch. 1, v. 10, though the two hindoo sects claim for their Vishnu and Siva, the title of Narayana, and Brahma himself is sometimes called Narayana. At present there will not be found two hindoo families whose belief is identical, though almost all the educated of the people recognise one God, under one name or another. God thus adored is Brahm; the One Eternal Mind, the self-existing incomprehensible Spirit. From time to time great reformers rise condemning the prevailing hindoo idolatry and so anxious are the people to know the truth, that every new teacher immediately gathers around him a number of disciples. See Brahm, Hindoo.

PARABUNATHA, Sams. *Cassia tora*.

PARACHALI, HIND, a caste of traders, in the Panjab, their merchandize is carried by the Kabuli, Tajik and some of the Khaibar tribes.

PARA-CHATEN, MALAY. *Pteromys petaurista Pallas*, Bly.

PARADESI or Pardesi, HIND. Wandering devotees from northern India; any foreigner from Hindustan.

PARACLETE. Mahomedan doctors unanimously teach, that by the Paraclete, or, as they choose to read it, (John xvi, 7.) “The Periclyte, or Illustrious,” their prophet was intended, and no other.—*Sale's Koran*, Ch. clxi.

PARADISE BIRDS.

Papua Birds,	ENG. Burong Mati,	ARV.
Manuk devata,	JAV. Papua,	TAAG.
Ave do Pardiso,	PORT. Soffu,	
Burong devata,	MALAY. Sioffu,	

Of the various species of birds of paradise, named by the Indians, birds of Ternate; (*Valmont de Bomare, Histoire Naturelle*, iv, 296), by the Ternatians, birds of God; (*Valentyn's, Indian Archipelago*, iii, 306-313) by the Dutch, king's birds; (*Forrest's voyage to New Guinea*, 142), and by the Spaniards, birds of the sun. (*Aldrovandus, Valmont de Bomare*, iv, 297), the name Manuco-diata, or bird of God, has been adopted in modifications by several naturalists. (*Margrav, Brasil*, 207; *Rai, Syn. Av.* 21-27; *Briss*, 2-130; *Buffon's Hist. Nat. des Ois.*, iii, 207). These, the great Promeropes, (*Pritchard's Researches*, i, 83), the most beautiful of winged creatures, were fabled also by the fancy of the Arabian poet, as visitants from heaven to earth; and among the islanders of the Archipelago it is believed that when old, and feeling the approach of death, the paradise birds fly upward towards the sun; but having spent their strength in the inferior world, fail to reach again their celestial home, fall and die as they descend, a graceful fancy not forgotten by the moralist or the poet; (*Camoen's Lusiad*, book x). No representation can exaggerate their beauty, or excel the lustre of their plumage. They were supposed footless, and incapable of alighting, until it was discovered that the Indians cut off their feet before preserving them. They fly always against the wind. They are caught in New Guinea, the Aru islands, Mysol, Salwatty, Waigiou; (*Crawford's Journ. Ind. Arch.*, v, 182), with a species of bird-lime. In the nutmeg season also they come from their breeding grounds in the interior of that vast island, and sail in flocks of thirty or forty over the eastern borders of the Archipelago. They form valuable articles of export. Europe is supplied chiefly from Batavia, China from the Molucca and Aru isles, while the natives of that remote group, with many of the Malays, adorn their casques at martial pageants with feathers plucked from their glittering wings; (*Valentyn's, qu, Forrest's voyage to New Guinea*, 142). In the genus *Paradisea* of Linnæus, many birds were included since transferred to other

genera, but three species of birds of paradise are still included in that genus. These are

P. apoda, Linn., with back of deep maroon-brown, contrasting with the golden-fulvous neck. It is the *P. major* of Shaw. It has peculiar dense feathering on the breast.

P. papuana, Bechstein, (*P. minor*, Forster) back of a pale golden-brown, shading into the golden-fulvous of the neck which is continued all round the neck only, in this species.

P. rubra, Cumer, (*P. sanguinea*, Shaw) is bright golden-fulvous, on the crown, neck and back, its axillary plumes are gorgeous red.

All have short velvety feathers of a golden-fulvous hue on the crown and nape, with the throat and forehead deep, dark satiny green.

All those met with in commerce have small feet, head and wings, owing to the mode of preparing them. The living bird is a model of symmetry. The adult male birds have ornamental tufts of long airy plumes growing from under the wing like the purple honey sucker of India, and in two species the middle pair of tail feathers are long, wiry, barbless stems, and in the red kind, have a broad flat ribband of whalebone substance. The beautiful little creature popularly known as the king-bird of paradise, the *Cincinurus regius*, has a deep emerald green disc on the middle tail feathers; the *Samalia magnifica* has huge neck tufts; in the *Parotia sex-setacea*, the feathers of the flanks are a large floccose mass. The splendid *Lophorina superba* has its scapulary feathers enormously developed like an erectile mantle and is peculiarly adorned on the breast. The entire group is peculiar to Papua or New Guinea and the Arru islands. They are shot with sharp or blunt arrows. They are as omnivorous as the crow, fond of displaying their plumage, and like the turkeys, argus pheasants and the dancing bird of America, *Rupicola cayana*, are fond of displaying their plumage. It is, however, not solely to the genus *Paradisaea* that the term Birds of Paradise is given. Mr. Russel Wallace, applies it to the following:—

Paradisaea apoda, the Great Paradise Bird, in the Arru islands.

Paradisaea papuana, the Lesser Paradise Bird in New Guinea, Mysol and Jobie.

Paradisaea rubra, the Red Paradise Bird in Waigiou.

Cincinurus regius, the King Paradise Bird, in New Guinea, Arru islands; Mysol, Salwatty.

Diphyllodes speciosa, the Magnificent in New Guinea, Mysol and Salwatty.

Diphyllodes wilsoni, the Red Magnificent, in Waigiou.

Lophorina atra, the Superb in New Guinea.

Parotia sexpennis, the Golden Paradise Bird, in New Guinea.

Semioptera wallacei, the Standard Wing, in Batchian and Gillolo.

Epimachus magnus (*Upupa magna*, Gm. *U. superba*, Lath.) the Long-tailed Paradise Bird. Body generally black or brownish-black; tail graduated, thrice as long as the body (Lesson says three feet in length, French); feathers of the sides elongated, raised, curled, glittering on their edges with steel-blue, azure, and emerald-green, like precious stones; the head and the belly lustrous also with steel-blue, &c. In truth, language fails to convey any just idea of the magnificence of this species. It inhabits the coasts of New Guinea.

Seleucides alba, the Twelve wired Paradise Bird in New Guinea and Salwatty.

Ptiloris magnifica, the Scale-breasted Paradise Bird, New Guinea.

Ptiloris alberti, Prince Albert's Paradise Bird in North Australia.

Ptiloris paradisaea, the Rifle Bird, in East Australia.

Ptiloris Victoriae, the Victoria Rifle Bird, in N. E. Australia.

Astrapia nigra, the Paradise Pie, in New Guinea.

Sericulus aureus, the Paradise Oriole, in New Guinea and Salwatty.

With no family of birds has fiction been more busy than with the Birds of Paradise. The high value set upon them awakened the cupidity and fraud of the Chinese, who made up from parrots, parakeets, and other artificial Birds of Paradise.

Parotia sexsetacea, the Siflet, is the *Paradisaea aurea* of Gmelin.

Lophorina superba. The Superb, is the *Paradisaea superba* of Latham.

Cincinurus regius is the *Paradisaea regia* of Linnaeus and King-bird of Paradise of Petiver, from the Molucca islands.

Paradisaea magnifica of Latham, the *P. apoda* of Linnaeus, is perhaps the most elegant of all these birds; is that which is best known and most often seen. It is the great Emerald, Le grand Emeraude, of the French. "The Birds of Paradise," says M. Lesson, or at least the Emerald, the only species concerning which we possess authentic intelligence, live in troops in the vast forests of the country of the Papuans, a group of islands situated under the equator, and which is composed of the islands of Arru, Waigiou, and the great island called New Guinea. They are birds of passage, changing their quarters according to the monsoons. The females congregate in troops, assemble upon the tops of the highest trees in the forests, and all cry together to call the males. These last are always alone in the midst of some fifteen females, which compose their seraglio, after the manner of the gallinaceous birds. In order

to shoot Birds of Paradise, travellers who visit New Guinea leave the ship early in the morning, to arrive at the foot of a teak-tree or fig-tree, which these birds frequent for the sake of their fruit—(our stay was from the 26th of July to the 9th of August)—before half-past four, and to remain motionless till some of the males, urged by hunger, light upon the branches within range. It is indispensably requisite to have a gun which will carry very far with effect, and that the grains of shot should be large; for it is very difficult to kill an Emerald outright, and if he be only wounded it is very seldom that he is not lost in thickets so dense that there is no finding the way without a compass. "The little Emerald Paradise Bird feeds, without doubt, on many substances, in a state of liberty. I can affirm that it lives on the seeds of the teak-tree, and on a fruit called Amihou, of a rosy white, insipid and mucilaginous, of the size of a small European fig, and which belongs to a tree of the genus *Ficus*."

In the beautiful little 'King Bird of Paradise' (*Cinnurus regius*), the stem-like middle tail-feathers are broadly barbed at the extremity, where they curl round in a singular manner to form a flat disk, of a deep emerald-green hue; and the axillary tufts are comparatively short, and consist of ordinarily-shaped feathers, which are brown with broad emerald-green tips.

In the *Samalia magnifica*, there are huge neck-tufts, in addition to small axillary tufts; and the middle pair of tail-feathers again assume the form of lengthened stems.

In the *Parotia sex-setacea*, the feathers of the flanks are extraordinarily developed, composing a huge floccose mass; and each side of the head is ornamented with three long stems terminated by a black oval.

In the *Lophorina superba*, the scapular feathers are enormously developed and form a sort of erectile mantle; this splendid creature being also peculiarly adorned upon the breast.

The entire group is peculiar to Papua or New Guinea and its vicinity.

The name *paradiseus* or *paradisi*, has come to imply a long train of ornamental feathers, or other accessory adornment of the kind, in any sort of bird or wheresoever they grow. Even among fishes, the Tapsi or 'Mango-fish' of India is the *Polynemus paradiseus* of Linnæus (a name applied to another species by Bloch), on account of its long lateral filaments. We hear sometimes of 'Birds of Paradise' in India, a misnomer which refers either to the Shah Bulbul, or 'Rocket-bird,' or 'Paradise Flycatcher' (*Tchitreia paradisi*), or to the Bhimraj, or 'Indian mocking-bird,' a species of Drongo or 'King Crow' (*Edolius paradiseus*); the male of the former having its two middle tail-feathers much elongated, and the other

having its outermost tail-feathers prolonged into wire-like stems barbed and twirled at the extremity. In like manner, the *Vidua paradisea* is a Finch-like bird of Africa; the famous Queselt of the ancient Mexicans is the Trogon or *Calurus paradiseus*; and even the Stanley Crane, with elongated tertiaries sweeping down to the ground, is the *Grus paradisea* of Temminck.

As the genus *Paradisea* is now limited, however, three species only are retained in it:—

1. *P. apoda*, L.: *P. major*, Shaw. Back of a deep maroon-brown, contrasting with the golden-fulvous neck.

2. *P. papuana*, Bechstein: *P. minor*, Forster. Back of a pale golden-brown, shading into the golden-fulvous of the neck.

3. *P. rubra*, Cuvier: *P. sanguinea*, Shaw. Back of the same bright golden-fulvous as the crown and neck; the long axillary plumes, gorgeous red; and broad flattened middle tail-feathers, like long shreds of 'whale-bone.'

In other respects, the general characters are the same. All have short velvety feathers of a golden-fulvous hue on the crown and nape, with the throat and forehead deep dark satiny green, most developed in *P. rubra*, least so in *P. papuana*. *P. apoda* and *P. rubra* have a black chin, and *P. apoda* has a broader green frontal mark than *P. papuana*; while *P. rubra* has the fore-part of the head green to beyond the eyes, the feathers being developed to form two hillock-like tufts on the head, and lengthened also on the sides of the throat, where disposed in concentric series, instead of uniformly as in the others. Moreover, the golden-fulvous of the nape is continued round the front of the neck in *P. rubra* only; and *P. apoda* alone has a peculiar extraordinary denseness of feathering on the breast.

P. apoda remarks Mr. Bennett, writing of a bird he saw at Macao in a cage, has light, playful, and graceful manner, with an arch and impudent look: dances about when a visitor approaches the cage, and seems delighted at being made an object of admiration. Its notes are very peculiar, resembling the cawing of the raven, but the tones are by far more varied. During four months of the year, from May to August, it moults. It washes itself regularly twice daily, and, after having performed its ablutions, throws its delicate feathers up nearly over the head, the quills of which feathers have a peculiar structure, so as to enable the bird to effect this object. Its food during confinement is boiled rice, mixed up with soft egg, together with plantains and living insects of the grasshopper tribe: these insects, when thrown to him, the bird contrives to catch in its beak with great celerity: it will eat insects in a living state, but will not touch

them when dead. The bird, previously to eating a grasshopper given him in an entire or un mutilated state, placed the insect upon the perch, kept it firmly fixed with the claws, and divesting it of the legs, wings, &c., devoured it, with the head always placed first. It rarely alights upon the ground; and so proud is the creature of its elegant dress, that it never permits a soil to remain upon it, and it may frequently be seen spreading out its wings and feathers and regarding its splendid self in every direction, to observe whether the whole of its plumage is in an unsullied condition. It did not suffer from the cold weather during the winter season at Macao, though exposing the elegant bird to the bleak northerly wind was always very particularly avoided.

Amongst the birds of the Arru islands are *Monarcha chrysomela*, a fly-catcher of black and bright colours, and *M. telescopthalma*, the spectacled fly-catcher.

Paradisea regia, called the Burong raja, also Goby-goby. A very beautiful bird first described by Linnæus, the Great Paradise bird, whose call is Wawk-wawk, wawk, wok, wok, wok.

The Black Cockatoo, si the *Microglossum aterrimum* which delights in the Canary nut.

The racquet-tailed king-fisher of the genus *Tanyiptera*, *T. hydrocharis*.

Alcedo dea, the goddess king-fisher.

The paradise birds of Arru at their pairing season have sacaleli or dancing parties. In certain trees of the forest, with immense heads, spreading branches and large but scattered leaves giving a clear space for the birds to play and exhibit their plumes. The bird is nearly as large as a crow and is of a rich coffee brown colour. The head and neck is of a pure straw yellow above and rich metallic green beneath, and long plumy tufts of golder orange feathers spring from the sides beneath each wing and when the bird is in repose, are partly concealed by them. At the time of its excitement, however, the wings are bent over its back, the head is bent down and stretched out and the long plumes are raised up and expanded till they form two magnificent golfans, striped with deep red at the base. When seen in this attitude it really deserves its name: a dozen or twenty full plumaged male birds assemble together, raise up their wings stretch up their necks and elevate their exquisite plumes, keeping them in a continual vibration between whiles, they fly across from branch to branch in great excitement, so that the whole tree is filled with waving plumes in every variety of attitude and motion. In the Aru islands there occur the great wingless Casuary brush turkeys, the King-hunters "*Dacelo gaudichaudi*;" the fly catching wren, "*Todopsis*," the great crown

pigeon, *Goura coronata* and the small wood doves *Ptilonopus perlatus*, *P. aurantiifrons* and *P. coronulatus*. Amongst Mammals, are *Cuscus maculatus*, a true Kangaroo, also a small marsupial animal *Perameles doreyanus*.

Butterflies, are numerous, and amongst them *Hestia durvillei*, the spectre butterfly.

Drusilla catops, the pale winged peacock butterfly.

Coccytiad urvillei, a clear winged moth, *Ornithoptera poseidon*, the great bird wing butterfly one of the most magnificent insects in the world. Its wings are velvet black and brilliant green, 7 inches across. The blue winged *Papilio ulysses*.

Spiders, and particularly the web-spinning and little jumping spiders are numerous. Lizards very numerous. Hermit crabs abundant. Platypus, and *Tesserocerus* are wood boring insects, of the Arru islands.

Beche-de-mer, tortoise-shells, edible birds nests, pearls, ornamental woods, timber and birds of paradise are the products of the island. —*Illustrations of Indian Zoology*, by Hardwicke and Gray; *Mr. F. D. Bennett*, in his '*Wanderings*'; *Chatfield's Hindoostan*, p. 200; *Sale's Koran*, Vol. ii, c. lxi, p. 436; *Wallace*, Vol. ii, p. 220; *The Malay Archipelago*, Vol. ii, pp. 141 to 220.

PARADISE-FISH, a species of *Polynemus* which is esteemed excellent food in India, and the sound furnishes isinglass.—*Simmond's Dict.*

PARADISE FLYCATCHER, *Tchitrea paradisi*, *Linn*, though not common, its singularly attractive plumage can scarcely escape observation. The adult male has a blue head, white body, with two of the tail-feathers prolonged for upwards of 8 inches beyond the tip; these, in the female, scarcely extend beyond a quarter of an inch. The young birds are chestnut.

PARADISEINÆ, a sub-family of birds comprising, 2 gen. 4 sp. viz. 3 *Paradisea*, 1 *Cinnurus regius*, p. 482.

PARADOXURUS a genus of mammals of the sub-family Viverrinæ.

Paradoxurus albifrons, *Bhot.*, syn. of *Artictis binturong*, *Jerdon*.

Paradoxurus bondar, *Gray*, Terai tree cat.

<i>P. hirsutus</i> , <i>Hodgson</i> .	<i>P. pennantii</i> , <i>Gray</i> .
<i>Baum, Bondar</i> ,	<i>BENG.</i> <i>Machabba</i> , <i>NEPAL</i> .
<i>Chinghar</i> ,	<i>HIND.</i> <i>Malwa</i> , "

Found throughout the Terai, Bengal and Behar.

Paradoxurus derbyanus.

Paradoxurus grayi, *Bennet*. Hill Tree cat.
P. nipalensis, *Hodgson*. | *P. bondar*, *Tamm*.

Paradoxurus fasciatus, a Civet cat, found over much of the Archipelago.

Nepal S. E. Himalaya, Arakan, N. Burmah.

Paradoxurus leucomystax, Gray. Malayana.
Paradoxurus musanga, Palm-cat.

P. typus,	F. Cuv.	P. prehensilis,	Gray.
P. pallasi,	Gray.	Viverra hermaphro-	dita, Pallas.
P. crossii,			
P. dubius,			
Bhondar,	BENG.	Jhar-ka-kuta,	HIND.
Kara-bek,	CAN.	Ud,	MAHR.
Menuri,	HIND.	Murra-pilli,	MALMAL.
Laki t,		Manu-pilli,	TEL.
Khatas,			

Common and abundant throughout the greater part of British India; lurks by day among the fronds of the cocoanut palms, rolled up as a ball. It will live for months in confinement on vegetable food but preferring flesh. It is said to consume the toddy of the palmyra.

Paradoxurus montanus, syn. of *P. zeylanicus*.

Paradoxurus quadriscipitus and *P. strictus* *Hodys.*, syns. of variety of *P. musanga*.

Paradoxurus quinquelineatus, Gray, syn. of *P. strictus*.

Paradoxurus trivargatus, Temm. Malay peninsula and islands.

Paradoxurus tyleri, Blyth, Andamans.

Paradoxurus trivirgatus, Gray. Syn. of *Paguma trivirgata*.

Paradoxurus zeylanicus, Pallas, peculiar to Ceylon. It has a dark variety formerly termed by Dr. Kelaart *P. Montanus* but now described as *P. Zeylanicus*, var. *fuscus* "beetle brown throughout. No streaks on the back perceptible. Fur very glossy; tail with a bright golden yellow subterminal ring. It comes from Newera Elia." In Timor, there are 15 bats, 7 and mammals, amongst them the *Macacus cynomolgus*, the common monkey of all the Indo-Malay islands.—*Tennant's sketches of the Nat. Hist. of Ceylon*, p. 32; *Tennant's Ceylon*; *Jerdon*. See *Viverridae*, Mammals.

PARAFFINE

PARAGI, Paringa or Parimi, TEL. *Zizyplus cenoplia*, Mill.

PARAGUAY TEA. See Mate.

PARAH, Guz., HIND. Mercury.

PARAH, an Indian measure of capacity, two feet square and six and a half inches deep. The internal measure of a standard parah is a cube of 11.57-100ths inches. The weight for various goods according to the Ceylon Custom-house practice is, for coffee, 35 to 50 lbs.; pepper, 27 to 30 lbs.; salt, 52 to 55 lbs.; paddy, 30 to 33 lbs.; husked rice, 42 to 46 lbs. In Bombay eight parah make a candy, by which seeds, grain, &c., are measured; the parah contains 7 paillies, and weighs 19 lbs. 9 oz. 9-6 drs. The parah measure for salt is 1,607-61 cubic inches.—*Simmond's Dict.*

PARAIN PULI, MALMAL. *Felis tigris*, Linn.

PARAIYADI KIRAVAN, also Paraiyan. TAM. A Pariah.

PARAISOO-OOSA, see Hans-Raj.

PARAIYAR, TAM. A Pariah.

PARAJITA TREE, see Meru.

PARAKARI, HIND. A sweetmeat.

PARAKEET, see Parrakeet; *Psittacidae*.

PARAKSHITA, see Barhadhratha.

PARAL, SANS. *Bignonia chelonoides*, also *B. suaveolens*.

PARALI, or Pral HIND. of Panjab, *Oryza sativa*, rice straw, and *Triticum aestivum*, wheat straw, are extensively employed by the hill tribes for snow shoes. Price 2 annas per pair.—*Powell's Hand-book*, Vol. i, p. 521.

PARALIA, of the Greeks, or the country of the Aii, is the present south Travancore.

PARAMAHANSA. This word is used in the ninth volume of the *As. Res.*, p. 318, (Cal. 4to. edit.) where it is applied to "ascetics of the orthodox sect in the last stage of exaltation: they disuse clothing. Now a days, individuals ntirely naked, are perhaps never seen in places of European intercourse; but formerly, dozens sometimes of these brawny saints were to be seen lolling and sleeping in the streets, and on shop-boards, as naked as they were born. They were always treated with great respect, especially by women, who would sometimes kiss the holy man in a mode that we should judge highly indecent, and at all times, hindoo women in passing them, saluted the ascetic. The ascetic and mendicant Sanyasi are of four kinds, the Kutichara, Bahudaka, Hansa, and Paramahansa, who differ from each other only in the graduated intensity of their self-mortification and profound abstraction, but of whom the Paramahansa is the most exalted. He is occupied exclusively with the investigation of Brahṇ or the Spirit, who is equally indifferent to pleasure or pain, insensible to heat or cold, and incapable of satiety or want. Individuals are met with who go naked in all weathers, never speak and never indicate any natural wants, and what is brought to them as alms or food, is received by the attendants, whom their supposed sanctity, or a community of interests attaches to them, and by these attendants they are fed and served on all occasions as if they were as helpless as infants.—*Moor's Pantheon*; *Wilson*. See Hindoo.

PARAMENISPERMIA, see *Cocculus indicus*.

PARAMAR, see Inscriptions.

PARAMARDI, see Inscriptions.

PARAMATMA, the supreme, or rather the universal, spirit. See Sri Sampradaya.

PARAMBU, TAM. *Calamus fasciculatus*, Roxb.

PARAMESWARA, a name of Brahma.

PARAMICIPPA PLATIPES, *Eidus*. One of the Crustacea of the Red sea.

PARAMITA, Rani or queen of the Amazons.

who is mentioned in the Mahabarata as conqueror of Arjuna when he was accompanying the Aswamedha or sacrificial horse.

PARAMITHRAX, a genus of Crustacea, viz.

Paramithrax peronii, *Edws.*, Indian Ocean.

" barbi cornis, *Edws.*, New Holland.

" gaimardii, *Edws.*, New Zealand.

PARAMOOL, BENG.

PARAMPUAN LAUT, MALAY. Halicore indicus.—*F. Cuvier*. Steno malayanus.

PARAND, HIND. Loranthus longiflorus.

PARANDA, a silk material, used as a hair ornament in Lahore. In Akyab it is called Patsan and Patso, and is worn there by the Mug race. The Patso of Burmah, however, is the cloth worn by all classes.

PARANDA, PERS., HIND. A bird.

PARANG, and Szanskar are districts in the N. W. Himalaya, Piti and Guge are Tibetan districts; all east of Piti is Tibetan.—*Hooker et Th.*, p. 190.

PARANG, MALAY. A sword.

PARANGHI SAMBRANI, TAM. Olibanum.

PARAN-THA, BURM. A tree of Moulmein. Its wood is soft and used in ordinary purposes of building material.—*Cal. Cat. Ex.* 1862.

PARANYAN? Champac? A tree of Akyab, which grows to a moderate size, and is procurable in the Sandowy district. Wood used as planking.—*Cal. Cat. Ex.* 1862.

PARAO, a halting place, camp, encampment.

PARAPAMISUS, the ancient Roman name for the mountain range separating central from southern Asia, the Eimak who now graze their flocks in the Parapamisus, are brave and relentless, and Affghans when travelling whether proceeding from Balkh, Kabul, Kandahar or Herat, never enter into the mountain districts of these intrepid nomadic tribes. One of the Eimak tribes is known as the Feroz Kohi after the city of that name about 63 miles from Teheran. Timur, exasperated at the depredations which they committed, transported the whole of them into the mountains lying between Persia and India.

PARAPLUIE, FR. Umbrella.

PARAS, HIND. of Kaghan, Cerasus cornuta, also Prunus padus, bird cherry.

PARASAKTI, SANS. The supreme sakti.

PARASANG, a persian measure of 3 or 4 miles, more or less in different districts.—*Ferrier; Caravan Journeys*, p. 5.

PARASGAR, HIND., of Kashmir, a shawl washerman.

PARAS, also Paras-pipal, HIND. Thespesia populnea.

PARASARYA or Parasaryayana, see Hindoo.

PARASHA, see Siva.

PARASHAWARA, This, the great city now called Peshawar, is first mentioned by Fa-Hian, in A.D. 400, under the name of Fo-leu-sha. It is next noticed by Sung-

Yun in A.D. 502, at which time the king of Gandhara was at war with the king of Kipin, or Kophene, that is Kabul and Ghazni, and the surrounding districts. Sung-Yun does not name the city, but he calls it the capital, and his description of its great stupa of king Kia-ni-sse-kia, or Kanishka, is quite sufficient to establish its identity. At the period of Hwen Thsang's visit, in A.D. 630, the royal family had become extinct, and the kingdom of Gandhara was a dependency of Kapisa or Kabul. But the capital which Hwen Thsang calls Pulu-sha-pu-lo, or Parashawara, was still a great city of 40 li, or 6½ miles in extent. It is next mentioned by Masudi and Abu Rihan, in the tenth and eleventh centuries, under the name of Parashawar, and again by Baber, in the sixteenth century, it is always called by the same name throughout his commentaries. Its present name we owe to Akbar.—*General Cunningham, Ancient History of India*.

PARASIKA, SANS. Persia.

PARASITE PLANTS, HEB., CHIN.

PARAS-KA JHAR, HIND. Thespesia populnea, Lam.

PARAS NATH, a mountain in Behar of great sanctity: it is the eastern, as Mount Abou is the western metropolis of Jain worship.—*Hooker's Hin. Journ.*, Vol. i, p. 18.

PARAS PIPAL, SANS. Thespesia populnea.

PARASU, SANS. An axe; hence Parasu-Rama, Rama of the axe.

PARASU-RAMA. A prince who is supposed to have reigned B.C., 1176, who gave his name to an era, used still on the Malabar coast, from Mangalore to Cape Comorin. Parasu Rama, was son of Jamadagni. He was a brahman and apparently a village hero. He is fabled to have taught Arjuna the use of arms. In hindoo mythology, he was the sixth incarnation of Vishnu, the destroyer of many Kshatria and the civilizer of Keral or Malabar. Among the avatara of Vishnu are recorded three favoured personages, in whom the deity became incarnate, all named Rama. They are distinguished by the names of Bala Rama, usually called Balaram, Parasu Rama, or Parasaram, and Rama Chandra, and are all famed as great warriors, and as youths of perfect beauty. The first named Bala Rama, was elder brother to Krishna, and greatly assisted him in his wars; so that, in this instance, Vishnu seems to have duplicated himself, as indeed may be also said of the other, for Parasu Rama, and Rama Chandra, otherwise called, patronimically, Daserat Rama, were contemporaries. But it has been made a question, whether they be not three representations of one person, or three different ways of relating the same history: and, whether any, or all of them, mean Rama, the son of Cush, Sir W. Jones, (*As. Res.*, Vol.

ii, p. 132), says, he leaves others to determine. He deems Rama to be the same as the Grecian Dionysos, who is said to have conquered India with an army of Satyrs, commanded by Pan; and Rama was also a mighty conqueror, and had an army of large monkeys, or satyrs, the general or prince of whom was Hanuman, a name said by this author to mean with high cheek-bones: others translate it, with bloated cheeks, alluding to his fabled origin from Pavan, regent of the wind. Rama is also found to have resembled the Indian Bacchus; he is a descendent of the sun, and the husband of Sita; and it is very remarkable, that the Peruvians, whose Incas boasted of the same descent, styled their greatest festival Ramasitoo. Krishna, describing himself to Arjun as the first of all things, says, "Among those who carry arms, I am Rama." Of Parasu Rama it is related that he was born near Agra, in the Tirtya yug, or second age. His parents were Jamadagni, whose name appears as one of the Rishi and Runeke. Runeuka the wife of the Rishi, Jamadagni and mother of Parasurama, is said to be identical with the gramadevata Ellammen. The Parasurama era is current on the Malabar coast. At the birth of Christ 1176 years of the Parasurama era had expired, and the 1177th year began on the 17th August A. D. 1, Julian style.—*Gita*, p. 86; *As. Res.*, Vol. i, p. 426, Vol. iii, p. 68. See Avataram Kerala, Polyandry.

PARASWAPU CHETTU, TEL. Xanthium orientale, Linn.

PARAT, HIND. A flat circular metal tray with a rim.

PARAT, HEB., is the Bhat, or bard of India.

PARATAPA, see Inscriptions.

PARAT-THA, SANS. The other world.

PARATI, MALAB., TAM. Cotton. Gossypium indicum, Lam.

PARATROPIA DIGITATA, Voigt.

P. venulosa, W. & A. | Araba digitata, Roxb.
Pa-loo-let-wa, BURM. | Digitate-leaved Paratro-
pia, ENG.

A large shrub, native of Circars. Paratropia digitata or Paratropia venulosa are also plants of Burmah. The Karens make an infusion of the leaves of a species of Paratropia, which they likewise use for many internal diseases.—*Mason*.

PARATY MARAM, TAM. The Cotton tree, Elaeodendron, grows to about twelve inches in diameter, and twelve feet long, and produces a nut which the natives eat, and on which wild animals feed. It is not of much value.—*Edye*, M. & O.

PARAVAN, MALAB. See Pariah.

PARAVAR, a dark-skinned, almost black race, in the extreme south of the Indian peninsula, living in villages along the sea coast and

earning their bread as fishermen with nets, lines and hooks. They own canoes, which they take to sea before daylight and return about noon. Their ancestors are said to have been converted by Xavier, and they still profess the Romish religion, but they are drunken and dissolute.—*Madras Government Proceedings*.

PARAVATA, SANS. Citrus decumana—Linn., W. & A., Roxb.

PA-RA-WA. In Amherst, a hard, red, compact wood, with large fibre, and fit for gun-carriages or other similar purposes. It is exempt from attacks of insects. It is used for spears and arrows, (a species of Garcinia?)

PARBAT, see Kali.

PARBATI, or Parvati, a hindoo goddess, the mountain goddess, wife of Siva. See Inscriptions, Parvati.

PARBATTIAH, or hill people of Nepaul, are divided into four classes, denominated Awal, Doom, Seoom, and Charum. These are Persian terms, and denote, first, second, third and fourth. The Awal are those peasants who possess five ploughs and upwards; the Doom, such as have from one to five, the Seoom are those who, without being proprietors of ploughs, are considered to be at the head of a few or more labourers; and the lands of Nepaul proper are cultivated, almost without exception, by Newars; those to the westward, as Noorkale, &c., by the Parbatty tribe, called Dherwara.

PARBATI, a hill near Poonah. See Parvati.

PARBATIYA, see India, Khas, Parbatiah.

PARBEIK or Parabeik, BURM. The black note-books of the Burmese, used for writing on with steatite pencils; they correspond entirely to those of the peninsula of India.

PARBHU, a writer-caste in the Bombay presidency, who claim to be pure Khsatrya, the descendants of Chandrasena raja of Malabar. The British in India call them Purvoo.—*Wilson*.

PARBUR PANI, HIND. Trichodesma, sp.

PARBUTTEE, a river near Burkhera in Gwalior, also of Barab in Kotah and near Ashta in Bhopal.

PARBUTTI, see Burabur caves.

PARCHERRY, ANGLO-TAM., from Paraiyan, a Pariah, and cherri a place where the out-caste people dwell.—*Sonnerat's Voyage*, p. 52; *Wilson*.

PARCHA, HIND. A piece of cloth; also well gearing.

PARCHARKAR, HIND. The art of joining in stone.

PARCHMENT.

Parchemin,	FR.	Cartapocora,	IT.
Pergament,	GER.	Pergamino,	SP.

Parchment consists of the skins of sheep and goats, prepared in such a manner, as to

PARDANTHUS CHINENSIS.

render them suitable for being written upon. It is now chiefly employed for charters and other writings where great durability is desirable. The name is from the Latin Pergamena, from Pergamus, the reputed place of its invention. Eumenes II, king of that place (who reigned B.C. 197—159), has the honour of the invention, he being stimulated thereto by the prohibition of the export of papyrus from Egypt, but Herodotus says they were commonly used for that purpose in his time; and it is even asserted that the word pergamena was not used until several centuries after the death of Eumenes. According to Mabillon, the first writer who uses the term is Tatto, a monk of the fourth century; before his time, the word membrana was employed, as in the Greek Testament, II Tim. iv, 18.—*Faukner*; *Tomlinson*. See Hides, Papyrus.

PARCHMENT, VEGETABLE, or Ametastine, is described as applicable for legal deeds, bank notes, policies of insurance, working plans, maps, account books, binding purposes, photography, culinary purposes, paper hangings, artists' drawings and paintings either in oil or water colour. It is made from water leaf or unsized paper, of which ordinary blotting paper is a common example, and it acquires its peculiar properties by being dipped in diluted sulphuric acid, the strength of which must be regulated to the greatest nicety. The material of the surface thus metamorphosed is one of the most unalterable and unchangeable of all organic substances, and its peculiarity requires a distinctive appellation. It is commended for its strength, toughness, flexibility, hardness and solidity of face, stiffness, elasticity, resistance to the action of water; for when dried it resumes its former condition; and indeed in all cases where endurance for long periods is required, this material may be safely pronounced pre-eminently valuable. Gases pass through it in the same way as through animal membranes, whilst it resists the action of most chemicals, acids, and alkalies. It takes writing ink and dyes very readily, and from its perfect surface, receives varnish without being sized in the first instance.

PARCUTILLE, TAM. A Ceylon tree which grows to about twenty-four inches in diameter, and fifteen feet in height. Its wood is used by the natives in boats, houses, and other works: it is not of great value.—*Elye, on the Timber of Ceylon*.

PAREIRA BRAVA.

A native of Nepal and the Himalaya, and common in gardens being a very ornamental flowering shrub. It has a showy yellow and orange flower, whose petals are spotted like a leopard's skin. It is very commonly cultivated by the Burmese. It is used in medicine. The dark, irregular rhizomes of this and other Iridaceous plants are sold in China under the name of Shie kan.—*Mason*.

PARDEK or partok, PUSHTU. The pajama, or trowser.

PARDESI. In southern India, the northern hindoos are so termed by themselves; and by the southern people, the term is equivalent to foreigner, as from northern India. There are 2,705 in Oomraoti.

PARDHI, a sportsman or fowler, a hunter race in the south of India called also Harnpardhi also Shikari, but who call themselves Bhowra.

PARDHI, cultivators in the Maiker district. They are also wood-cutters, this race are part of the Gond.

PARDI PATTI also Pamidi patti, TEL. The cotton plant, *Gossypium acuminatum*, *Roxb.*

PARDO, a money of account of Goa, in the East Indies, of 4 or 5 tanga, and worth about 2s. 6d.—*Simmond's Dictionary*.

PAPE, HIND. Parrotia jacquemontiana.

PAREIRA, ENG. Cissampelos pareira, *Linn.*

PAREIRA BRAVA. *Linn.*

Grieswurz, GER. | Wild vine, Velvet leaf. ENG.

A medicinal root, procured from the Cissampelos pareira, a native of the West Indies and South America, describes six species of cissampelos, viz.

C. glabra, (Peer grug, HIND.) a native of Sylhet, root acrid and used in native medicine.

C. hexandra, (Neemooka, HIND.) a native of Bengal.

C. convolvulacea, a native of Coromandel and Malabar.

C. caepeba, from the Moluccas.

C. hernandifolia, a native of Chittagong.

C. tetrandia, brought from Amboyna. C. glabra, hexandra, hernandifolia and convolvulacea, natives of the peninsula, are, however, all referred by Wight and Arnot to the same species which differs from C. pareira chiefly in the form of the sepals, and the length of the staminal columns. O'Shaughnessy used the Neemooka of Bengal with decided advantage under the same circumstances as the Pareira brava would be employed in. With this and the Menispermum cordifolium, India is but little dependent on other countries for the valuable remedy so justly lauded by Brodie and others *Faukner*; *O'Shaughnessy*, p. 200; *Dr. Roxburgh, Fl. Indica*, Vol. iii, p. 848.

PARESEOSHAN, HIND. *Adiantum venustum*.

PAREYO, SING. Literally, strangers, also called Widiyetto, SING., or people of the high road, a race, near Badulla in Ceylon, supposed to be the descendants of Portuguese captives, with women of rank of the country degraded for crimes, or made slaves after the re-conquest. —*Ten.* ii, 267.

PARGAI, HIND. *Quercus ilex*.

PARGANA, a district, a tract of country, including a number of villages.

PARGUTA, see Tibet.

PARH, HIND. A gun-carriage frame.

PARIA, HIND. *Hyelaphus porcinus Sundev.*, the hog-deer, *Cervus porcinus*.

PARI, HIND., PERS. a fairy; Parizad, born of a fairy, a beautiful woman; the people of the valley of Pishin in Segestan worship fairies.

PARIAH, or Pariar.

Holeyar,	CAN.	Paraiyan,	TAM.
Dher,	HIND.	Paraiyar,	"
Mhar,	MAHR.	Paraiyadi kiravan,	"
Paravan,	MALEAL.	Malla Vadoo,	TEL.

Pariah, is a Tamil term, applied to a people or peoples scattered throughout southern India, who belong to the hindoo religion, though often adhering to a shamanism. They are permitted to marry into each others families. They are regarded by the four castes of hindoos, as of the lowest grade but they are not out-castes or men who have been expelled from other castes. They are not the Madiga Wanlu, of Telingana, many of whom are shoe-makers or workers in raw hides, and still eat creatures which die from disease, and other animals that most races regard as unclean, and who in villages perform the lowest menial offices, such as messengers and scavengers, and are paid by portions of the crops and some small privileges, but are not permitted to reside within the village. The pariah however are usually the serfs of the Sudr agriculturists. Those in the large towns, in the employ of the Europeans in southern India, are quick, intelligent, and active. The race is emigrating with great rapidity, to the West Indies, Mauritius, Cape Colony and the Burmese provinces, &c., where all sectarian or social distinctions are unknown. There are said to be thirteen sub-divisions amongst them. The Pariah are not out-castes, nor are they the lowest of the hindoo castes. Even in the Tamil country, there are ten castes who are lower in the social scale than the Pariah, and from these are excluded the Pallar, who dispute precedence with the Pariah. The Pariah constitute a well-defined, distinct ancient race, independent of all others, and has its own sub-divisions, its own peculiar usages, its own traditions, and its own jealousy of the encroachments of the castes which are above it and below it. And the Pariar, whom St. Pierre's

romance has fabled as a mild, benevolent, subdued being, whenever he has an opportunity, is as severe on other sects as from the custom of the world we would surely expect. The term Pariah, is supposed by Professor Wilson to have its origin in the Tamil, Parai, a drum. Along the border country of the Nizams territories, and in Berar, the hindoos style the Mang and Dher or Pariah, christians, the word being pronounced Kirsan. The Dher, or Dhes of the Dekhan is employed as a watchman and messenger in the village establishments. In the Dekhan the Dher is identified with the Mhar. In some places he performs the duty of scavenger. In the Sagar territory the Dher eat dead animals, clean the skins, and sell them to the Chamars or tanners. In Canara, they are laborers on the soil, and in a very large proportion are slaves, the property of individuals, saleable with or without the land on which they work: they are very numerous, and are there distinguished into twelve subdivisions, who do not intermarry. They are rare in the N. W. Provinces.

The Holiya of the Canarese country is a low man, an out caste, commonly an agricultural labour, the term is from Holi, a field, and in several districts he is a predial slave, being saleable by the owner of the estate, on which he is located either with, or without the land. He is described as a predial slave in Canara, and Coorg; in the former he is said to be a subdivision of the Dher, in the latter one of three principal classes of slaves called Holeyam, Yemaru, and Paleru. In both countries the Holeyam are distinguished by various demonstrations prefixed, which are variously written, and the meaning of which is not explained, as

Maury Holiya.	Kembutta Holiya.
Byr "	Badaya "
Murtha "	Rookhee "
Bulgi "	

of these the only peculiarities noted are, that the Kembatta Holiya is native in Coorg, the rest are natives of Karnata. The Holiya are generally a more faithful class of slaves than others. Amongst the Mare Holiya, the custom of succession through the female line prevails. — *Caldwell*.

PARIAH DOG. *Canis familiaris*.

PARIALA, HIND. *Erythrina arborescens*.

PARIAM, LEPCH. *Talpa micrura, Hodgson*.

PARI BHADRAKAMU, or Pari bhavyamu, SANS. *Erythrina* sp? *Br.* 591 and *W.* 529 both say the coral free and *Br.* adds Devadaru (*Sethia*) the small red fruit of which is in character with the name. *W.* applies it also to the Devadaru or Deodar pine. The 2nd name is likewise given to *Costus speciosus* both in *Br.* and *W.*

PARIDÆ, a natural family of Perching birds

(Insectores). *Parus xanthogenys*, has the head with a full crest of black feathers; occiput, superciliary stripe, and cheeks, yellow; ear-coverts black; back olive; wings and tail black, the former spotted and the latter tipped with white; a broad black line passing down the throat, and extending along the middle of the abdomen; sides of the chest and flanks pale-yellow; bill and feet black; size rather less than that of the greater Tit, *P. Major* (Gould). This bird is a native of the Himalaya Mountains.—

Eng. Cyc. See *Parus*.

PARIGO, HIND. Down or feathers.

PARIHASAPURA, in Kashmir.

PARIJATA, BENG. The Coral tree, *Erythrina fulgens*.

PARIJATA-HARANA, SANS. From *parijata*, a coral flower, and *harana*, to steal.

PARIJATA, see *Kurma*.

PARI JATAMU, or *Paru jatamu*, SANS. *Nyctanthes arbor tristis*, L., a celebrated tree, said to grow in Swarga or Indra's paradise. *W.* 529 has *Erythrina indica* or the coral tree; *Br.* 591 the same and also the *Amaranth* and *Mimusops elengi*, adding that it is a genuine name for all flowers with a jasmine scent. In the *As. Res.* *W.* 244, Sir W. Jones states that it is given to several different genera quite distinct from each other. Mr. Elliot heard it assigned to *Cochlospermum*.

PARIKE GADDA, or *Parike gaddi*, TEL. *Trapa bispinosa*, L. The Sans. syn is *Sahasra virya*, "thousand roots" which according to *W.* 914 is *Cynodon dactylon*, see *Garika*.

PARI KUMATI, TAM. *Citrullus colocynthis*, *Schræd.*

PARILIUM ARBOR-TRISTIS, GÆRTN. Syn. of *Nyctanthes arbor-tristis*.

PARIMI, TEL. *Zizyphus cœnopia*, Mill.—*W.* and *A.* 511.—*Z. Napeca R.* i. 613.

PARINARIUM EXCELSIUM, one of the *Pomaceæ*, a large tree brought to Bombay from Goa: the fruit, which ripens in December and January, resembles a coarse plum, and is held in much estimation.—*Riddell*.

PARINDA, HIND. A light boat of Kashmir.

PARINDAH, PERS. A bird.

PARINGAY-PATTAY, TAM. China root, *Roxb.*

PARINGHEE——? Gunta baringa.

PARIN KAKA VULLI, MALEAL. *Entada pussetha*, DC.

PARISIAYA-WASHAN, HIND. *Adiantum caudatum, venustum*, DC.

PARISNATH, 23° 57' 8" 86° 6' 9" in Behar, a mountain about 200 miles N. W. of Calcutta. Highest summit, 4,469 feet. On the eastern table-land of the Vindya. It is the highest hill of the range of hills separating Lower Bengal from Behar. Like to Aboo on the west, the Jain religionists have covered the summit of this hill with numerous small temples, and the sacred "Charan" or foot-print is also shown. It is annually visited by thousands of pilgrims. Its base is covered with sal forests (*Vateria indica*). Amongst the hindooes, the eastern peak is the most noted. On its top, *Parisenath* obtained nirvan or emancipation from matter. The spot is especially sacred for that circumstance and forms the holiest place of worship to the sect. The hindoo pilgrims climbing to see the last scene of his life and labours are here shown his foot-prints, marking the spot where he obtained his nirvan.—*Schlag.*; *Tr. of Hind.*, Vol. i, p. 200.

PARIS-PATHAR, or *Philosopher's stone*.

PARITI, also *Tali-pariti*, MALEAL. *Paritium tiliaceum*.

PARITHA, see *Ritha*.

PARITIUM MACROPHYLLUM.

Bet-mwæsha, BURM.

A plant of Burmah, which furnishes a useful fibrous material for ropes, being long, soft, pliant and strong, colour brown. *M. E. J. Rep.*

PARITIUM TILIACEUM, St. Hil.

Hibiscus similis, Blume. | *H. tiliaceus*, Linn *Rheede*
H. elatus, DC.

Bela,	BENG.	Paruti,	MALEAL.
Lyè-nya-sha,	BURM.	Belli-patta,	SINGH.

The banks of tide-water streams of Burmah are often damasked with the changeable red and yellow flowers of this large luxuriant bush, whose crooked wandering branches, crossed and locked with each other, spread along the ground heaping the earth with its evergreen foliage. It is common also on the Malabar coast, and supposed not to differ from *H. arbo-reus*, the Maho tree and Mohaut of the West Indies. The species grow abundantly both in the West and East Indies. Forster states, that the bark of this species is sucked in times of scarcity, when the bread fruit fails, and the mucilage with which all these plants abound, will no doubt afford some nourishment. The fibres of its inner bark are employed for cordage by the inhabitants of the South Sea Islands, and by the American Indians: it is said to gain in strength when tarred. The Otaheitan make fine matting from it, and likewise manufacture it into ropes and cords. Voyagers relate that these filaments are adapted to any kind of cordage, even for the rigging of vessels, but rope thus made is not

PARKIA AFRICANA.

nearly so strong as that prepared from hemp. The whips with which the negroes in the West Indies used to be punished, prior to Great Britain emancipating them, are said to have been made from the bark of this species.—*Mason, Royle.*

PARIVELLAMU, or Bhadra Tunga gaddi. *Cyperus hexastachys*, *Rott.*

PARIWARA ISLAND. The natives closely resemble other Papuans to the eastward, but are smaller in stature, and wear the hair frizzled up into a mop projecting backwards.—*Macgillivray's Voyage, Vol. i, p. 293-4.*

PARIYATAKA, see *Indra*.

PARKAR, a district in an oasis north of the Runn of Cutch, the words *par* and *khar*, meaning beyond the salt desert. The Thur and Parkar districts are occupied almost equally by mahomedans and hindoos, sub-divided into classes. They generally use a mixed language called *Dati*, composed of Sindi, Marwari, and Guzerati, though Guzerati is in use in some parts of the district. They are naturally inactive and in manners and customs resemble the Cutchi. They are chiefly occupied in cattle-breeding and as graziers for which they evince a greater preference than for agricultural pursuits. The mahomedans are Syuds, Beloochi, Brahoori, Jhut and Summa. The hindoos are brahmins, and Soda, there are also twenty-five commercial tribes, five outcaste races, the Mengwar, Bheel, Colce, Bala-Shahi and Shikari, and thirteen miscellaneous tribes, Shaikh, Memon, Kunbrani, Gudda, Bujeeer, Mohana, Jokiali, Dookur, Koliali, Amunda, Bhopa, Mahur, Hakra. In the Ahmednuggur Collectorate, there are 111 to the square mile, but in the Thur and Parkar district only nine. See Cutch, Runi, Sind.

PARKIA, a genus of plants belonging to the natural order Fabaceæ and the tribe Mimosæ. It was named by Mr. Brown in honour of the great African traveller Mungo Park. The genus contains only a few unarmed trees, which are found on the west coast of Africa, the peninsula of India, Sylhet, and in the Islands to the eastward of the Bay of Bengal. *Parkia* is distinguished among the Mimosæ-like Leguminosæ by the tubular 5-cleft calyx and the corolla with 5-distinct petals having a more or less imbricate æstivation; stamens 10, hypogynous, monadelphous. Legume many-seeded, 2-valved, with a farinaceous pulp around and between the seeds. Inflorescence, an axillary peduncled and club-shaped spike.—*Eng. Cyc.; Voigt.*

PARKIA AFRICANA is the Nitta or Douratree of Soudan. The farinaceous matter surrounding the seeds is eaten, and also made into a pleasant drink when steeped in water. The seeds are roasted as coffee, then bruised and allowed to ferment in water. When

PARKINSONIA ACULEATA.

they begin to become putrid, they are well washed and pounded, and the powder is made into cakes resembling chocolate, which form an excellent sauce for all kinds of meat.—*Brown* in *Denham* quoted in *Eng. Cyc.*

PARKIA BIGLANDULOÏA, *W. & A.*

Mimosa pedunculata, Rozeb.

Chendu phool, HIND. | Sambrani manu, TEL.
This large and elegant tree was introduced into India from Africa. It is one of the best trees for avenues. It requires care and water regularly. The Malays are said to be fond of the mealy matter which surrounds the seeds, and of the seeds themselves which taste like garlic. The flower buds resemble balls of red velvet. Legumes filled with a farinaceous edible pulp. A very elegant tree of large size, introduced from Africa, the legumes are filled with a farinaceous pulp, the wood is hard and promising, surrounded by an astringent bark. A watery extract has been prepared, the value of which for tanning purposes has yet to be tested. The wood is hard and promising, it is surrounded by an astringent bark. The sweet and farinaceous pulp within the pods is highly esteemed and made into sweetmeats. The natives also make a pleasant drink by diffusing the farina through water. This tree has now been introduced for many years into some of the gardens about Madras.—*Voigt.; Dr. Rid-dell; M. E. J. R.; Cat. Madras Agri-Horticultural Gardens; Dr. Cleghorn in M. E. J. R.*

PARKIA ROXBURGHII, *G. Don.*

Mimosa biglobosa, Barb.

A tree of Assam and Sylhet, wood not known.—*Voigt.*

PARKINSONIA ACULEATA, *Linm.; DC.; W. & A.*

Barbadoes flower fence, Exc. | Vilasti kilar, HIND.
Jerusalem thorn, Adanti,
Genet epineux, Pa. | Sima jiluga, TEL.

A small graceful tree, with large yellow flowers, of the West Indies and South America, domesticated in India. It grows 12 or 15 feet high and is seen everywhere in hedges of the Peninsula, springing up with less care than any other tree, is valuable for hedges, and furnishing abundant cuttings for fuel. A useful fibre is obtained from its stem, valuable as a paper material. It is very generally employed in hot climates as an ornamental plant, and especially for the construction of hedges, for which its strong spines render it well adapted. It has long pinnated leaves, with a winged petiole, and grows as much as 12 or 15 feet high. The flowers are large, yellow, very numerous, and a little variegated with red spots and are succeeded by long narrow knotted pods. It grows readily from seed, and is well adapted for hedge rows, the stem from which the leaves spring is capable of being converted into a white fibre. Some of it was sent to the Exhibi-

tion of 1851, as a material for paper-making, and which could probably be afforded at a cheap rate, from the cuttings of the shoots of this plant. It, however, has been considered as wanting in strength. It might, nevertheless, be found useful in mixing with other fibrous substances, and beaten up into half-stuff. This plant has spread largely throughout the Punjab, but it is there only a scraggy small tree, and is not much valued by Europeans except for hedges, for which it answers well if sown close and well-cropped, and it needs but little water.—*Voigt*; *Dr. Riddell*; *Eng. Cyc.*; *Royle's Fib. Pl.*, p. 298; *Dr. J. L. Stewart's Punjab Plants*.

Lichens, are useful to man as food and medicinally and after maceration in urine can be employed as dyes, the chief dye plants are the *Lecanora parella* also the purple powder of *L. tartarea*, or Cudbear, from Cuthbert who introduced it: *P. hamatomma*; *Rocella tinctoria* and *R. fuciformis*, furnish the orchil or archill dye called also Orseille des Canaries. The *Borreria asnehi* is a common dye in India. The nutritive properties depend on the presence of an amylaceous substance analogous to glutone, which Berzelius says, exists in the form of pure starch or amylaceous fibre to the amount of 80·8 per cent in *Cetraria islandica*.—*Voigt*.

PARMELIA KAMTSCHADALIS, *Esch.*

Chalchalira, Himalaya.

Charcharita,

| *Ausnehi*, Himalaya.

This lichen is found in the Punjab bazaars, and is probably gathered in the Himalaya. It is used as a dye, and is also officinal, being given as a stimulant to digestion, and on the Yunani system in mania. Honigberger states that it is also administered in disorders of the stomach and womb, and in cases of calculus. It is also said to be used for purifying the blood, and as a bitter tonic and astringent, is used in intermittent fever and hæmorrhage.—*Dr. J. L. Stewart's Punjab plants*, p. 269; *Powell's Hand-book*, Vol. i, p. 384.

PARMIAUN, HIND. *Gymnosporia spinosa*.

PAROP, also Paropami, see Greeks of Asia.

PAROPAMISADÆ, see Bactria, Greeks of Asia.

PAROPAMISAN MOUNTAINS. The tract dependant on the Paropamisan mountains, is inhabited by predatory Tokhees, and, from the character of the inhabitants, one would expect it to be rough and poor; it seems, accordingly, to be composed of hills destitute of water, and perhaps of soil, with valleys too narrow to admit of much cultivation. The inhabitants live in tents, and are supported by their flocks. The Paropamisus west of Afghanistan is now occupied by intrepid and hardy nomades, the Eimak and Hazarah; and Affghans, whether coming from Balk, Kabul, Kandahar or Herat.

never venture into their mountain districts. The Eimak are shiahs and occupy that part of the range nearer Persia and the Caspian, while the Hazarahs (from Hazar-persian, a thousand), are sunnis, and dwell in the mountains adjoining Afghanistan. Mr. Vigne thinks the word Paropamisus is formed from "pahar," a "hill" or "mountain," and which was perhaps the word meant by Mr. Masson, and the other word "pam," a "roof," that is, a flat roof, such is used in the east. Mr. Masson informed him that the Paropamisan range is a good deal broken into mountains, with table-land on their summits. Professor Lassen prefers the reading of Paropanisus, and explains it to be the country upon or along (para) the Nishadha mountains; the Nishadha mountains forming a range in the Pauranik geography of the hindoo, north of the Himalaya. Lassen on the Kings of Bactria;—*Elphinstone's Kingdom of Cabul*, p. 430; *Vigne's A personal Narrative*, pp. 193, 195-6. See Kabul, Koh.

PARAPI, HIND. A grain measure.

PAROS, HEB. Flea.

PARPADAGUM, TAM. *Mollugo cerviana*, Ser.

PARPARAM, *Pentatropis macrophylla*.

PARPATAKAMU, SANS. TEL. *Mollugo cerviana*, Ser., *W. & A.*, 159, also *Mollugo triphylla*, *Lour., W. & A.*, 157.—*R. i.*, 360—*Rheede x*, 26,—Heyne, did not identify it. Wight says it is a medicinal plant with bitter leaves which he names doubtfully *Oldenlandia biflora*. The same name is used in Tamil; and Brown, on the authority of Rottler agrees and assigns it to *Mollugo* (*Pharnaceum*) *cerviana*.

PARRAKEET, a sub-family of birds of the Parrot family or Psittacidae, peculiar to the eastern hemisphere, found in the tropical regions of Africa, Asia and Australia. See Parrots.

PARRA, a genus of tropical birds, belonging to the family Parridae, the sub-family Parrinae, the Jacanas; as under:

Sub-Fam.—Parrinae.

Metopidius indicus, *Latham*, the bronze-winged jacana, all the East Indies.

Hydrophasianus chirurgus, *Scopoli*. The pheasant-tailed jacana, Ceylon, India.

The genus Parra is restricted to birds from South America, but Adams speaks of water-pheasant (*Parra Sinensis*) which was shot on the river near the head of the valley of Kashmir.—*Adams*.

PARRAWAH, BURM. A timber of Amherst, Tavoy and Mergui, of maximum girth 3 cubits and maximum length 22 feet. Abundant all over Tenasserim and Martaban provinces. When seasoned it sinks in water. It is a durable smooth-grained tough wood; used by Burmese for sticks, helms for pickaxes, and hoes, handles of chisels and other tools, &c.

Recommended for helms and handles of tools generally.—*Captain Dance*.

PARROT.

Tota,	HIND.	Chiluka,	TEL.
Killi poolli,	TAM.		

The parrots are arranged by naturalists in the family Psittacidae, belonging to the climbing tribe of birds, and divided into six sub-families as under,

Psittacidae.

Psittacinae, true Parrots.

Loriinae, Lories.

Palæorninae, Parrakeets.

Platyercinae, Australian Parakeets.

Araina, Macaws of America.

Cacatuinae, cocatoos of Australia and islands.

The sub-family Palæorninae, *Vigors*, and the genus Palæornis are parrakeets, viz. :—

Palæornis alexandri, *Linna.*, all India.

" *torquatus*, *Bodd.*, Tropical Africa, all India, Ceylon.

" *rosa*, *Bodd.*, all India, Burmah.

" *schisticeps*, *Hodgs.*, Himalaya, Bengal, Sylhet, Assam.

" *columboides*, *Vigors*, Malabar Coast, Neilgherries.

javanicus, *Osbeck*, all India to Java.

calthropæ, *Tayard*, Ceylon.

caniceps, *Blyth*, Nicobars, Penang.

erythrogenys, *Blyth*, " Andamans.

longicauda ——— ? *Suinatra*, Malayana.

modestus, *Fraser* ——— ?

viridimystax, *Blyth* ——— ?

Adams mentions the plum-headed and rose-ringed Parrakeets (*P. cyanocephalus* and *P. torquatus*.) The parrakeets are of a green colour with yellow and red markings.

Loriinae or Lories.

Lorilucus vernalis, *Sparrm.*, the love-bird or Indian

Lorikeet of Malabar the sub-Himalaya, Bengal, Sylhet and Burmah.

" *galgulus* ——— ? *Malay peninsula*.

" *asiaticus* or *Indicus* ——— ? *Ceylon*.

PARROTTIA JACQUEMONTIANA, DUC.

Wych hazel,	ENG.	Killar,	RAVI.
Killar; Kirru; Pare,	CHMN.	Sha,	SUTLEJ.
Psher; Pishor,	JHELUM.	Spilecha,	TR.-INDUS.
Pahu; Po,	KANGRA.		

A shrub of some size which grows abundantly in many places on most of the rivers up to the Indus as well as more sparingly beyond it, from 2,800 to 8,000 feet. It is generally seen in clusters and thickets, the stems ranging up to 12 or 15 inches girth, and 15 or 20 feet high. The leaf resembles that of the hazel, for which this plant has frequently been taken by Europeans, although the fruit is very different. In some places its leaves are said to be browsed by cattle. The wood is hard and strong, and makes good pegs, native bedsteads, rice-pattles, walking-sticks, &c., and Vigne states that he had an excellent flute made in England, of its wood. The twigs are used for binding

leaves, making baskets, &c., but the chief use of the plant is for the twig-bridges. These are in most places made of Parrotia twigs, either wholly, or mostly Cotoneaster, Olea and Indigofera heterantha, q. v., being sometimes mixed with these), and in some cases it must be read for the "birch-bark" of travellers. For the bridges, &c., Parrotia is cut at all seasons, and is not very lasting, requiring frequent piece-meal renewal. Longden mentions a birchen jhula at Koksar now replaced by a bridge, and willow is stated to be employed in Spiti, Ladak, &c. Near Mozaffarabad there are several bridges of the same construction, (viz., one longitudinal rope to walk on and two lateral ones to hold by connected with the former by thinner ropes), but made of twisted hide, and one is mentioned by Hutton in Kanawar made of Yak's hair.—*Dr. J. L. Stewart, M.D.*

PARROTIA PERSICA, grows in Persia and Kashmir and furnishes a very hard wood.

PARS, Fars or Farsistan, is a province of the kingdom of Persia which gives its name to the country. It lies between 27° 20' and 31° 42' N. lat., and 49° 20' and 54 E. long., being nearly square and about 220 miles in length and breadth. It has Kirman and Laristan on the east; the Persian Gulf on the south, Khuzistan on the west, and Irak Ajem on the north, with a superficies of about 44,335 geographical square miles, or nearly one-third of France. It has many rich and picturesque tracts, and is less desert than other parts of Persia. The province of Persia contains the salt lakes of Bakhtegan (also called Niriz) and Dereachte, which are in the neighbourhood of Shiraz; and there is a fresh water lake in the plain of Zerdan. The principal streams are the Bendamir or Araxes, which receives the Kur-ab or Cyrus river, as it falls into lake Bakhtegan; and the Nabon, whose course is from Ferozabad southward to the Persian Gulf. In this country are also the higher parts of the two branches of the Tab. Towards the north (according to Mr. Morier), Mader-i-Suliman marks the tomb of Cyrus (son of Cambyzes); and to the west are the ruins of Kizla Safed, and, nearly in the centre, are those of the ancient capital, Persepolis. This territory represents ancient Persia, which was watered by the Araxes, Gyndes, Oroatis, Arasis, Pelevar and Bagrad. Its cities were Corna, Axima, Arbrea, and Artacana; besides many others whose sites are unknown. Persepolis was the capital in the time of Alexander: more anciently the seat of the government was at Persagada, (Strabo lib. xv. p. 729,) the Persagadis of Quintus Curtius (Lib. v. cap. vi.) but as this historian speaks of the fortress of Persepolis, and the city of Persagadis (qu. Farsa-Gerd?) it is possible that the extensive ruins in the

plain, near the former, may be the Parsagada of Pliny. (Lib. vi. cap. xxvi, Euphrates and Tigris, Col. Chesney, p. 210.) Fars or Pars is merely a division of the empire of Iran, is the term applied by Europeans to the whole of that kingdom. It is unknown, in the sense Europeans use it, to the present natives of Iran, though some Asiatic writers contend that Pars formerly meant the whole kingdom.—*Colonel's History of Persia, Vol. i, p. 1; Col. Chesney, Euphrates and Tigris. See Fars, Parsee.*

PARSAJI, see Bhonsla Rajas of Nagpur.

PARSEE, a name given to the Zoroastrians, now scattered through different parts of Asia; but principally located in Bombay and Guzerat. They originally came from Pars or Fars, the province of Persia, known as Persis by the Greeks. The followers of Zoroaster were a part of the great Arian race who left their original country in the high lands of Pamir, at the sources of the Oxus and journeyed westward. While they were still dwelling in Bactria, Zertusht, known to the western world as Zoroaster, reformed their worship. He was a priest of the fire worshippers at a time when the doctrine of a duality of good and evil was already in vogue, though the name of Ahri-man does not occur in the oldest records. What is understood by evil, is evil thought (Ako mano,) or falsehood: and this is contrasted with good thought, which is identical with the good principle, and is now known as Horimazd. An absolute personification of the good principle is, however, hardly to be found in the songs of Zertusht. Zoroasters reform in Bactria, occurred about the time of Menes, or about 3500 B.C. He is altogether distinct from another Zoroaster, the Median conqueror of Babylon, who vanquished the realm and city of the Chaldees, and founded the second Babylonian dynasty in the year 2234 B.C. The worship of fire, and the ordinary receptacle of the sacred fire is called Adran, the more expensive places being called Atash Bahram. They now have a heaven, and the place to which the souls of the good go, is Gurasman Bahasht. They have a hell, called Dozakh, which they describe as a dark place with fire, and where Ahraman, or Shaitan dwells as an arch fiend. They are strict in their ritual observances, particularly those inculcated for purification. The Kusti has frequently to be removed from the person, and their families like those of the Jews, Mahomedans and Christians dwell in rooms apart. They have 10 attributes or names of the deity. Before prayer they wash their hands and feet, take the kusti, pray, and again fasten the kusti. In their prayer, they first invoke Sarozbar, whom they consider to be an angel in heaven. They

men pray to Khorshad, the sun, to an angel named Mahir, (mihir, the sun) and to Hormuzd, the beneficent principle. Women, also, usually pray. The Parsi priests complain that the young men are becoming less strict in their ceremonial observances and are urgent on the elders to enforce them. Their ablutions for purification are much insisted on, after most of the natural functions, and, like the hindoo, the women dwell apart when unwell and similarly for the forty days after child-birth, as followed by the Mosaic and mahomedan ritual. The people are of a yellowish white colour, tall, large made men, with long arms and large feet. Their women are of a pale white, but mostly with a slightly xanthous hue. A new code of laws for the Indian Parsis was promulgated in the middle of the 19th century. In social life, they now can marry only one wife, though formerly, in case of barrenness, a second could be married. The young bride is taken to her husband's house, after she grows up. The women of the Parsi community are believed to be very chaste. They marry in comparative childhood, and this seems to have its usual resulting evils, for the immoralities of the men are constantly before the community in the public papers. The wife and husband call each other by their names. The Parsis do not eat the flesh of the cow or hog, and are permitted the use of spirituous liquors. Their women also use the latter, but they are a sober people, rarely partaking to excess. At their meals, when sitting down they pronounce two words, "Jamwani baz" which they suppose to be a thanks-offering, but the words merely seem to mean "be eating." They neither burn nor inter their dead, on the idea that the earth and fire elements would be made impure by either course. The dying are never allowed to expire on a bed. When near death the sick are removed to the ground and bathed or washed. The reasons given for this removal to the ground are various, but the one ordinarily accepted amongst them is that a dead body is an unclean thing, necessitating that all who touch it must destroy their clothes, and whatever it touches must be destroyed. For these reasons the dead in Bombay are carried by a class of Parsis, called "Nessus salar," Nessus, meaning unclean. These men carry the remains to the dokhma or tower of silence, on the floor of which they lay it. The dokhma has a deep well surrounded by a platform with channels converging to the well. The body is laid on a partition of the platform and the fluids resulting from its decomposition flow along the channels into the well; but after a time the remnants of bones are also swept into that excavation. A small dokhma will cost Rs. 3,000 or Rs. 4,000, when the well is full the bones are removed and burned outside the dokhma. After the demise,

before removal from the house, a dog is brought near to gaze on the departed. This is the Sag-did, or dog gaze, and by one account is said to have been had recourse to, with a view to ascertain from the movements of the dog, the state of the soul of the departed: by another, it is adopted in the belief that the dog is a naturally chaste animal and that the view of the chaste dog falling on the dead will expedite the translation of the soul to heaven. The fire priests are paid to pray for the dead, monthly, for a year, and thereafter on the anniversary of the demise. Addar jasan is the ninth day of the ninth month of the Parsi year. On this day, money is distributed to the priests, and offerings of sandal-wood are made to the sacred flame in their fire temples, which are then much crowded. The educated amongst them are inclined to imagine their Gurusman, or Bahisht, in which Hormuzd dwells, a heaven something like that of the christians, but seven heavens are recognized amongst them: and their dozakh, where dwells Ahriman, or Shaitan, amongst dark fiends, is the equivalent of hell.

In childhood, a Jubhla or silken frock, is worn by the Parsee, both lads and girls, and lads are invested with the Sudra or sacred shirt, and the cord or kusti at the age of six years and three months. It is in reality deemed to be at the seventh year,—the nine months of the child's gestation being included. This investiture is the initiation of the child into the religion of Zoroaster, the silken "Jubhla," being then discontinued. The Sudra is made of cotton cloth, or gauze, or net, while the kusti is a thin woollen cincture or cord of seventy-two threads representing the seventy-two Has or chapters of the Izashme, one of the sacred books of the Parsees. The Sudra and Kusti are worn alike by men and women, but the latter likewise dress in the saree, generally of coloured silk and the short sleeved silk vest called the Kanchri or Choli. Provided the Sudra be worn any other material and of any colour may be added over it. It is to the Kosti, Kusti or Custee, the sacred thread or cord of the Parsees, to which Moore, in his Lalla Rookh, alludes, when he makes Hafiz thus declare himself a Fire worshipper,

Hold! hold! thy words are death,
The stranger cried, as wide he flung
His mantle back, and show'd, beneath,
The Gebr belt that round him hung.

The Kosti or Kusti is terminated by two small tails at each end, denoting the four seasons, three knots on each tail represent in the aggregate the twelve months of the year. Baron de Bode, however, states that the cord is twisted, of 27 threads, such being the number, according to Parsi interpretation, of the known kingdoms of the world at the time of Hushang. The assumption of the Sadaro shirt is part of

the ceremony of initiation. The race the small but intellectual remnant of the once great Median nation are to be found scattered from Hongkong in the east, to Britain in the west. A considerable body of them dwell in Bombay, in Guzerat and the western towns of India. The dokhma is without any roof covering,—is open to the sky, so that birds of prey, vultures, kites, and crows have the freest approach. The raised floor has a deep well surrounded by a platform, with channels converging to the well. The corpse is laid on a partition of the platform, and the decomposing matters flow along the channels into the well. This mode of disposing of the dead is universal among the Parsis whenever they are able to give effect to the arrangements. At Bombay, they place the corpse in an iron chair at the top of a tower, whence, when the birds of prey have devoured the flesh, the skeleton falls into the abyss below. Parsis in China, have been heard to express regret that they lose the privilege of having their remains carried by winged messengers to all the quarters of heaven. What they next appreciate is to be buried with their faces turned towards the rising sun; and Dr. Bowring remarked, inscribed on the Parsi tombs at Macao, the beautiful verses of Ecclesiastes, "Surely the light is sweet, and a pleasant thing it is to behold the sun," &c. He once asked a Parsi why they copied from christians, he said, and very truly, that they had nothing more appropriate in their own. Physicians who attend Parsi patients are always charged (if the cases are likely to terminate fatally) to give timely warning to the friends of the sick man. When it is believed that he is drawing near his end, the attendance of the physician is dispensed with; the dying man is given over to two Parsi attendants who divest him entirely of clothing, and convey him to a chamber on the lowest floor from which all the furniture has been removed, and in which there is nothing but two stones. The dying man is placed upon these stones, held up in a sitting attitude by one of the men, and his body is besmeared with cow's urine. If possible, he must be made to drink some of the same; this is regarded as of great importance, and, under the circumstances, of singular efficacy in fitting his spirit to appear before the Judge of all. After this a quantity of warm water is poured upon the dying man, one vesselful after another, and in the great majority of instances the vital spark is extinguished at this time. In one instance a physician was summoned in all haste. Before he reached the house, however, the friends of the sick man thought him to be on the point of death, and without waiting, removed him to the death-chamber. The doctor arrived, and was told that the patient was dead.

He asked to see him but was denied access. He enquired regarding the symptoms, and on being informed of them, he declared his belief that the man was not dead, and insisted on seeing him. But they would not allow him to approach the body; he might see it from a considerable distance. This ablution with the sacred element is regarded as a means of washing away sin. There is nothing less revolting in the usage than in the exposure of dying hindoos on the banks of the Ganges. We see in both the operation of the same superstition: the idea that the soul is happily dismissed to a better condition by virtue of the application of a reputedly sacred element. How strongly and indignantly have the hindoos been remonstrated with for their barbarous treatment of those whom they love in the very hour preceding dissolution, for the water and mud which they pour down the throat of a mother or father, as the final utterance of filial affection. It is truly remarkable that the analogous usages of the Parsis should have escaped animadversion as they have done. The idea is that this supreme ablution is a necessary passport to heaven, but this idea is inconsistent with the methods of salvation indicated in their sacred books. The Parsis glory in the Zend-Avesta, but there is little connection between Parsiism and the Zend-Avesta.

Although it cannot be doubted that the modern Gabr and Parsi in allowing carcasses to be lacerated and disjointed by birds or beasts, imitate the example of their Magian fore-fathers who (as we learn from classical authority) did not, in general, cover the bones of their dead with earth, until they had been denuded of flesh by carnivorous animals. Some ancient race in the south of Persia, seem to have had urn sepulchres. Amongst the urns found on the plain of Bushire each had a pointed end, and at its mouth a bowl or basin without bottom; not united to the main part by means of agglutination, but very closely fitted, and supported in its place by the general bed of earth. Those urns lay horizontally, not parallel with each other, but on a straight line, and in the direction of East and West. In one urn was a quantity of sand, with the bones of a full-grown person, completely filled, and very heavy. The skull was placed about the middle or widest part; not, in the basin, which contained only sand. Of this urn the greatest circumference was two feet nine inches; its length three feet four inches, including the bowl or basin, which separately, was near eight inches. The urns, made of clay, and about one-third of an inch thick, and solid at the pointed end; but the bowls, without bottoms. The insides had evidently been coated with some bituminous substance; but

the urns nowhere exhibited inscriptions, nor any other mark by which their degree of antiquity might be ascertained.

This sect have, in India, six fire-temples of the first class, or Atash-behram. If India and South Eastern Asia be looked at in their religious aspects, four polytheist faiths will be seen, Buddhism, Brahminism, Sintoism and Shamanism: three monotheistic faiths, Jewish, Christian and Mahomedan; a mixed faith the Sikh, partly monotheistic but believing in incarnations, and lastly the worship of fire as an element by the little numerous but intellectual Parsees. The followers of the various religions in the world, according to Hassel are, in millions.

Christians, millions.	120	Brahmins, millions.	111
Jews, nearly, "	4	Buddhists, "	315
Mahomedans, "	250		

The Persian word Gab'r, a fire worshipper, means any non-believer in mahomedanism. According to the manuscript dictionary, *Burlan-i-Kattea*, Gab'r is used in the sense of Magh, which signifies a "Fire-worshipper." Gab'r mani-i-Magh bashad, keh atash purust ast. This is sometimes written, and very often pronounced Gavr, by a change of letters frequent in Persian, as in other languages. "Gavr," we learn from the dictionary *Jehangiri* means "those fire-worshippers who observe the religion of Zar-dusht, (or Zoroaster), and they are also called 'Mugh.' But Origen, in the third century, defending Christianity against Celsus, an Epicurean, who had alluded to the mysteries of Mithra, uses Kabir as equivalent to Persians. "Let Celsus know," says he "that our prophets have not borrowed anything from the Persians or Kabirs." (*Orig. contr. Cels. Lib., Vol. vi, p. 291. Cantab, 1658.*) A Jewish writer, quoted by Hyde, (*Hist. Relig. Vet. Pers. Cap. xxix.*) declares that the Persians call their priests (in the plural) Chaberin, (or Khabin) whilst the singular Chaber or Khaber, (occurring in the Talmud,) is explained by Hebrew commentators, as signifying Parsai, or Persians. On this subject Hadrian Reland has offered some remarks, in *Dissert ix, de Persicis Talmudicis.* (See his "*Dissert. Miscell. Part ii, p. 297.*" *Trajan ad Rhen. 1706.*) Dr. Hyde, however, as above cited, thinks that Chaber or Chaver, denoted both a priest and a layman. Meninski says "Ignicola, magus infidelis, quivis paganus." The word is more familiar to the people of Europe under the same aspect of Guebre. A small remnant of this race exists in Persia, chiefly at Yezd, in Khorasan. Being persecuted and annoyed by the mahomedans, most of their countrymen have emigrated to India, where, especially at Bombay, they flourish under the name of Parsee. Parsi festivals are celebrated with but little show. Their day is divided into

watches termed gah, of which there are four in winter and five in summer. Each gah has a heavenly watcher and its own special prayers. Pateti, Naoroz or New year's day, is held on the 1st of Farvardin, celebrated in honour of Yezdejird, the last king of the Sassanian dynasty. On this day alms are given and congratulatory visits paid in which the Hama-i-jor or hand-joining is practised. Rapiwar on the 3rd of Farvardin is in memory of Ardi-behisht. Khordad Sal in memory of Zoroaster, who, they variously say, was born B. C. 638, 520 and 389 at Roh in northern Persia. Amardat Sal, is on the 7th, and Farvardin on the 19th of Farvardin; Ardi-behisht; Mediozeren, or midsummer; Khordad Jasan, Medioshamor midwinter, Jasan, Amardat Jasan, Shahrivar Jasan, Petisham Nao roz: Meher Jasan, Firuhrem Aban Jasan, Adar Jasan, Farvardin Jasan, Afshandiyar Muktar, Maharaspaud Jasan, and Hamashpatmadan are other festivals.

In 1861, at the 11th meeting of the Bombay Literary and Philosophical Society, Professor Dadabhai Naoroji gave a short sketch of the present condition of the priesthood, whom, he described as a body, not only ignorant of the duties and objects of their own profession, but entirely uneducated. They only know how to read and write, as that is necessary to the preparation by rote of a number of recitations and prayers required for their daily avocations. On account of this general ignorance among the priests, there is no pulpit among the Parsees. The religious education of the Parsee child consists only in the preparation by rote of a certain number of prayers in Zend, without understanding a word of it. Of late some effort has been made to supply this want. A dialogue is composed, which gives a general outline of the doctrines and morality of the Zaratosht religion, as believed by the present Parsees. The creed taught in it is summed up as follows:—To know God as one—to know the prophet, the exalted Zaratosht, as his true prophet—to believe the religion of the Avesta, brought by him from God, as true beyond all manner of doubt—to believe in the goodness of God—not to disobey any of the commands of the Mazdashna religion—to shun evil and wickedness—to strive for good deeds—to pray five times in the day—to believe in the reckoning and justice on the fourth morning after death—to hope for heaven and to fear hell—to consider the day of general resurrection and judgment as certain—to remember always that God has done what he willed, and shall do what he wills—to turn the face to some luminous object while worshipping God. God is the creator of all things. Deeds shall determine reward or punishment after death, and none but God alone will

and can save. But in order to give an outline of the creed as it really is taught in the original Zend Avesta, which the Parsees believe to be the religious books given to them by Zaratosht, Professor Dadabhai gave a series of extracts from the Zazshne. One of these was, O great judge Hormuzd, full of glory and brightness, I invoke thee, the highest, the all-virtuous, the greatest, the strictest, the allwise, of the purest nature; the holiest, the lover of gladness, the invisible among the invisible, the increaser; He created our souls, He moulded our body, He gave us existence, the eternal, the omnipotent, the creator of all things, Him I invoke, and complete this Yazashne. Good conscience, high piety, love of excellence, high and perfect thought, Khurdad and Amardad (two angels) I invoke." Then are invoked all the angels, the sheep and their souls, the days, months, years, the feasts of the season, the fire, the sun, the moon, the elements, nature, and all creation, and the spirits of all the different departments of creation. The souls of holy and prayerful men and women, everything that is holy and good; the soul of the prophet; his own soul, (of the person praying), each and all being described as created by God. "If I have by thought, word, or deed, intentionally or unintentionally, not kept Thy commands, and thereby saddened Thee, I invoke Thee in this invocation, I pray to Thee, and praise Thee, and beseech Thy pardon." "May I receive the reward for piety through your bounty. May the aspirations of the holy be fulfilled. May the wicked and evil-doers be disappointed, and be swept away from the creation of the Holy Creator." "Hom," an angel, is addressed by Zaratosht as destroyer of death, and is prayed for assisting in destroying all that is wicked, and to bestow the power of doing good. "I am of the religion of the worship of God. I praise that religion, and declare it before the wicked, and praise it with good conscience, good words, and good deeds." "Tell me, O God, the creator and promoter of all creation, what were Thy words before the existence of the heavens, before the waters, before the world, before the sheep and other animals, before the glorious fire created by Thee, before the holy man, before the wicked spirits of dull and perverted reason, before all Thy creation? God replied, O Zaratosht, those words were the parts of Honwar; those that I have told you, those were the words before the heavens, before the waters, before, &c. (The Honwar refer to the holy books of the Zaratoshtee religion.) "Whoever shall study and meditate much upon the words of the Honwar, and recollect them, and act according to them, after death shall attain to everlasting exaltation." "Whoever tastes the pleasure

of righteousness, which is above all other pleasures, and walks in righteousness, shall be perfectly holy." The righteous are immortal." "He who knows God through his works, reaches him." "On the great day of judgment, wickedness and evil shall be destroyed. To speak true words is true sovereignty. The wicked are punished according to their thoughts, words, and deeds. Better is it that they be introduced to wisdom. O Hormuzd, give them a desire for wisdom, that they may become the promoters of holiness. O Hormuzd, I worship thee, and in the heavens, also, shall I worship thee much. For holiness and purity, I ask the aid of Ardebehisht, (angel of fire;) for pure thoughts I ask the aid of Bahanan; I worship thee, O Hormuzd, above all others, I invoke thee above all others, all holy thoughts, all holy words, all holy deeds flow from thee, O Hormuzd, I invoke thy pure nature above all others. Who is the creator and promoter of holiness? How have the revolutions of the sun and moon been created? How does the moon wax and wane? Who has made the earth stand unsupported? Who has created the waters and the trees, the air which flows of itself with such force? Who has created the receiving of light and of darkness? Who has created the times of the day, and the last day of judgment? Who has created the desire to be exalted through virtuous thoughts? Who has created the affection that the child receives from the parent? Thou art the promoter of all goodness. Thou art the creator of all creation. May all men and women of the world become thy followers. I invoke the benefit and success of prayer. To arrive at prayer is to arrive at a perfect conscience. The good seed of prayer is virtuous thoughts, virtuous words, and virtuous deeds. May I love prayer to Hormuzd, for that prayer is joy to me. Prayer to thee, Hormuzd, is the giver of excellence, holiness, success, and high exaltation. May the fold (of sheep) of the people not diminish, may virtue not diminish, may the strength of the holy men not diminish. In this house may obedience prevail over disobedience, peace over quarrel, charity over miseliness, good thoughts over bad thoughts, truth over words of lie, piety over sin. I enjoy holiness on earth and in heaven. That to pray much to Hormuzd is good, I enjoy in heaven and on earth. The author then mentioned that the chapters xi, xii, xv, and xviii of Leviticus describe very nearly some of the present practices of the Parsis, with the exception of the sacrifices, the circumcision, uncleanness until even, and threescore and ten days for purification after the birth of a daughter. Marriage among cousins is recommended. The Parsis are monogamists. Priestcraft, acting

upon ignorance, has not failed to do its work, and has left a legacy of a few works for which the Parsi has no reason to be thankful. Many ceremonies have been thus introduced, but the reformers contend that all those ceremonies that have no authority in the original Zend Avesta ought to be abolished. Of course, the old and the priests do not like this at all. A handful of persecuted exiles, living in a foreign land, surrounded for 1,200 years by idolatry, and persecuted at times by religious fanaticism, the Parsees have still preserved their national type and character, and their original worship. Though they have not altogether escaped contamination and have adopted many superstitious ceremonies and notions of the hindoos, they have always recoiled from degenerating to the worship of idols, and have clung tenaciously to the idea that they were worshippers of only the invisible Hormuzd, the great God. From the extracts it will appear that the Parsees believe in the existence of angels, created by God, and having the power given them to assist and benefit mankind. But they centre their prayers and their hopes, above all, in Hormuzd. Their whole morality is comprised in three words,—Pure thought, word, and deed; their reward and punishment depends upon their fulfilment of this injunction, and their pardon on the will and mercy of God. An evil principle is recognised? but eventually will be annihilated, or, as suggested by Dr. Ihne, converted. Whether, however, Ahriman was a self-created power, or an apostate angel, was doubtful. A French work, by M. Menant, containing an excellent digest of the Parsi Creed, describes it briefly as follows:—"There is one God, He is eternal, there was nothing before Him, and all things are by Him. The universe was truly created by Him, and is not an emanation from Him, but, from creation, has been distinct from the Creator. Creation is composed of spirits and matter. Matter is inert, but spirits are capable of morality. The world of spirits is double. Hormuzd is chief of the spirits of good for eternity. Ahriman is chief of the spirits of evil only for time which passes. Both were created by the eternal, and will endure for the eternity which follows. Souls are all sisters from the beginning, deprived of the body at death, to find it against the hour of resurrection, then never to be separated from it again; they were eternally pre-existent. The guilty will be punished, the just rewarded—both by God. Punishment will only last so long as the principle of evil (Ahriman) endures. The Zend authority is from God, and dogmatic. Hormuzd established religion for all mankind, and not for some only. It will be

one day preferred by all mankind, and thus be universal, both as to time and space." This creed, it is, however, to be observed, is derived from the sacred books, and not from the present belief of the Parsis. But the Zend Avesta also contains much more of an apparently fabulous nature.

There is a remarkable similarity traceable between all the religions existing before the Christian era, which, may arise from the fact that all those religions, excepting the Jewish, were originally of a purely astronomical origin, the heavenly bodies received his first and earliest worship; and the religion of Zartosht was derived from the prevailing forms of worship. At a very early period the origin of evil was a question which agitated mankind. Whence good comes, says one, we know—but whence is evil? It cannot come from heaven. Arnobius, the African, a writer of the third century, refers to this dilemma, "Either the deity is the author of good, or it exists in spite of him;" for it is not possible (thought Plutarch) that the same being, whether good or bad, can be the author of both. Hence arose the necessity of supposing two principles always opposing one another. These principles were early associated with physical phenomena. Light was good—darkness, evil; summer was the distributor of benefits which winter was always undoing and destroying. But it was the Sun which produced light, and covered the earth with verdure in summer, and his absence which bound it up in winter; and thus this luminary became early personified as the great principle of good, and his struggles and alternate mastery over, and conquest by, the evil principle, were symbolically described in the battles of the gods and giants—of Ouranos and Typhon, of Osiris and Typhon, of Hormuzd and Ahriman. The very name of Hormuzd signifies, according to the best authorities, the great principle of light; and the astronomical character of the early Persian fables may be illustrated by one incorporated in the Zend Avesta. Hormuzd made six deities, which represented virtues; whereupon Ahriman made six of a malevolent nature. Hormuzd raised himself three times higher than his wont, and decorated the heavens with stars, appointing Sirius sentinel over them. Again, Hormuzd created twenty-four gods, which (says the fable) he enclosed in an egg. Ahriman did the same, and these broke the first egg, and thus good and evil became intermixed. Now, all this evidently relates to the constellations—the six good deities were symbolical of the six zodiacal signs, between the vernal and autumnal equinoxes, when the sun was in power. The six evil ones were, of course, the six winter signs. Hormuzd raising himself three times his height above the earth, meant

his elevation above the spheres of Mars, Jupiter and Saturn, which would bring him to the pure ether—the region of the stars. The twenty-four gods were the twenty-four northern constellations, six zodiacal and eighteen extra zodiacal, for before Hevelius formed constellations from the stellæ informes there were but eighteen constellations in either hemisphere. And the twenty-four gods of Ahriman were, of course, the remaining twenty-four southern or winter constellations. The equinoxes showed the term of duration of power of these great opposing principles; and whether we regarded the Persian statutes of the bull (Taurus, the vernal equinox) being destroyed by the scorpion, (scorpio, the autumnal equinox,) or the fable of Jupiter (the sun of summer) losing his thunderbolt (power, vigour) in winter, as related in the Dionysiac of Nonnus, the meaning is the same. The sun was personified with different attributes, according to his position in the zodiac. The vernal sun was the beardless youthful Apollo, the autumnal, the bearded, aged Æsculapius, son of Apollo, with a serpent twisted round his staff or even round himself. This serpent was the great serpent of the heavens which stretched its length beside the three autumnal constellations of Libra, Scorpio, and Sagittarius, and into whose folds the sun appeared to descend in autumn. Hence the explanation of the well-known mythical hindoo figures of Vishnu, conquered, (in autumn,) enveloped in the folds of the serpent, and triumphant, (in spring,) with the serpent raised aloft in his arms. And thus we can understand the enigma uttered by the oracle of Apollo at Claros, in Ionia, which said, "I am Jupiter Ammon in spring, and black Pluto in winter." Dr. Ihne, however, said the astronomical explanation might be very well applicable to the religion which prevailed before Zoroaster as it was to other ancient religions, but that introduced by him was entirely spiritual and moral—that he may have retained some of the institutions of the old faith, but the peculiar characteristic of the Zoroastrian faith was its spirituality and high morality, as must have been seen from the extracts read.

The Parsees are at present, to some extent, fatalists; but this was one of the corruptions which had crept in through their intercourse with the hindoos. They were monogamous; and their sacred books do not degrade woman below man, though it was only lately that their women had been allowed to mix in society. With regard to the worship of fire, which was brought against them, they regarded fire as the purest and best symbol of the Deity, and that one of His works which could be most conveniently isolated and circumscribed; hence they had sacred fires in the temples, towards

which they turned when addressing their prayers, not to it, but to the god of which it was the symbol. The injunction is to turn their face to anything that is glorious, as the sea, the sun, &c. They would not abuse fire, nor extinguish it unnecessarily, nor use it in a contemptuous manner. Hence, the Parsee do not smoke. Gaomaezo or nirang is the urine of the cow, ox or she goat, and the second act of a Parsee, after rising from his bed and before touching anything with his hands is to rub it over the face and hands, after which he purifies himself by having water poured on his hands and feet. Women after child-birth have to drink a little nirang and are purified with it similarly. This process is laid down and enjoined as a purification rite in the 9th Fargard of the Vendidad (page 120, line 21 in Berghaus edition.) The reforming Parsees object to its use. A pious Parsi has to pray about 16 times a day. They pray in the Zend language, which none of them understand. They pray on getting out of bed, after using the nirang, after bathing, after cleaning the teeth, after finishing the morning ablutions, after the ordinary natural functions, after washing the hands. Every one of the three meals begins and ends with prayer, besides the grace, and before going to bed, the day is closed with prayer. Amongst the Parsees, there is no pulpit, or pulpit orations in the vernacular of the people. Ordinarily every one goes to the fire temple whenever he likes, recites his prayers himself, and as long as he likes, gives, if so inclined, something to the priests to pray for him. On several occasions as in the occurrence of the Ghumbar, the bimestral holidays, there are assemblages in the temple and prayers are then repeated in which few or more join. The priests are the most bigoted and superstitious and exercise much injurious influence, especially over the women. Perhaps only a dozen of professional priests lay claim to a knowledge of the Zend-Avesta, to the extent of reading with meaning, the books they have been taught Parsis have one wife. They do not eat beef, pork or ham and do not eat food cooked by a person of another religion. The high priest is called Dustoor; the other priests are styled Mobed, and the priesthood is hereditary. They object to be called fire-worshippers, and claim never to address any unintelligent material object. They acknowledge to feel awe with regard to light and fire; they do not smoke and object to blow out a candle. There is, however, hardly a Parsee, man or woman, who can give an account of the faith that is in them. The Yasna, Vispered and Vendidad are their sacred writings. But they have not been translated into a vernacular, and each Parsee has to pick up his religion as best he may.

The form of marriage among the Parsees is a very simple ceremony, little more, indeed, than a civil contract, ratified by family consent, and abundant festivity. The rite performed by the priest, consists in placing the hands of the bride flat against that of the bridegroom, and binding their united wrists with a double thread of crimson worsted. Being severed, the cincture is secured on the wrist of each, where it remains for a period of eight days, the threads are then unbound, and cast into the water. The gift of loveliness is not alone bestowed upon the higher classes of Parsee women; but, "when the daughters of the men of the city come out to draw water," the Parsee maidens may frequently be remarked for their handsome countenances, and dignified, yet feminine deportment.

The ancient Persians reckoned a new era from the accession of each successive monarch, and as Yezdijird had no successor, the date of his accession to the throne, 16th June A.D. 632, has been brought down to the present time, thus making the year A.D. 1867, their year 1235-36. In their calculations only 365 days are allowed to the year; leap year is unknown to them, though it is alleged that in every 120 years one month was added to make it correspond with the solar year. The year is divided into twelve months of thirty days each, and five days, or "Gatha," as they are called, are added at the end to make up the deficiency. The months are,—

1 Farvardin.	4 Tir.	7 Meher.	10 Doh.
2 Ardibehisht.	5 Amardad.	8 Aban.	11 Bahman.
3 Khurdad.	6 Sharivar.	9 Adar.	12 Asfandiyar
Gatha 5 days.			

The Parsees do not now divide their time into weeks, but name the 30 days of their months each after a celestial being—7 Amshaspand and 23 Izad—supposed to preside over them. These are as follow :—

Gujarati.	Pehlvi.
1 Hormazd.	Anhuma.
2 Bahman.	Vahuman.
3 Ardibehisht.	Antavahisht.
4 Sharivar.	Shatnavin.
5 Spandarmad.	Sapandamad.
6 Kurdad.	Khundad.
7 Amardad.	Amandad.
8 Dep-Adar.	Dini pavan Atun.
9 Adar.	Atun.
10 Awan or A'ban.	Avan.
11 Khurshid.	Khur.
12 Mohar of Mah.	Maha.
13 Tir.	Tir, or Tistar.
14 Gosh.	Gosh.
15 Dep-meher.	Dini pavan Matun.
16 Meher.	Matun.
17 Serosh.	Sarush.
18 Rashne.	Rashan.
19 Farvardin.	Farvardin.
20 Behram.	Varahram.
21 Ram.	Ram.
22 Guvad or Bad.	Wad, or Vat.
23 Dep Din.	Dini pavan Din.
24 Din.	Din.
25 Ashashang.	Arđ.

26 Ashtad.	Ashtad.
27 Asman.	Asman.
28 Zamiad.	Zamiad.
29 Mahaspand.	Mansar-spand.
30 Aniran.	Aniran.

The 1st, 8th, 15th and 23rd days are sacred to Hormazd, and thus afford evidence of an older division into weeks.

The Parsees of India are divided into two sects,—the "Shahanshahi" or "Rasami," and the "Kadimi" or "Churigarian," the former of whom constitute the larger portion of the race. This division originated about the beginning of the 18th century, when a Persian priest, named Jamasp, arrived in India, and found that his co-religionists differed from their brethren of Iran in their calculation of time by a full month, and in other minor points relating to their "liturgy." Serious disputes arose in consequence, which ended in the formation of the two sects,—the Rasami adhering to their own views, and the Kadimi adopting the opinions imported by Jamasp—and thus agreeing with their Persian brethren. The difference lies in their computation of time, and in some slight variations in the forms of prayer. Those that begin their year a month earlier are styled Kadimi, and the rest Rasami, i. e., 'customary,' and Shaharshahi, for which some one proposed to substitute Shahanshahi ('of the kings of kings,') and this absurd change has ever since been adopted. The Kadimi Parsee Era of Yezdijird, or Dureai Naoroz, or sea-reckoning is made use of in nautical calculations among Asiatic mariners, and the New Year always commences on the 1st of Farvardin, which falls about the 25th of August, one month earlier than the commencement of the Rasami New Year. With the Rasami Parsees, the New Year begins on the 1st day of Farvardin, which in A.D. 1867, fell about the 24th of September, a month later than the commencement of the Kadimi New Year.

About A.D. 1705 Jelaledin Malikshah, finding that the commencement of this year in Persia had anticipated the epoch by 112 days, ordered that, in future, the Persian year should receive an additional day whenever it should be necessary to postpone the commencement of the following year, in order that it might occur on the day of the sun's passing the same point of the ecliptic. U'mar Cheyam, one of the astronomers appointed by him to construct a calendar, is said to have discovered that 8 intercalations in 33 years very nearly adjusts the calendar, giving the length of the year 365d. 5h. 49m. 5.65s. Scaliger and others say this was the period actually adopted, though Delambre shows that the Persian intercalation combines the two periods of 29 years with 7 intercalations and of 33 years with 8 intercalations.

Amshashpand: in the existing Parsee religion seven Amshashpand are supposed to exist, they are called the immortal holy ones. These cannot be regarded as the elements.

The **Ardibehest-Jasan** festival, is maintained in honour of Ardibehest Amsaspund, the controlling angel, according to their theology, over their sacred fire; on this day the Parsis crowd their fire-temples to offer up prayers to the Supreme Being.

The **Ava Ardui Sur Jasan** festival, is held in honour of Ava, the angel, in their theology, who presides over the sea. On this day, Parsis should approach the sea-shore or any stream of water and chant prayers from the Zend, but these people now generally mix with their prayer several hindoo rites such as offering flowers, sugar, cocoanuts, &c., &c. In Bombay a fair is held on the esplanade on this day.

The **Amardad-Sal** holiday, is held on the day following the Khurdad-sal of which festival it is merely a continuation.

Amardad is from Ameretat, immortality, the seventh Amshashpan of the Parsee.

There is a new Parsee sect known by the name of "Shapoos," who pay great respect to foreigners, with the exception of Mahomedans, whom they treat with contempt. These people, like the Zoroastrians, pray while standing looking to the sun and near water. They never talk with anybody barc-head," &c. The admission of an individual into the Parsee faith is indicated by the assumption of the Sadara, or shirt.—*Lieut.-Colonel Stuart's Journal of a Residence in Northern Persia*, p. 171; *Elliot's Supp. Gloss.*; *Onseley's Travels*, Vol. i, pp. 150, 217-219; *Postan's Western India*, Vol. i, pp. 110, 120; *Max Muller, Chips from a German Workshop*, p. 180; *Professor Dadabhai Naoroji and Dr. Ihne, in Proc. PARSHAWARSHA, HIND. *Adiantum*.

PARSI, HIND.? A tree of Chota-Nagpore, with hard red timber.—*Cal. Cat. Ec.* 1862.

PARSI BADAMA, TEL. *Amygdalus communis*, *Linn.*

PARSI KUNJAM KORAY, TAM. Balm, *Melissa officinalis*, *Var.*

PARSI VADOM-COTTI, TAM., and *Parsi vadom-vittulu*, TEL. *Amygdalus communis*.

PARSIVAN, literally, speakers of Persian, a term applied by the Persians to the Persian speaking part of the Teimeni tribe of the Char Aimak. The Parsivan and Eimak who are

subject to the Affghan, profess mahomedanism. The Parsivan live in towns, and the Simal are nomades and live in tents. Their number is double that of the Affghans.—*Ed. Ferries Journ.*, p. 158. See *Affghanistan*, Kabul, Kandahar.

PARSLEY, *Apium petroselinum*, a well known seasoning herb, used in soups, garnishing, &c., grows well during the cold months, requires a free rich soil, and planted on a bed raised 6 inches above the surface level, raised from seed. Is cultivated from seed: may be sown in beds or rows, where it is to remain. The plants, when about two or three inches high, should be thinned, and a space of at least a foot left between each. It will, if watered and taken care of, continue all the year round. A good plan is occasionally to cut down the leaves to within four inches of the root, as it makes the parsley throw out young and fresh leaves. It bears transplanting well. Always give the preference to Europe seed. The common parsley of the country is very insipid. The roots of parsley are much used in French cookery.—*Jaffrey*.

PARSNIP. Hu lo p'u, CHIN., is a vegetable very difficult to rear, as it does not often happen that the seeds come up; they should be sown broadcast in beds of a rich soil, and the plants, when of a sufficient size, carefully thinned, leaving a space of one foot between each plant and removing all weeds. They may be transplanted, but it must be done with the same care as recommended for beet-root. The proper time for sowing the seed is the latter end of July, and they will come in during March and April. It goes to seed freely, but the roots grown from it were by no means fine the second year.—*Jaffrey*.

PARSOJI, see Mahratta Governments.

PARSOK-TSHI. LEP. *Gallus ferruginous*, *Gmel.*

PARSONS, Abraham, Esquire, author of a voyage from Bombay to Mokha and Suez; Lond. 1808.

5 Orodes	II	Persia, 1st of the		
5 Vonones	I	Sassanidæ.		
13 Artabanus	III			

The family name Arsaces was that applied to all the kings of Parthia, hence called the Arsacidæ. Very inaccurate ideas prevail, concerning the local situation of Parthia, by those, whose knowledge of it, is collected chiefly from its wars with the Romans. Parthia proper, was a small province, very near to the south-east extreme of the Caspian sea, which territory, after the division of Alexander's empire, fell to the share of the Seleucidæ, kings of Syria and of the east, about 300 years before the christian era. About 50 years after, Parthia rebelled, and, together with Hyrcania, and other adjoining provinces, became an independent state, under Arsaces. As the empire of the Seleucidæ grew weaker, the Parthians extended their country westward; and the fine province of Media (now Irak-i-Ajam) fell to them: and within a century after the foundation of their state, it had swallowed up all the countries from the Indus to the Euphrates, Bactria included, and this province had thrown off the yoke of the Seleucidæ, long before Parthia. The Parthian conquests in Armenia, 70 years before Christ, brought them acquainted with the Romans; whose conquests met theirs, both in that country and in Syria. The Parthians, together with their conquests, had advanced their capital westwards and had established it on the Tigris at Seleucia, or rather Ctesiphon (near the present Bagdad) before their wars with the Romans commenced. Their first wars with the Roman people, continued about 65 years, and were noted by the expeditions of Pompey and Anthony, and the defeat of Crassus. On occasion of this last event, the Parthians extended their conquests further westward, but were afterwards compelled to retire: and they generally lost ground in Armenia and Mesopotamia, during the time of the Roman

emperors. Trajan penetrated to their capital; and satisfied his curiosity by embarking on the Indian sea. The moderation of Adrian restored the ancient boundary of the Euphrates. In A. D. 245, Persia, or Persia proper, which had for some ages ranked as a province of Parthia, gained the ascendancy; and, under Artaxerxes, put an end to the dynasty of the Arsacidæ; and restored the ancient name of Persia to the empire, after that of Parthia had existed about 480 years. So that, in fact, the Parthian empire, considered generally, was the Persian, under another name. In 256 or 252 B. C., Bactria had declared for independence under Theodotus or Deodotus. Parthia followed about the year 250 B. C., under the rule of Arsaces, who is variously described as a native of Soghd, as a Bactrian, and by Moses of Chorene, as of Balkh, this last author adding that the dynasty was known as Balkhavenses or Pahlavian. He used Greek only on his coins and in his public letters and correspondence. His coinage is ordinarily with the head of the sovereign on one side and only one coin has a lingual inscription. Great king of kings was a title first adopted by Mithridates II. Foster deems the practice of the Parthian horsemen of shooting arrows from on horseback, as a confirmation of their descent from the warriors of Tartary: but the usage is, and always has been, as common to Persian as to Tartar tribes. The Parthians, built Ctesiphon out of the ruins of Babylon. Parthians, Getes, Huns or Kathi, or a mixture of these seem to have overthrown Balabhipoora A. D. 524. But Thomas' Prinsep gives A. D. 745. In the genealogy of the Lunar races descended of Budha and Ella (Mercury and the Earth,) the five sons of Baj-aswa are made to people the countries on and beyond the Indus; and in the scanty records of Alexander's invasion, mention is made of many races, as the Asasenæ and Asacani, still dwelling in these regions. This period was fruitful in change to the old established dynasties of the hindoo continent, when numerous races of barbarians, viz.: Huns, Parthians, and Getes, had fixed colonies on her western and northern frontiers. —*Prinsep's Antiquities by Thomas, Vol. ii, p. 176; Rennell's Memoir, p. 200-1; Malcolm's History of Persia, Vol. i, p. 88; Tod's Rajasthan, Vol. ii, p. 5.* See Aquicula, Greeks of Asia, Hindoo, Koh, Kabul, Saurashtra.

PARTHO-SCYTHIAN, see Kabul.

PARTHIVI, see Prithivi.

PARTI-VITTULU, TEL. Cotton seeds.

PARTRIDGE. This family of birds belongs to the grouse and partridge family, the Tetraonidæ and the sub-family Perdiciinæ. The chief species of partridges, in the East Indies, are as under:—

Lerwa nivicola, *Hodgs.*, Snow partridge: Himalaya.

- Francolinus vulgaris*, *Stephens*, Black partridge, North India.
 " *pictus*, *Jerdon*, *Selby*, Painted partridge, Central and Southern India.
 " *phayreii*, *Blyth*, North Burmah.
 " *pintadensis*, — ?
Caccabis chukor, *Gray*, Chukor partridge, Western Himalaya.
 " *græca*, — ? Western Asia, South Europe, North Africa.
Ammoperdix bonhami, *Gray*, Seesee partridge, Panjab.
 " *hayi*, *Gould*, Arabia, Palestine, Western Asia.
Ortygornis ponticerianus, *Gmelin*, Gray partridge, South India.
 " *gularis*, *Temm*, Kyah partridge, Bengal.
Rhizothera lengirostris, *Temm*, Malayana.
Arboricola torquæola, *Vigors*, Black-throated Hill partridge, Himalaya.
 " *rufogularis*, *Blyth*, Rufous-throated Hill partridge.
 " *atrogularis*, *Blyth*, Tipperah, Chittagong.
 " *intermedia*, *Blyth*, Arrakan.
 " *brunneo-pictus*, — ? Tickell, Tenasserim.
 " *sphenura*, — ? China.
Perdix personata *Horsf.*, Java.
 " *javanica*, *Gmelin*, Java.
 " *hodgsoniæ*, *Gould*, — ?
 " *punctulata*, *Gray*.
 " *charltoni*, — ?
 " *chloropus*, *Blyth*.
Rollulus coronatus, — Malacca crowned partridge.
 " *niger*, — ?

There are three kinds of partridges in the plains of India, black, painted, and grey, as they are called by the Indian sportsmen. The last-mentioned, the least handsome of the three, and far inferior to the English bird, the most nearly approaches it in appearance. The black excels all for the splendour of its plumage. The call of the black and painted partridge is very similar; both, as well as that of the grey, differing from that of the English bird. In the Bombay presidency the black partridge has not been seen south of Cutch. It is abundant north of it in Sind, but would appear to be replaced by the painted further south. The flesh of all the partridges in India is white, and far inferior to that of either the common English, or red-legged bird. The hen of the black partridge, is quite different in appearance to the male, is not unlike the painted partridge of both sexes, and is sometimes mistaken for it. The difference, however, is easily discerned by the experienced sportsman. The black partridge commences to pair about April in the Himalaya, but earlier in the plains; the young remain with their parents a long time, and are not fit for shooting until the middle or end of October. During the period of incubation the males can be heard answering each other all over the district; the call-note is harsh and composed of four distinct sounds following each other in succession; and not unlike the words: "Whee wha which a which," which it repeats at short intervals when perched on a stone in

bushy places. The Tibet partridge (*P. hodgsonii*) was first discovered by Mr. Wilson of Mussourie in 1841, and subsequently described by Mr. Hodgson. It was, still later, 1854, met with by Lieutenant Smith, 15th regiment, near the Pangong Lake in little Tibet. This partridge seems to be common along the western slopes of the Tibetan Himalaya, and affects barren mountain sides. A white band crosses the forehead, and, passing over the eyebrows, meets the opposite at the occiput. Throat white; black patch at the corners of the lower mandible; breast and belly barred irregularly with black and rufous, the former in greatest abundance on the breast, the latter on the neck and sides of the belly and breast; vent and lower part of the belly dirty-white; the feathers, as usual, are soft and downy; crown rufous; occiput mottled with black and rufous, which is continued over the back and wing-covers, resembling closely the same parts in the Indian grey francolin, whilst the quills of the birds assimilate in appearance with the same parts in the black partridge.—*Adams*.

PARTULA, a genus of molluscs.

PARUA-KALANGA, MALEAL. Aponogeton monastachyon.

PARU-PARISANNA. This name first occurs in the tri-lingual tablets of Darius, where the mountain range of Gandara is termed Paru-Parisanna. Paru merely means a mountain, in Sanscrit. The country is not known by this name, by its inhabitants, who only speak of it by the tribe dwelling in, or the chief who commands it. Ferrier includes in this name, all the mountain country enclosed by the circle formed by Herat, Meimuna, Balkh, Bamian, Ghazni, Kilat, Ghilzi, Kandahar, Zimindavar, and Sahlin. It may be looked upon as a vast natural fortress, thrown on to the centre, and on the culminating point of the great Asiatic table-land. From whatever side, it must be approached by rugged and high mountains, and it is also intersected by others in various directions, particularly east and west. It is a country of incessant change, the Jemshidi, the Hazarah, the Zeidnat and the Taymuni being in constant movement.—*Ferrier's Journal*, p. 254.

PARUS, a genus of birds, the tit-mice, of the sub-family Parinæ, family Ampelidæ, and order Insectores :

- Parus cæmodius*, *Hodgson*, Himalayan Cole-tit.
 " *atkinsoni*, *Jerdon*, Sikhim
 " *monticolus*, *Vigors*, Green-bodied "tit."
 " *cinereus*, *Viollet*, Indian grey tit.
 " *nuchalis*, *Jerdon*, White-winged black tit.
 " *xanthogenys*.
Jerdon, iii, p. 276.

Parus Melanophilus, *Vigors*, is the black crested tit. *P. erythrocephalus*, is the red-capped tit.

Parus Spilonotus, see *Parus subviridis*.

Parus major. ('Great Tit.') Europe, N. Asia, Japan, N. Africa. Replaced in India, Ceylon, and Java, by *P. cinereus*, and in the Himalaya also by *P. monticolus*. If not also *P. nuchalis* (in addition to *cinereus*.)

Parus coruleus. ('Blue Tit.') Europe, N. Asia, Japan, China, Formosa.

Parus ater. ('Cole Tit.') Europe, Siberia, Japan, Formosa. Replaced in Nepal by *P. omodius*.

Parus subviridis, Tickell, *n. s.* Affined to *P. xanthogenys* and *P. spilonotus*; but the whole of the under parts dull yellowish-green, without a trace of black, passing to ashy on the vent and lower tail-coverts; back much the same, but darker with the feathers centred yellow, imparting a mottled appearance: crown and nape black, a few of the posterior long crest-feathers tipped with yellow; feathers at base of bill, the lores, cheeks and sides of neck, supercilia, and mesial nape-streak, bright yellow: wings and tail dull black, the great alars and caudals margined with ashy, and two or three of the primaries with whitish; a conspicuous white patch, also at the base of the primaries; and the tertiaries are tipped on the outer web with an elongate whitish spot, this hue also extending up the inner web of the smallest tertiary, the smallest wing-coverts are tipped with ashy, and the first great range of wing-coverts with white upon both webs, the second range upon the outer web only; forming two cross bands on the wing: the anterior half of the wing is white underneath, but the axillaries are light yellow: the outermost tail-feather has its exterior web dull white, and a spot of the same tipping the inner web; this spot being successively smaller on the penultimate and ante-penultimate tail-feathers: bill black and legs plumbeous; length about $4\frac{1}{2}$ in.; of wing $2\frac{3}{4}$ in.; and tail 2 in.; longest crest-feathers $\frac{5}{8}$ in. species of *Parus* are very uncommon in the Tenasserim forests. In fact, remarks Captain Tickell, "this is the only one I have seen."—*Mr. Blyth's Report*.

Parus xanthogenys, Jerdon, for which Mr. Blyth proposes the name of *P. jerdoni*, *n. s.* It much resembles *P. xanthogenys*, Vigors, of the N. W. Himalaya; but is conspicuous by having the back less tinged with yellow, larger portions of the plumage not so intense in hue, and the yellow sincipital streak is not continued forward over the eye, as in *P. xanthogenys* (verus). Length of wing 3 in.; and of tail $2\frac{3}{8}$ in.; in *P. xanthogenys* the wing varies from $2\frac{1}{2}$ to $2\frac{3}{4}$ in., and the tail measures $2\frac{1}{8}$ in. This is the third species which has now been discriminated apart from *P. xanthogenys*, Vigors; the others being *P. spilonotus*, Blyth, from Nipal,

Sikim, the Khasyas, &c., and *P. subviridis*, Tickell, Blyth, from the mountains.

Mr. Blyth further distinguished *P. rubiventris* of Nipal and Sikim from *P. melanolophus*, Vigors, of the Simla and Masuri mountains; with which the *P. melanolophus* of Jerdon's catalogue still requires to be critically compared.—*Beng. As. Soc., Vol. v, 1856*.

PARU, MALEAL. *Dolichos sinensis*, Linn.

PARUA-KALANGA, MAL. *Aponogeton monostachyon*.

PARUL, MAHR. *Bignonia suaveolens*, Roxb.

PARU MARM, MALEAL and TAM. *Ailantus malabaricus*.

PARUMBE, TAM. *Premna spicigera*, Linn.

PARUNGI, HIND. *Quercus dilatata*, jangli, parungi, is *Q. semecarpifolia*.

PARUNIKI-MAVAH, MAL. *Anacardium occidentale*.—L.

PARUPU KIRE, TAM. *Chenopodium album*. Linn; Roxb.

PARUPU BENDA, TEL. *Abelmoschus ficulneus*, W. & A. 196—W. Ic. 154.

PARUPU VELAGA, or Velaga, TEL. *Feronia elephantum*, Corr. Parupu means "Soft."

PARUSARAMA, see Parasu Rama.

PARUSHAKA, SANS. Fruit of *Elate sylvestris*, Linn.

PARUSHA-MED'HA. Human sacrifices. Certain forms for this sacrifice are prescribed in the Puranas; Mr. Ward, affirmed, that it was generally reported that human sacrifices actually occurred in Bengal, and the Meriah sacrifices, and suttees in India, the head hunting of the Dyaks, and cannibalism of the further archipelago, of the present time, can but be regarded as the continuance of rites which have had a wider range in former ages. See Sacrifice.

PARUSSNOE POLOTNO: also Parussina, Rus. Canvas.

PARUTI, MALEAL. *Paritium tiliaceum*, St. Hil, also *Gossypium indicum*, Lam.

PARVATA, also Parbatya, a hillman, a mountaineer of Nepal, Wils.

PARVATI or Parvati Peak, $31^{\circ} 51' 5"$, $77^{\circ} 42' 0"$, in Kulu-Lahol, near the source of the Parbati, an affluent of the Bias, 20,515 feet, G. T. S. Presents a steep, broad wall, as seen from Jako.—*Schl., Herm.*

PARVATI, generally called Parbatti, a hill of considerable height at the southern end of the city of Poona, on the summit of which is a handsome, but not very elegant, temple in honor of Parvati, consort of Mahadeva. This temple is much resorted to, and when lighted up on great occasions, it shows well, and from its top is a fine view of the city and environs. On the annual hindoo ceremony of Dutchna, or

alms-giving, great sums are given away at Parbatti. To this temple brahmans come to share the loaves and fishes from considerable distances; it would not be worth the pains for the majority to come so far merely for what they get here, but, as a gift on this day tells ten-fold of an ordinary alms, others make presents to some brahmans, so do generous people on the road to and from this meritorious pilgrimage. The whole month is, indeed, very fit for the benefit of hospitality and alms-giving, so that the travelling brahmans are fed, &c., all the way to Poona and home. Some come from Surat, Panderpoor and other more distant places and it is confidently said, that forty thousand have been known to assemble on this occasion at Parbatti.—*Major Moor, pp. 376 to 377.*

PARVATI, SANS. The daughter of Parvata, a mountain in hindoo mythology. Parvati is the wife of Siva, known in her martial character as Durga, or active virtue, and as such she destroyed the Asura, or demon Mahesha, a personification of wickedness. On one occasion, when Vishnu beheld Siva dancing about frantically with the deceased form of Sati, in his arms, he cut it into fifty-one pieces; which Siva, who still continued in his frenzy, scattered in different parts of the earth. These spots he afterwards ordained to be places of worship, to his own and his energy's peculiar emblems. Daksha, who had been slain by Vira Badra, in consequence of the death of Sati, was restored to life, but with the head of a goat, on condition of his adopting the doctrines of Siva. Parvati as the consort of Siva, has maternal claims upon Kartikeya, the leader of the celestial armies, and Ganesha, or Ganaputti, the god of wisdom. They were both produced in a very extraordinary manner, as will be seen in the descriptions of them. Parvati is the goddess of a thousand names, and both her forms and powers are more various and extensive than those of any of the other hindoo deities. She acts sometimes dependent on, at others wholly independent of, her husband, Siva. Her numerous forms are only variations of the more important ones, Bhavani, Devi, Durga, and Kali. As Parvati, she is described of a white, as Kali, of a dark blue or black, and as the majestic and tremendous Durga, of a yellow colour.

Parvati has no particular temples, but her statue has a sanctuary apart, in the temples of Siva. She is worshipped by different names, particularly that of Mera, and, in Bengal, by that of Durga. She seems to be the same as the divinity of Hieropolis, called Rhea; and Cybele in Phrygia. In the temples erected in honour of Siva the officiating brahman, after bathing in the morning, enters the temple and bows to Siva. He anoints the image with clari-

fied butter after which he bathes the image with water which has not been defiled by the touch of a sudra, nor of a brahman who has not performed his ablutions, by pouring water on it, and afterwards wiping it with a napkin. He next grinds some white powder in water, and dipping the ends of his three fore-fingers in it, draws them across the linga, marking it as the worshippers of Siva mark their foreheads. He next sits down before the image, and shutting his eyes, meditates on the work he is commencing; then places rice and doorva grass on the linga; next a flower on his own head, and then on the top of the linga; then another flower on the linga; then others, one by one, repeating prayers: he then places white powder, flowers, vilva leaves, incense, meat offerings, and a lamp before the image; also some rice and a plantain: he next repeats the name Siv, with some forms of praise; and at last prostrates himself before the image.

On the 14th of the increase of the moon in Phalgunu, in the night, a festival in honour of Siva is kept at his temple, the image is bathed four times, and four separate services are performed during the night. Parvati, by the saiva sect is identified with the supreme sakti. Durga, who destroyed more giants than all the rest of the hindoo divinities together, is, under all the numerous names and forms derived therefrom, no other than Parvati, Bhavani, or Devi, the sakti or personified energy of Siva. The argha or yoni in hindoo mythology is Parvati's especial emblem. Anna Purna Devi, a goddess of the hindoo mythology, is a beneficent form of Parvati, she is described as of a deep yellow colour, standing or sitting on the lotus, or water-lily. She has two arms, and in one hand holds a spoon, in the other a dish. In her dress she is decorated like the other modern images of Durga, Anna Purna is a household goddess, and is extensively worshipped by the hindoos. Her name implies the goddess who fills with food, and they believe that a sincere worshipper of her will never want rice. She is possibly the Anna of Babylon and she has been considered as the prototype of the Anna Perenna of the Romans, whom Varro places in the same rank with Pallas and Ceres, and who was deified and held in high esteem by the Roman people, in consequence of having supplied them with food when they retired into Mount Aventine. Besides the great similarity of names, there is a singular coincidence in the times of their worship, the festivals of Anna Purna taking place in the early part of the increase of the moon in the month Choitra (partly in March,) and those of the Roman goddess on the Ides of March. In India, she is known simply as Anna, also as Anna Purna or Anna Devati. In a hymn addressed to her

by the rishi Agastya, she is personified as Pitu or material food. Anna Purna is from the Sanscrit, anna, food, and poorna full. Another name is anna, food, and prashana, feeding. The rajpoot rite of Sati or self-sacrifice is traced to Parvati. Sati, to avenge an insult to Iswara, in her own father's omission to ask her lord to an entertainment, consumed herself in the presence of the assembled gods. With this act of fealty (sati) the name of Dacsha's daughter has been identified; and her regeneration and reunion to her husband, as the mountain nymph Mera, or Parvati, have by some been supposed to furnish the incentive to similar acts. In the history of the hindoo celestial beings, the Rajpootni has a memorable lesson before her, that no domestic differences can afford exemption from this proof of faith: for Jupiter and Juno were not more eminent examples of connubial discord than Mera and Siva, who was not only alike unfaithful, but more cruel, driving Mera from his Olympus (kylas,) and forcing her to seek refuge in the murky caverns of Caucasus. Colonel Tod supposes that female immolation, originated with the sun-worshipping Saiva, and was common to all those nations who adored this the most splendid object of the visible creation, and he notices in support of this view, the practice of the Scythic Gete or Jut warrior of the Jaxartes, who devoted his wife, horse, arms, and slaves, to the flames; the "giant Gete" of Scandinavia, who forgot not on the shores of the Baltic his transoxianian habits; and the Frisian Frank and Saxon descended from him. The chief characteristic of satiism is its expiating quality: for by this act of faith, the Sati not only makes atonement for the sins of her husband, and secures the remission of her own, but has the joyful assurance of reunion to the object whose beatitude she procures. Menu inculcates no such doctrine, "Let her emaciate her body, by living voluntarily on pure flowers, roots, and fruit; but let her not, when her lord is deceased, even pronounce the name of another man." Again he says, "A virtuous wife ascends to heaven, if, after the decease of her lord, she devote herself to pious austerity; but a widow, who slights her deceased husband by marrying again, brings disgrace on herself here below, and shall be excluded from the seat of her lord."—*Coleman's Myth. Hind.*, p. 82; *Sonnerat's Voyages*, p. 43; *Ward's view of the Hindoos*, Vol. ii, pp. 19-20; *Cole. Myth.*; *Wilson's Hindoo Theatre*; *Tod's Rajasthan*, Vol. i, p. 633-35. See Argha, Bhavani, Bhat, Chandra, Chinnu mustuku, Inscriptions, Kalusa, Kali, Kumar, Kylas, Linga, Maha devi, Siva, Sacti, Surya, Tantra, Uma, Vahan, Viraj, Vishnu, Yavana.

PARWAN is situated in a nook of the Hindoo Kush, and has from its position near the terminus

of several of the chief passes, often been famous in Asiatic history. It is evidently the Karwan of Jaubert's Edrisi (a mistranscription for Farwan.) The town of Parwan is of no great size, but a nice enough place with agreeable environs, thronged bazaars, and rich inhabitants. At Parwan the army of Chinghez was checked for the moment in 1221, being defeated by the sultan Jalaluddin of Khwarizm. And in an action near Parwan in 1840 took place the ominous misconduct of a regiment of Bengal cavalry, which caused the day to be lost, with the lives of several officers, though Dost Mahomed Khan surrendered immediately afterwards.—*Yule Cathay*, Vol. ii, p. 558.

PARWAN, HIND. *Tamarix orientalis*, Tamarisk.

PARWARI, in the Bombay side of India, an outcaste race who reside outside the villages.

PARWAN, or Parman. On the summits of the hills on the island of Bombay, resided in 1842 about 75 families of cultivators. The costume of the women, and many of the words in their language are similar to the Hindi. They say that they immigrated from Rajpootanah.

PARWATTI, HIND. *Cocculus laeba*, also *Hedera helix*, *Cuscuta reflexa*, and *Dioscorea deltoidea*.

PARYAT, a river at Jubbulpoor cantonment.

PASA, a square ingot of silver weighing from thirty-two to sixty tolas. The word is current at Berhampur.

PASA, HIND. A die, plural pasé, those in use by the hindoos, are oblong, and both skill and chance are brought into play. The most celebrated match occurred between Yudhisthra, the eldest Pandava and Dhritarashtra.—*Wh. II. of I.*

PASA MAKATA, see Siam.

PASA LINIJA, a Penang wood of a light brown colour. A large tree; used only for planks: it soon decays.—*Col. Frith.*

PASALA, see Jains.

PASAND, HIND. Pleasing. Dil pasand, is *Citrullus vulgaris*, var. *fistulosus* Shah pasand, is *Mangifera indica*, the mango.

PASANI or Pusani kai, TAM. *Cucurbita maxima*, Duch.

PASAR, MALAY. A market.

PASARA GUNNA, TEL. *Diospyros*, sp. Mr. Beddome found this name given to *Acacia sundra* in the upper valley of the Godavari.

PASARGADA, see Fars, Pars.

PASARI PASER, HIND. Parrotia.

PASAS, Sr. Raisins. Pasas de Corinto, Currants.

PASELAY, TAM. A Tinnevely wood of a whitey brown colour. Used for furniture.—*Col. Frith.*

PASENDU, HIND. *Diospyros montana*.

PASENG, PERS. *Agagrus*.

PASER, HIND., or **Paseri** of Hazara, Fothergilla involucrata, also Parrotia jacquemontiana.

PASH, HIND. Euonymus fimbriata.

PASH, Pys or Pashu, HIND. A cord or rope, seen in the hands of some of the hindoo deities to strangle sinners with. Whoever is caught by it cannot get away.—*Cole. Myth. Hind.*, p. 391.

PASH also written Pakh, Push and Pukh, in the district of Rudak and the highlands of Kashgar, in the Waziri country, the supposed seat of the Affghan tribes, and of the origin of the words Pushtu and Pukhtu.

PASHA also pacha and padshah, **PERS.** A king, a noble.

PASHAI. A race mentioned repeatedly by Leech as one of the most numerous tribes in the Punjshir valley and adjoining passes. These are supposed to be mahomedans, but as the name is mentioned also by Elphinstone as that of one of the Kafir tribes part of them in the mountains may have retained their heathenism and independence.

PASHANA CHEDDI, TAM. Ocymum basilicum.

PASHI, TEL. Anogeissus acuminatus, *Wall.*

PASHIA. Amber necklaces worn by the women of Tibet.

PUSHIUBA PALM, see Palms, Pashiuba.

PASHKAND, PANJAB. Calotropis procera, *R. Brown.*

PASHM, also Pashmina, **HIND.**, **PERS.** Wool, shawl-wool, the fine wool which forms the material of the shawls generally in the Panjab. Pashm and pashmina are specially applied to the fine shawl-wool of Turian and Chanthan. Oagtu, is the only bridge in Kunawar by which laden sheep and mules can cross.—*Cleghorn's Panj. Rep.*, p. 50.

PASHMARAN, HIND. Thalictrum foliolosum.

PASHMINA FABRICS, embroidered with silk, and plain pashmina cloths, are produced extensively at Amritsar and Ludhiana, and a few at Lahore.

PASHONTI or Pachonti, **MALEAL.** Syn. of Isonandra acuminata, *Lindl.*

PASHPAPUR, an ancient town on the N. W. frontier of British India, mentioned in a play,—

Rak.—What news from Pashpapur?

Vir.—I have not much to tell, Sir, Where shall I commence.

Rak.—With Chandragupta's entry in the city,

Whatever my agents since have done, inform me.

Vir.—You will remember, Sir, when in close league

United by Chanakaya, Parvateswara

And Chandragupta in alliance, led

Their force against the city,—a wild multitude

Of Sakas, Yavanas and mountaineers,

The fierce Kambojas, with the tribes who dwell

Beyond the western streams and Persian hosts

Poured on us like a deluge.

PASHU-VIN-PAL, TAM. Cow's milk.

PASIR, see Kyans.

PASITIGRIS, see Khuzistan or Arabian.

PASOQUERIA DUMETORUM, Roxb. Syn. of Randia dumetorum, *Linn.*

PASPALUM a genus of grasses, of the order Raniceæ which, like some species of Panicum, forms one of the small grains cultivated in tropical countries as food for the poorer classes of the community. The genus is characterised in habit by having a continuous spiked rachis, on one side of which the spikelets are attached. The glume is 2-valved, 1-flowered; closely pressed to the two plane converse paleæ. Seed adhering to the paleæ. The E. Indian species are P. stoloniferum, *Bosc.*, *Linn.* P. frumentaceum, P. pilosum and P. scrobiculatum.—*Eng. Cyc.*; *Mason*; *Voigt*, p. 699.

PASPALUM FRUMENTACEUM, Linn.

Kodro,	BY	Kodrava,	
Punctured paspalum, HIND.		Walamu,	SINGH.
Menya,	GUZ.	Kiraruga,	TEL.
Kodaka, Koda, Kora, HIND.		Allu,	
Kodra,	KANGRA	Arikelu,	

This is an inferior grain, only used by the poorest classes. It is cultivated over almost all parts of India. It delights in a light, dry, loose soil, but will grow in a very barren one. The seed is an article of diet with the hindoos, particularly with those who inhabit the mountainous parts of the peninsula, as well as in the most northern parts of the country, or where the soil is barren and unsuited to the cultivation of those grains which are more beneficial. Dr. Roxburgh states that the boiled grain is as palatable as rice. He distinguishes from this another species, which Linnaeus called Paspalum kora, but it appears to be only a variety growing in moist situations. Both species are much relished by cattle either in a green or dry state. Its use is said to cause delirium, and the Kakum Rajputs of Ghazeepur never cultivate or eat kodo; "Nefas violare et frangere morsu," and the reason assigned is that, while under the influence of Mutouns, they

were set upon by some of the neighbouring tribes, and thus lost the greater part of their once extensive possessions. "Kisaree" (*Lathyrus sativus*) is another grain which is found to have injurious properties.—*Eng. Cyc.; Elliot.*

PASSES. In the Kuenluen, all passes above 15,000 ft. are closed in winter by the heavy snow-fall. The following are the principal passes in India.

(a) These two passes cannot be used for practical purposes.

In the southern part of the peninsula of India, Colligal has numerous small jungle covered hills and to the west of Colligal are the Neilgherry hills. The Animullay hills are in the S. W. border of Coimbatore and are richly clothed with valuable forests and with many elephants and some of the lower hill ranges from the Neilgherries, between which is the valley and Gap or Pass of Palghat leading to the western coast. The Guzzlehutty pass leads up the deep valley, separating the Neilgherry hills from Colligal. The Mana and the Neetee passes are on the Saraswati and the Doolee branches of the Ganges. Juwahir Darma or Belong, and Byans, are passes on the Gource, Dhonlee and Kalee rivers, branches of the Gogra. The Rotang pass, in the Himalaya in lat. 32° 24' N., and long. 77° 10' E., is 13,200 feet above the sea. The Rotang pass

Dharmasala leads to the heart of Central Asia. The Beas river rises in a sacred pool, called "Vyas Rikhi", in the Rotang pass, at the head of the Kulu valley. The scenery of the river valley is very beautiful, and is unlike that of the Chenab or Sutlej. The river is fringed with trees, and studded with green islands. There is a good riding path close along the bank which does not exist upon any other river in the Punjab. Besides deodar in the Upper Beas valley, "kail" *P. excelsa*, elm, maple, oak and walnut are abundant. On the Parbati, box occurs; also olive and the twisted cypress (*C. torulosa*) are found in small quantity.

Kunawar is usually divided into Upper and Lower Kunawar and includes the upper part of the Sutlej basin to the borders of Piti and Guge in Tibet. Its general direction is N. E. and S. W. It has two parallel bounding mountains. On the S. E. it is bounded by the Cis-Sutlej mountains and to the N. W. by the mountains of Piti. The mountains which descend from the two parallel bounding chains of Kunawar are very lofty. They are crossed in the usual route into Tibet by the Werang pass 13,200; by the Runang pass 14,500; the Kuibrang in the north, across the Cis-Sutlej, is 18,300. The Shatul pass across the Cis-Sutlej leading to Simla is 15,560, and the Hangrang into Piti is 14,800. The passes to Upper Piti are more lofty. The bed of the Sutlej from 8,000 to 9,000 feet at the upper part of Kunawar, descends to 4,000 feet in Lower Kunawar. In Lower Kunawar, the preponderating language is Hindi and is called Milchan, but the Blot preponderates in Upper Kunawar. The Lubrung or Kanam and the Lidung or Lippa are varieties of the Milchan. In Sungnum, the word Theburskud is used to designate all variations from the regular form of speech. In Kunawar, budd'hism decreases in the central districts and disappears in the southern, where brahminism in an impure form occurs with local gods and irregular priests, every hill having its deota or genius. Polyandry is general in Kunawar from the higher classes to the lowest chamars, one family having one wife, the elder brother being the more special husband. It is called Koopa. The tract of country belonging to Busehur, lies on both banks of the Sutlej, from lat. 31° 15' to 32° 4', and from long. 77° 50' to 78° 5'. It runs in a N. E. and S. W. direction, and the habitable part seldom exceeds eight miles in breadth. The mean number of inhabitants to a house in various parts of Kunawar is six. Polyandry, or a plurality of husbands, prevails, also, in Chinese Tartary and in the hilly tracts towards the plains. Besides this drawback on the increase of the population, there is another peculiar to Chinese Tartary and the adjoining countries; that is, celibacy, which is pro-

passed by numbers of the inhabitants; and in some villages the monks or lamas and nuns form almost half the population. A tribe of Hungrung Tartars occupy 378 square miles. *Bootunte* is a name given to the Tartars by the people of Lower Kunawar. They also call the Tartars Zhad, also Bhotiah, and their country is called Bhot and Bootunt. These Tartars differ greatly in appearance from the people of Lower Kunawar. At all the elevated passes, in Kunawar, there are a number of square piles of stones, called Shughar, upon which passengers usually place a piece of quartz, or attach rags to poles, which are fixed in the middle, there are also several Shughar on the neighbouring heights, sacred to the deota or spirits of the mountains, who are supposed to inhabit the loftiest and most inaccessible points, especially where there is much snow. The Shughar at the passes are erected by travellers, but those on the higher peaks are commonly made at the expense of some wealthy pilgrim not much accustomed to the mountains, who has succeeded in crossing a pass which is reckoned an arduous undertaking by an inhabitant of the plains.

The greatest part of Kunawar is occupied by vast chains of snowy mountains, inaccessible crags, or impenetrable forests. It was formerly under the dominion of a number of petty chiefs, of whom, there was almost one in each small district. The principal river in Kunawar is the Sutej, which flows through it from one end to the other; the chief branch, or that which has the longest course, issues from Rawun Rudd Lake, better known by the name of Lauka, or Langa-Cho, the last word meaning a sheet of water. It runs within the Himalaya mountains for 280 miles, and the first part of its course is nearly W. N. W. for 200 miles, to clear the heads of the Ganges and its tributary streams; it then enters Kunawar, and winds considerably, generally in a south-western direction, but it often runs due south, and, near where it leaves the Himalaya, its course is west for a long way. Within Kunawar, its

length is about eighty miles, after which it still flows W. S. W. for 160 more through the hills, and before it enters the plains it makes several bold sweeps, and penetrates the low sandstone range at Roopoor. It washes the hill towns of Rampoor, Bilaspoor, and Makhawal, and its course from Roopoor to its junction with the Beah or Beas, at Hurreeke Puttun, twelve miles above Ferozepoor, is about 130 miles in a south-westerly direction. Its whole length thus far is 570 miles, 440 of which lie within the mountains.

The passes from Kunawar through the outer Himalaya range, are fifteen in number:

Shatool, 15,555 feet, leading from Rol to Utharabee. This pass is reckoned worse than most of the others, not on account of its elevation, for it is inferior in altitude to many of the rest farther to the east, but from there being almost fourteen miles without even a single bush for fuel. It is open part of June, July, August, September, October, and sometimes November.

Soondroa. From Tangno to Rasgramee, the people represent it as crossing two ranges, and say it was very seldom attempted, and was never open more than two months in the year; so it is probably little below 16,000 feet.

Yoosoo, 15,877 feet, leading from Jangleeg to Rasgramee.

Boorendo, 15,171 feet, is the easiest pass in this quarter and most frequented; it leads from Jangleeg to Rasgramee, and is open seven or eight months. And during the rainy season almost all the snow dissolves.

Neebrung, 16,035 feet. *Goonas*, 16,026 feet. *Ghoosool*, 15,851 feet. From Chioara to Sungla of Tookpa. These three passes cross the top of the range within half a mile of each other.

The next is Roopeen, 15,480 feet, a very easy pass.

Nulgoon, 14,891 feet, is the lowest pass seen by Gerard, in the outer snowy range.

Barga, *Lumbee*, *Marja*, *Seenga*. These four passes are contained in the space of little more than a mile; they lead from Sungla, Rakcham, and Chetkool, to Lewar of Gurhwal, and like Goonas, Neebrung and Ghoosool, are crossed in different months. Barga is reckoned lowest, so is probably little above 15,000 feet; it is chiefly travelled by the Sungla people, being on the direct road from that place. The others are most likely between 16,000 and 17,000 feet, and are frequented by the inhabitants of Rakcham and Chetkool.

Sungla, from Chetkool to Boorasoo of Gurhwal, is reckoned lower than Kimlees, and may perhaps be 16,000 feet. The road is said to be generally bad, and is travelled for six months. There are three passes to the westward of

Shatool, the Jalsoo, Khéalig and Soongree, but they cannot be considered in the Himalaya, being from 2,000 to 4,000 feet below the circle of congelation. From the above account given of the passes, it will be seen that Mr. Fraser's saying there is no ghat for the conveyance of merchandise through the Himalaya, between Rampoor and Budreenath, was erroneous. The whole of these fifteen passes are almost as good as the Rampoor road, and many of them considerably better. Most of the passes to the eastward are said to be better than those mentioned: some of them are,

Shear Garh, a difficult pass.

Boorasoo to Chungsa, much snow, and rather difficult.

Jannubee to Chubrung, high, but very easy.

Kedarnath, said to be very difficult.

Domnees, from Budreenath to Chubrung, the pass is high, there is much snow, but the road is good, and is travelled by loaded cattle.

Birjee pass, Neetee pass, Dharma pass, and Jooar pass. These last four passes are travelled by cattle.

The passes leading from Kunawar to Chinese Tartary on the eastward, are six in number, all of which are practicable for loaded sheep.

Chungsakhago, from Chetka to Neilung, on the Jankee or Jannubee branch of the Ganges, a lofty pass, probably not under 18,000 feet.

Koono pass, from Koono to Tunge.

Teedoong, from Charung to Tunge.

These two roads are each about five days' journey, without an intermediate village, and like Chungsakhago, cross a high flat piece of ground.

Keoobrung, from Nisung to Bekhur, five stages without a village. The road leads up the Taglakhar river for 3½ days, and is often difficult.

Gangtung, from Dabling to Bekhur. This properly speaking, is not a distinct road.

From Nungea to Shipke, there are two roads:—1st. Peeming, the height of which is only 13,661 feet. Part of this path is very rugged in clearing the deep-worn glen of the Opsung rivulet.

There are four passes leading to Speetee:

From Pundrabecs, } open 5 months.

Taree from Wangpo, }

From Leepe, not ascertained.

Manerung from Soonguum, open three and a half or four months.

The Kunawari and Tartar races estimate the altitudes of the passes, by the difficulty of breathing they experience in ascending them. Those who cross the outer chain, attribute the symptoms from which they suffer to the noxious qualities of a poisonous plant; but the best informed, who are in the habit of traversing

heights where there is no vegetation, know well that they are produced by the height alone.

In Kunawar, the greatest height at which rice that requires water has been observed, is 6,600 feet. There are other kinds, which are not watered, that grow at 8,000 and 9,000 feet, but what is produced in Kashmir, which forms the chief subsistence of the inhabitants requires the fields to be laid under water, as in Bengal. In the higher parts cows are rare, and their places is supplied by the Yak of Tartary, described by Captain Turner; the male is called Yak: Yag, or Yokh, and the female Breemo; the produce between them and the cow is common, the male being named Zo or Zofo, and the female Zono. The Yak are strong and hardy, and like cold places.—*Lord Elgin; Powell's Hand-book, Vol. i, p. 305.*

PASSA, PORT. Raisins.

PASSAGE ISLAND, a name of Barn Island in the Straits of Singapore.

PASSALÆ, see Topes.

PASSALUS, a genus of coleoptera, which abounds over India and the Archipelago. See Coleoptera.

PASSALUM KOWOO, TEL. Tallow.

PASSAPA-WARNAM, TEL. Yellow.

PASSAPOO, also Pampi, TEL. Turmeric, *Curcuma longa*.

PASSAPU-VENNY, TEL. Gamboge.

PASSELI KEERAY, TAM. *Portulaca quadrifida*, *Roxb., Linn.*

PASSERAWA, see Inscriptions.

PASSERINÆ, the sparrow sub-family of birds of the family Fringillidæ, as under:—

SUB-FAM.—Passerinae.

Passer ipdicus, *Jard.* Indian House sparrow, all E. Indies.

„ *salicicolus*, *Viellot*, Willow sparrow, Europe, N. Africa, Afghanistan.

„ *cinnamomeus*, *Gould.* Cinnamon-headed sparrow, Himalaya.

„ *pyrrhonotus*, *Blyth.* Rufous backed sparrow, Sind.

„ *rutilans*—? Japan.

„ *montanus*, *L.* Mountain sparrow, Himalaya to Java and China.

„ *pyrrhopterus*, *Lesson.*

„ *petronius*, *L.*, S. Europe, Afghanistan.

„ *flaveolus*, *Blyth.* Burmah.

„ *jugiferus*, *Temm.*, Philippines.

„ *salicarius*, Spanish sparrow, Kohat, West frontier of the Punjab.

Some ornithologists regard the *Passer domesticus*, *P. italiae* (vel *cisalpinus*), and *P. salicarius* (vel *hispaniolensis*), of Europe, as being local varieties merely of the same: yet they hold true to their distinctive differences of colouring, wheresoever found; and examples from Afghanistan and the extreme N. W. of India differ in no appreciable respect from Algerian specimens with which they have been compared.

Passer montanus, the Tree Sparrow of Europe,

Asia (commoner to the eastward) Siberia, Tibet, Sikkim, Arrakan, Malayan peninsula, Java, China, Japan.

Passer domesticus, the House Sparrow of Europe, Asia, N. Africa; the Indian race (*P. indicus* of Jardine and Selby) differing slightly from the European in the paleness of the females and young, the much more albescent hue of the lower parts, and bright rufous colouring on the back of the adult male.

Passer salicarius (vel *hispaniolensis*.) of Barbary and the southern parts of Europe, Asia Minor, Bokhara, and Affghanistan, visits the Peshawar valley and Kohat in large flocks, being everywhere more highly gregarious than *P. domesticus*, *P. petronia*, (*Petronia stulta*), also of S. Europe and N. Africa to Medeira. It is common in Affghanistan. See Sparrow.

PASSERINA.

Kan sui, CHIN.

This Chinese plant has an acrid and poisonous juice, its tubercular or nodulose roots, are sold with the tubers separated: they are given in anasarca, ascites, tympanatis, hernia, hydrocele, and dysuria and are applied to ease pain and to the ears in cases of deafness.—*Smith*.

PASSERINA CHAMÆDAPHNE.

Yuen-hwa, CHIN.

In China, the small dried flowers of this plant are infused in a spirit much drunk in Central China as a sort of cordial, tonic and anti-febrile tincture. The leaves, flowers and root-bark are applied to buboes as counter-irritants. They are said to act on the womb.

PASSEWA, HIND. An extract from Poppy capsules.

PASS-HEADACHE, are headaches which occur in the high passes of the Himalaya, said to be caused by the odour of a species of *Allium* or *Artemisia*, or *Pleurospermum gouanianum*, but doubtless only occasioned by the altitude.

PASSIFLORACEÆ, the Passion flower tribe of plants comprise about 14 genera and more than 200 species of which 20 occur in the E. Indies. In several species, the succulent aril and pulp that surround the seed are fragrant, juicy, cooling and pleasant, others of them are cultivated for their ornamental flowers. The name is derived from a fancied resemblance between the parts of their flower and the emblems of Our Saviour's crucifixion. In the five anthers the Spanish monks saw his wounds, in the triple style the three nails by which he was fixed to the cross, and in the column on which the ovary is elevated the pillar to which he was bound; a number of fleshy threads which spread from a cup within the flower were finally likened to the crown of thorns. "There are cuts," says Sir James Smith, "to be found in some old books, apparently drawn from description, in which the

flower is made up of the very things themselves."

The tribe comprehends a large number of species, chiefly found in a wild state in America, and within or near the tropical parts of that continent. They are all twining plants, often scrambling over trees to a considerable length, and in many cases are most beautiful objects on account of their large gaily or richly-coloured flowers. This makes them favourites in gardens, where many are cultivated, particularly the *P. alata*, *P. quadrangularis*, *P. edulis*, *P. cærulea*, *P. racemosa*, *B. loudoni*, *P. onychina*, *P. palmata*, and *P. filamentosa*, all of which are strikingly handsome. It is, however, chiefly for their fruit that they are valued in the countries where they grow wild, in consequence of the pulp which envelopes the seeds being cool and refreshing, with something of a fragrant bouquet. Under the name of Granadilla the *P. quadrangularis* is well known in Brazil, where its fruit is as large as a child's head and it is now grown in many parts of the East Indies, the Water-Lemon of the West Indies is the produce of *P. laurifolia*; *P. maliformis* bears what is called the Sweet Calabash; and the pleasant pulp of *P. edulis* furnishes the confectioner with the most delicate material for the flavouring of ices. Many however are of no value for their fruit, and some are actually fetid. Some of them are fruit bearing, as the *P. edulis* and *P. laurifolia*, the latter is known from its dark shining leaves. There are several wild varieties *Modecca palmata*, *Courtallum*, *Cochin*. *Modecca dubia*, *Sumatra*. *Modecca trilolata*, *Chittagong*. *Modecca furfuracea*, *Prome*. *Modecca extensa*, *Khassya*. —*Riddell's; Gardening Eng. Cyc.*

PASSIFLORA ALATA, an ornamental climber common in most parts of India, of easy culture. The greater number do well on the plains, they require abundance of water. Not at all adapted for pot culture, easily propagated by cuttings during the rains under glass; some of the common varieties can be propagated in the open air during that season, require a well manured soil. Natives of the tropics, many of which have been hybridized.

PASSIFLORA CHINENSIS, *Wall.*, a native of China.

PASSIFLORA FETIDA. A species with fetid flowers, but very elegant moss-like involucre, though rarely noticed in gardens, it may be often seen creeping over the hedges in Maulmein like an indigenous plant.—*Mason*.

PASSIFLORA LAURIFOLIA: Laurel-leaved passion flower of the numerous species of passion flower seen wandering over the arbours and trellises of Tenasserim, none exceed in beauty and fragrance, the laurel-leaved passion flower, called in the West Indies, water lemon

vine, which appears to have been the first of the tribe introduced into Burmah.—*Mason*.

PASSIFLORA QUADRANGULARIS, Gracilifolia, flourishes well in Burmah and on the Tenasserim Coast, and is very prolific. The smooth oblong fruit grows nearly as large as a cucumber, and contains a succulent pulp, which make a cooling delicious dish, and when prepared in tarts, can scarcely be distinguished from green apple. The Rev. Mr. Bennett of Tavoy, introduced it among the Karens, by whom it is highly esteemed, and much sought for, it possesses all the attractive qualities of fine fruit, handsome fragrant blossoms, and when trailed over an arbor, a rich passing shade.—*Mason*; *Jaffrey*.

PASTE, in jewellery, imitative gem.

PASTILLES.

Wan-yen-hiang, CHIN. | Ood-batti, HIND.

The Ood-batti pastilles in use in India, burned at mahomedan tombs are made of benzoin. The Wan-yen-hiang of the Chinese are long, limp torches of bamboo covered with a composition of elm-saw-dust some fragrant substance, and a small quantity of sulphur or orpiment. They are burned to drive away mosquitoes or overcome bad smells. They are sold in China for one cash each.—*Smith*.

PASTULÆ CORINTHIACÆ, LAT. Cur-rants.

PASSU-MUNNÆ-KEERAY, TAM. Premna integrifolia.

PASSUPU, TEL. Curcuma longa.

PASSURUM KOWOO, TEL. Tallow.

PASTALE KAI ANTAGAREI, TAM. Wedelia calendulacea, Less.

PASTAWANA, HIND. Pshtu, Grewia oppositifolia.

PASTELL also Glasio, SP. Pastel: Guede: Voude, FR. Wood.

PASTINACA, a genus of the Apiacæ, of which *P. hookeriana*, *P. rigens*, *P. sprengeliana* and *P. sativa* are grown in the E. Indies. The name is (from *Pastinum*, the Latin name for a two-pronged fork.)—*Wight's Icon*. No. 1,008, 1,009, 1,010.

PASTINACA SATIVA, L.

Hu-lo-pu, CHIN. | Parsnip, ENG.
var. *a*. *Sylvestris*, is the wild parsnip of Europe and the Caucasus.

var. *b*. *Edulis* is the cultivated parsnip. It is extensively cultivated in Guernsey and Jersey as fodder for cattle. In the north of Ireland parsnips are used in the composition of a kind of beer brewed with hops. Wine and ardent spirits are likewise made from the roots.—*Voigt. Eng. Cyc*.

PASTINACA.

Shikakul, HIND.

A plant of the N. W. of India.

PASTINACA SEKAKUL, *Honigberger*, is an edible species, a native of Syria and Egypt. It

has a gray root; a terete downy branched stem; pinnate downy leaves; pinnatifid cut leaflets, blunt and unequally toothed. *Pastinaca setacul* is the Shakakul misree (*Sium sisarum*, Ainslie) so much used by Eastern doctors, and not without reason, for this root is a very efficacious medicine. Dr. Royle thought it came from Cashmere to Hindostan, but Honigberger heard that it is imported from Egypt; and hence, probably it is called the Egyptian (misree).—*Honigberger*, p. 322.

PASTO, BENG. *Papaver somniferum*, Linn.

PASTOO, the language of the Affghans, also written pushtoo, pushto. Since the invasion of Mahmud of Ghazni in the eleventh century, there has been a constant influx into India of Affghans, as conquerors and settlers and this has been so great from particular districts that some tribes have altogether disappeared from Affghanistan. In some localities in India, the Affghan settlers are said to have preserved the Pushto almost in its purity up to the present day, having from the outset married amongst themselves. In some parts of Bundelkund and in the territory of the Nawab of Rampur, whole towns and villages may be found in which the Affghan language is still almost exclusively spoken and is the medium of general communication. Captain Raverty considers that although on numerous points, the Pushto bears a great similarity to the Semitic and Iranian languages it is totally different in construction, and in idiom also, from any of the Indu-Sanscrit dialects.—*Capt. H. G. Raverty's Grammar and Dictionary to the Pushto, Pukhto, or Affghan language*. See Pash.

PASTOORMAIL, Pasturma, Pastrama, in Asia Minor, beef preserved with garlic and pepper, and dried in the sun for winter food. It is prepared in Wallachia and Moldavia, and largely shipped from Varna. Besides providing Aleppo, and Damascus, 6000 cwt. or more is yearly sent from Kaissariah to Constantinople.—*Simmond's Dict*.

PASTORAL TRIBES. The principal feature in which the Western Affghans differ from the Eastern, is formed by the numerous pastoral tribes. These, though they have all some common points of resemblance, such as their living in tents, and moving with the seasons, differ among themselves in other particulars principally relating to the distance between their summer and winter stations, and to the degree in which they combine agriculture with pasturage. The summer station is called Eilauk, and the winter station Kishlauk, two words which both the Affghans and Persians have borrowed for the Tartars. The tents almost universally used among the Affghans are of a kind of black blanket, or rather of coarse black camel, such as is used for the same purpose in the

greater part of Persia. It is called Kizhdee in the Afghan language, Seeah-chadar, in Persian, and Karra-ooee in Turkish: both of these last phrases mean "black tents" the term generally given to them by Europeans. The tents of the tribes that move little are always larger and better than those of the very migratory people. The latter have often fine tents which they leave at the stations where the climate is most severe, carrying lighter ones on their journeys to the places where shelter is less required. The Western Affghans are not all shepherds: on the contrary, although the space given up to pasture may be much more extensive than that employed in agriculture, yet the number of citizens and villagers must, I should imagine, considerably exceed that of the wandering hordes.—*Elphinstone's Kingdom of Cabul*, p. 390. See Nomades.

Aharwarrah, is a territory on the north-east frontier of Malwa which contains many districts. The Ahar tribe or caste, from whom the territory derives its names of Aharwarah and the Aharat are spread through Rohilcund and other districts in the N. W. Provinces, following pastoral pursuits. They claim to be descended from the Yadu race of Rajputs. Agricultural tribes are originally pastoral and inclined to be predatory, farmers keep cattle and waggons and till the soil, generally possess great military vigor, most democratic constitution and occupy a dominant position, gardening tribes, peaceable, unmartial.—*Malcolm's Cent. Ind.*, Vol. i, p. 325. See Rajput. These seem to be the Ahir, q. v.

PASTOR ROSEUS, syn. of *Sturnus vulgaris*. The 'Rose-coloured Pastor' of Europe, Asia, and Africa: common in India; rare in Britain.—*Adams*. See Starling.

PASUPU, TEL. *Curcuma longa*.—*Roxb.*, *Rheede*.

PASUT, HIND., of Lahoul, a compound of alum, &c., used in dyeing.

PASTURE GRASSES of India, in the Himalaya many of the pasture-grasses are the same as in Europe, and the cereals are cultivated in the spring and summer, with some rice in the rains. See Graminaceæ, Panicaceæ.

PASTUWANNA, HIND. *Grewia oppositifolia*, also *Grewia villosa*, *Perci pastu wanne*, HIND., is *Fluggea virosa*.

PASUMMAH, Rejang is the alphabet of Lemba and Pasumamah on the western side of Sumatra. It consists of 23 substantive characters, formed of upright scratches or strokes, and on the whole it is more complete than either the Batak or Korinchii. See India, Kyan, Language, Writing.

PASUMUNI-KIRE, TAM. *Premnia integrifolia*.

PASUPATAS, see Kala Priyanath.

PASUPU, *Curcuma longa*, R. 1, 3
Rheede, xi, 11.

PASUPU KADIMI, or Daduga, TEL. *Nau-clea cordifolia*, R.

PASWAJ, HIND. A woman's gown of a light texture and gay colour.

PAT, HIND. Part of the sugar-cane mill.

PAT is the wool of a goat of Kabul inferior to the real pashmina or shawl wool of Tibet.—*Powell's Hand-book, Econ. Prod., Punjab*, p. 21.

PAT, a desert country between Asnee and the hills west of the Indus, above Methenkote. It is wandered over by the Ghorkhar, the *Equus onager*.

PAT, HIND. A leaf of a plant; a book.

PAT. The five pat which still exist in Northern Hindustan, were Padipat, Sonpat, Indrapat, Tilpat, and Baghpat, of which all but the last were situated on the right or western bank of the Jumna. The term prastha, according to H. H. Wilson, means anything spread out or extended, and is commonly applied to any level piece of ground, including also table-land on the top of a hill. But its more literal or restricted meaning would appear to be that particular extent of land which would require a prastha of seed, that is, 48 double hands-ful, or about 48 imperial pints, or two-thirds of a bushel. This was, no doubt, its original meaning, but in the lapse of time it must gradually have acquired the meaning, which it still has, of any good-sized piece of open plain. Indraprastha would, therefore, mean the plain of Indra, which was, seemingly the name of the person who first settled there. Popular tradition assigns the five pat to the five Pandu brothers.—*Cunningham's Travels of a Hindoo*.

PAT, HIND. *Corchorus capsularis*; Banpat, HIND. *Corchorus olitorius*; Tez-pat, HIND. *Cinnamomum albiflorum*.

PAT, HIND. *Hibiscus cannabinus*, Linn., *Roxb.*, W. & A.

PAT, amongst Mahrattas, is a second marriage.

PAT, MAHR. A plank.

PATA, Leaf of *Corchorus olitorius*.—*Ben. Ph.*, 219.

PATA, TEL. *Cissampelos pareira*, L.—*Hook. f. and Th.* i, 198.—*Cic. convolvulacea*, Willd.—*W. and A.* 51.—*B.* iii, 842.

PATA, MALEAL. *Avicennia tomentosa*.—*Rheede*; L.

PATA, SANS. *Sida lanceolata*.

PATA, MALAY. Chart.

PATTA, HIND., a strip of iron for making gun barrel.

PATTA-KA-BANDUQ, HIND. A kind of gun-barrel.

PATA ARIGE CHETTU, TEL. *Paspalum scrobiculatum*, L.

PATAKA, HIND. *Abutilon indicum*.

PATAKA, MALAY. *Cucurbita citrullus* Linn.

PATAKAM, TAM., TEL. The sectarian mark on the foreheads of Hindoos.

PATA KE JAR, HIND. Pata root.

PATAKHEN, HIND. *Cratægus oxyacantha*.

PATA-KHUREE, BENG., HIND. *Saccharum fuscum*, Roerb.

PATAKI, HIND., of Salt Range, *Gymnosporia spinosa*, *Celastrus spinosus*, *Cissampelos pareira*.

PATAL, see Lead.

PATALA, in hindooism, the region below the earth, inhabited by the nagas or serpent demi-gods. The lowest of the seven lower worlds, by Ziegenbalg identified with Naraka, hell.—*Hind. Theat.*, Vol. ii, p. 270. See Bali, Pratiapada, Mehrawun, Vamana, Yama or Dhermarajah.

PATALA, or Pitasila, the capital of Lower Sindh, identified with Nirankot, or Hyderabad, also called Patalpur. The position of Nirankot is fixed at Hyderabad by the concurrent testimony of M'Murdo, Masson, Burton, and Eastwick. Sir Henry Elliott alone places it at Jarak as he thinks that that locality agrees better with the descriptions of the native historians. From a comparison of the narratives of Arrian and Curtius, it appears that the raja of Patala having made his submission to Alexander at Brahmana, or the city of brahmans, the conqueror sailed leisurely down the river for three days, when he heard that the Indian prince had suddenly abandoned his country and fled to the desert.—*Cunningham's Ancient Geog. of India*, pp. 279, 283, 285. See Pattala.

PATALANS, see Kabul.

PATALA GANDHI, or Patala garuda, TEL. *Ophioxylon serpentinum*, L.—*R.* i, 694.—*W.* l. 849.—*Rheede*, vi, 47.

PATALEE, BENG.

PATALENE, see Bactria, Greeks of Asia.

PATALI, of Padari chettu, TEL. *Bignonia suavcolens*, R. The Sans Bhuta padiri, *W.* 623, perhaps refers to this tree.

PATAL-GANNI, TEL. *Ophioxylon serpentinum*.

PATALI TIVVA, or Vekkudu tige, TEL. *Cardiospermum halicacabum*, L.

PATALIPUTRA. When Hwen Thsang entered the capital of Magadha, the city, originally called Kusumapura, had been deserted for a long time, and was then in ruins. It was 70 li, or 11½ miles, in circuit, exclusive of the new town of Pataliputra-pura. This name the Greeks slightly altered to Palibothra on the authority of Megasthenes, whose account is preserved by Arrian. The capital

city of India is Palibothra, in the confines of the Prasii, near the confluence of the two great rivers Erannoboas and Ganges. Erannoboas is reckoned the third river throughout all India, and is inferior to none but the Indus and the Ganges, into the last of which it discharges its waters. Megasthenes assures us that the length of this city is 80 stadia, the breadth 15; that it is surrounded with a ditch, which takes up 6 acres of ground and is 30 cubits deep; that the walls are adorned with 570 towers and 64 gates. Diodorus attributes the foundation of the city to Herakles, by whom they mean Bala-Rama, the brother of Krishna, but this early origin is not countenanced by the native authorities. According to the Vayu Purana the city of Kusumapura or Pataliputra was founded by raja Udayaswa, the grandson of Ajatasatru, who was the well-known contemporary of Buddha; but the 'Mahawanso' makes Udaya the son of Ajatasatru. According to the buddhist accounts, when Buddha crossed the Ganges, on his last journey from Rajagriha to Vaisali, the two ministers of Ajatasatru, king of Magadha, were engaged in building a fort at the village of Patali as a check upon the Wajji or people of Vriji. Buddha then predicted that it would become a great city. From these concurring authorities General Cunningham concludes that the building of the city of Pataliputra was actually begun in the reign of Ajatasatru, but was not finished until the reign of his son, or grandson, Udaya, about B.C. 450. The position of the city at the junction of the Ganges and Erannhemay was formerly supposed to refer to the confluence of the Gandak or Hiranyavati, which joins the Ganges immediately opposite Patna. But it has been conclusively shown by Mr. Ravenshaw that the Son river formerly joined the Ganges just above the city of Patna. As the Son, or "golden" river, is also called the Hiranyabaha, or the golden, on account of its broad yellow sands, its identification with the Erannoboas is complete both as to name and position. Strabo and Pliny agree with Arrian in calling the people of Palibothra by the name of Prasii, which modern writers have unanimously referred to the Sanscrit prachya, or "eastern." But it seems to General Cunningham that Prasii is only the Greek form of Palasiya or Parasiya, a "man of Palasa or Parasa," which is an actual and well-known name of Magadha, of which Palibothra was the capital. It obtained this name from the palasa, or Butea frondosa, which still grows as luxuriantly in the province as in the time of Hwen Thsang. The common form of the name is Paras, or when quickly pronounced Pras, which he takes to be the true

original of the Greek Prasii. This derivation is supported by the spelling of the name given by Curtius, who calls the people Pharrasii, which is an almost exact transcript of the Indian name Parasiya. The Praxiakos of Ælian is only the derivative from Parasar.

As Magadha was the scene of Buddha's early career as a religious reformer, it possesses a greater number of holy places connected with Buddhism than any other province of India. The chief places are Buddha-Gaya, Kukkuta-pada, Rajagriha, Kusagarapura, Nalanda, In-brasilaguha, and the Kapotika monastery—*General Cunningham's Ancient Geography of India*, pp. 452-455.

PATALPOOREE is a remarkable place, most probably once above ground, but on which two united rivers have deposited their silt and formed a soil. A cave leads to a spacious square temple, about seven feet high, the roof of which is supported by thick walls and ranges of pillars. In its middle is a large lingam of Siva, over which water is poured by the pilgrims. Surrounding this presiding deity, are other gods and goddesses of the Hindu Pantheon. Towards the left, is seen a dead forked tree, which, with its withered trunk, has stood there for several hundred years. General Cunningham's Archaeological Report, states that, according to Hwen Thsang, Allahabad was situated at the confluence of the two rivers, but to the west of a large sandy plain. In the midst of the city there was a brahminical temple, to which the presentation of a single piece of money procured as much merit as that of one thousand pieces elsewhere. Before the principal room of the temple there was a large tree with wide-spreading branches, which was said to be the dwelling of an anthropophagous demon. The tree was surrounded with human bones, the remains of pilgrims who had sacrificed their lives before the temple,—a custom which had been observed from time immemorial. This tree is now situated underground at one side of a pillared court, which would appear to have been open formerly, and which is supposed to be the remains of the temple described by Hwen Thsang. Originally both tree and temple must have been on the natural ground-level, but from the constant accumulation of rubbish they have been gradually earthed up until the whole of the lower portion of the temple has disappeared underground. The upper portion has long ago been removed, and the only access to the Akshay Bat now available is by a flight of steps which leads down to a square pillared court-yard.—*Tr. of Hind.*, Vol. i, pp. 313-317. See Chandragupta, India, Inscriptions, Palibotha.

PATALLOO GOTSA, OORIAH. Dioscorea.

PATAMAR, a vessel employed in the coast-

ing-trade of Bombay to Ceylon. Patamar vessels may be considered the best in India; as they sail remarkably well, and stow a good cargo. They belong principally to Bombay merchants, and carry on the whole of the coasting-trade to that port. They are grab-built: that is, with a prow stem, which is the same length as the keel; and the dimensions of the large class are seventy-six feet six inches in length, twenty-one feet six inches in breadth, eleven feet nine inches in depth, and about two hundred tons burthen. They are planked with teak, upon jungle-wood frames; and are really very handsome vessels, being put together in the European manner, with nails, bolts, &c., and their bottoms are sheathed with inch-board, and a layer of chunam mixed with cocoa-nut oil and a portion of damar (country rosin): this is a very durable substance, and a great preservative to the plank against worms. Some of the smaller class of these vessels, of about sixty tons burthen, are sewed together with coir, as other native boats are. The small class has one, and the large class two masts, with the lattan sail: the foremast raking forward, for the purpose of keeping the ponderous yard clear when it is raised or lowered. The yard is slung at one-third of its length, the tack of the sail is brought to the stern-head, through a fixed block; and the sheet hauled aft at the side, as usual. The haul yard is a pendent and treble block, from the masthead aft to midships; thus acting as a back-stay for the mast's security, together with about two pairs of shrouds. These vessels generally export salt from Bombay to the coast, and take back coir, rice, cocoa-nuts, copra, oil, timber, sandalwood, pepper, and various articles, the production of the coast. They are navigated with much skill, by men of the Mopila caste and other mahomedans; and have a crew of ten or twelve men, and a tindal, who are good pilots and navigators off the coast from Bombay to Cape Comorin; generally speaking, honest and trustworthy.

PATAN, see Nepal.

PATANA, Guz. Pisum sativum.

PATANA, see Chandragupta.

PATANG, HIND. Patanga, Sans.

PATANGHEE, SINGH. *Cassalpinia sappan*, Linn., *Roarb.*, W. & A.

PATANGA CHAKKA, or Bukkapu chettu, TEL. *Cassalpinia sappan*, L. Bukkum wood.

PATANJALA, see Jogi or Yogi, Vedas, Vidya.

PATANJALA, Sans., from the sage Patanjali; which word is made up of pat, to throw down, and anjali, joined hands. This conjunction teaches us, that people went before him for instruction with joined hands.

PATANI, a Malaya-Siamese province on the opposite coast. The Orang-patani are supposed

ed by Captain Osborn to be identical with the Orang-laut, or men of the sea. They are found hunting in small groups, for their numbers do not entitle them to the appellation of tribes, in the neighbourhood of British colonies, as well as the most secluded and barren places in Malaya. They are usually found east of the Straits of Malacca, although, they reach the western side sometimes. Under fifty different names, they are known to the inhabitants of Siam, Java, Sumatra, Borneo, and the Moluccas, and in all cases bear a bad reputation. The best description of them is given by Mr. Thomson, a gentleman who has written on the archipelago. With the sarkab, or fish-spear, and the parang, or chopper, as their only implements, they eke out a miserable subsistence from the stores of the rivers and forests. They neither dig nor plant, and yet live nearly independent of their fellow-men; for to them, the staple of life in the east, rice is a luxury. Tobacco, they procure by the barter of fish, and a few marketables collected from the forests and coral reefs. The personal appearance of these people is unprepossessing, and their deportment lazy and slovenly, united to much filthiness of person.—*Osborn's Quelah*, pp. 254-256, 259.

PATANI HOEK, see Papuans.

PATANI LODE, DUK. See Kiliorum.

PATAR MOUNTAINS also Pat'har mountains. Central India is a table-land of unequal surface, from 1,500 to 2,500 feet above the sea, bounded by the Aravalli mountains on the west, and those of the Vindhya on the south, supported on the east by a lower range in Bundelcund, and sloping gradually on the north-east into the basin of the Ganges. It is a diversified but fertile tract. The Patar, or plateau of Central India, is distinct from the Vindhya to the south, and the Aravalli to the west, and its underlying rock is trap.

PATARA, a river near Shikarpoor in Bhopal.

PATARI, a wandering tribe of people who speak the Telugu language, some of whom have travelled into the Mahratta country pursuing their avocation of manufacturers of hand-mills, from which they are also named "Chakki karne-walay" by mahomedans, and are seemingly identical with the Takinkar. They have a deity whom they term Satwai, whose emblem is suspended around their necks, and resembles the forms worshipped as Hanumanu. They dwell within the walls, in huts made of a fine grass. They marry at all ages; they do not eat the cow or bullock, and they bury all their dead.

PATA ROOT, Pata-ke-jur. HIND. Root of *Sida acuta*.—*Ben. Ph.*, 219.

PATA-SHEYALA, BENG. *Blyxa octandra*.

PATA-SEYALA, BENG.

PATATA, SP. Potato.

PATATE, FR., IT. Potato.

PATAYAT BAG, DUK. *Felis tigris*, Linn.

PATCHA-ARISE, TAM. *Euphorbia thymifolia*, Linn., Roeb.

PATCHAK, HIND. *Aucklandia costus*, *Falconar*.

PATCHALAY WOOD, ANGLO-TAM. *Dalbergia paniculata*, Roeb., W. & A.

PATCHAM, see Jhareja, Kattyawar, Kutch.

PATCHEAPPAH, a hindoo of the neighbourhood of Madras, from whose bequests, schools were founded.

PATCHET, MAL. Leeches.

PATCHI KALLOO, TAM. Emerald.

PATCHI also Coorvi, TAM., a bird.

PATCHI LEAVES, ANGLO-HIND. White Horehound.

PATCHOULI, BENG. *Pogostemon patchouli*, Pellet, also written Patchooly or Pucha-pat, is found in every bazaar almost throughout India, and seems to grow abundantly as well as on the opposite shore of the Malay Peninsula, in province Wellesley, in India, and in a perfectly wild state at Pinang. M. de Hugel found it growing wild near Canton. The odour of the dried plant is strong and peculiar, and to some persons not agreeable, the dried tops imported into England are a foot or more in length. In Europe it is principally used for perfumery purposes, it being a favorite with the French who import it largely from Bourbon. They were led to use it because, a few years ago, real Indian shawls bore an extravagant price, and purchasers distinguished them by the odour of Patchouli, with which they were perfumed, and on discovering this secret, the French manufactures got into the way of importing the plant to perfume articles of their own make and thus palm off home-spun shawls for real Indian. The Arabs use and export it more than any other nation. Their annual pilgrim ships take up an immense quantity of the leaf, they use it principally for stuffing mattresses and pillows, and assert, that it is very efficacious in preventing contagion and prolonging life. The characteristic smell of Chinese and Indian Ink, is owing to an admixture of this plant on its manufacture. Some people put the dry leaves in a muslin bag, and thus use it as is done with lavender, for scenting drawers in which linen is kept; and this is the best way to use it, as this odour like musk, is most agreeable when very dilute. In India it is used as an ingredient in the Goorakoo compound of tobacco for smoking and also for scenting the hair of women. It requires no sort of preparation, being simply gathered and dried in the sun:

PATELLIDÆ

so much drying, however, is hurtful, inasmuch as it renders the leaf liable to crumble to dust in packing and stowing on board. By distillation it yields a volatile oil, on which the odour and remarkable properties depend. This oil is in common use in India for imparting the peculiar fragrance to clothes: among the superior classes of natives in Pinang it sells at the rate of a dollar and a quarter, to a dollar and a half, per pekul. In Bengal, some which was imported from Pinang several years previous sold at 11 Rupees eight Annas per maund. Later investments have sold at a much lower rate.

PATCH PATTA, GUZ., HIND. White Horehound.

PATCHU, SEC Loochoo or Lieu-cheu.

PATEE, HIND. *Cyperus inundatus*.

PATEEALAH. At the Lahore Exhibition of 1864, there were specimens of gold from Karrar on the Markanda river in the Amballa district; from Spiti; from the Beyas near Haripur in Kangra district, from Lahaul, from the Jhilmam river, from Kas Gabhir in the Jhilmam district, from Attock and Hazara. Gold has been found in large quantities between Umballa and Kalkah. In the neighbourhood of Patecalah is a small mountain stream, where gold is washed for by the Soojbir or gold-washers.

PATEE KHOREE, or Patee-Khuree, BENG. *Saccharum fuscum*.

PATEE-NEEBOO, HIND. *Citrus acida*.

PATEE-PATEE, BENG. *Maranta dichotoma*.

PATEL, amongst the Mahrattas the headman of a village. Opinions are various as to the origin and attributes of the patel, the most important personage in village sway, whose office is by many deemed foreign to the pure hindoo system, and to which language even his title is deemed alien. But there is no doubt that both office and title are of ancient growth, and even etymological rule proves the patel to be head (pati) of the community. The office of patel of Mewar was originally elective; he was "primus inter pares," the constituted attorney or representative of the commune, and as the medium between the cultivator and the government, enjoyed benefits from both. Besides his bapota, and the seerana, or one-fortieth of all produce from the ryot, he had a remission of a third or fourth of the rent from such extra lands as he might cultivate in addition to his patrimony.—*Tod's Rajasthan, Vol. i, pp. 494, 500, 501, 510.* See Mangta.

PATELLIDÆ, the limpet family of molluscs, as under:—

FAM. XIII. Patellidæ. Limpets.

Genera. Patella. Rock limpet, *rec. 100 sp. fossil, 100 sp.*

PATHAN

Sub-genera. Naqalla, rec. Scutellina, rec. 7 sp.

Acmaea, rec. 20 sp.

Sub-genera. Lepeta, rec. Pifidium, rec.

Gadinea, rec. 8 sp. fossil, 1 sp.

Siphonaria, rec. 30 sp. fossil, 3 sp.

PATELLA, a genus of molluscs of the family Patellidæ.

PATENA, SING. Grass covered openings, amounting to millions of acres, in the forests of Ceylon, about the middle of the hills, on which, except the *Careya arborea* and *Embliza officinalis*, trees do not grow. In the lower ranges they are covered with tall lemon-grass, *Andropogon schoenanthus*. Coffee has lately, by the use of manures, been planted on them. See Patina.

PATENGA, TEL. *Briedelia montana*.

PATERA, HIND. *Typha elephantina*.

PATERA, a small boat shaped cup, in use, in the religious rites of the hindoos, see Argha.

PATERI, MALAY. Syn. of Borax.

PATERNOSTERS, DUT. Beads.

PATER-NOSTER ERBZE, GER. *Abrus precatorius, Linn.*

PATERU or Pata veru or Kappatige, TEL. *Tiliacora acuminata, Miers.—Hook. f. i. 187*—*Cocculus ac. W. and A. 44.—Menispermum lycarpum, R. iii, 816.*

PAT FANNAS, MAHR. *Artocarpus hirsuta, Lam.*

PATH, HIND. *Cissampelos pareira*.

PATHA, HIND. Fibre of the *Chamaerops ritchiana*, of which mats, &c., are made.

PATHIA. *Hordeum hexastichum*.

PATHAKA, SANS. He who reads, from path, to read.

PAT'HAN, HIND. A term employed in India, to distinguish the Affghan mahomedans and their descendants, most of whom are named or styled Khan. Between A.H. 589 and A.H. 962, forty Pathan kings ruled in Hindustan. The average duration of their rule was 9½ years. Of these, there were five dynasties. The names of Patan, Rohilla, Affghan, which serve at the present time to designate the Affghan nation, are really those of so many distinct races now confounded in one. The word is said to be derived from the Sanscrit Patina to rush. The term is applied rather in a loose manner to all the tribes bordering on the common frontiers of India, Persia, and the province of Balk, in the ancient province of Paropamisus. It is also supposed to be a corruption of the Arabic Fathan (a conqueror), or a derivation from the Hindustani paithna, to penetrate (into the hostile ranks). It is an honourable term in Arabia, where "Khurasani" (a native of Khorassan), leads men to suspect a Persian, and the other generic appellation of the Affghan tribes, Sulaymani, a descendant from Solomon,

reminds the people of their proverb, Sulaymani harama?" "the Affghans are ruffians." Patan or Pathan are names applied rather in a loose manner to all the tribes bordering on the common frontiers of India, Persia, and the province of Balk; that is to say, the ancient province of Paropamisus. The people are now found in all parts of Hindostan and the Deccan, mixed with the rest of the inhabitants. The greatest colony is that founded chiefly by Eusofzye, at no very remote period, in the settlement of the Rohillas, whose wars with British India have rendered their name so well known in England. The Affghans call themselves "Bin i Israel," or children of Israel, but consider the name of "Yahooddee," or Jew, as opprobrious, they affirm that Nebuchadnezzar, after the destruction of the temple of Jerusalem, removed them to Bameean (the present Cabul). They were called Affghans, after their leader, Affghana, who was a son of the uncle of Asaf (Solomon's vizir), who was the son of Berkin. This person's pedigree is derived from a collateral branch, his own father being unknown, which is not at all uncommon in the East. They say that they lived as Jews till Kaled (who obtained the title of Caliph,) in the first century of the mahomedan era, called on them to take part in the war against the infidels. For these services the Caliph gave their commander, Kysee, the title of Abdoo Rusheed, which means the son of the mighty, and appointed him "Butan" (an Arabic word,) or head of his tribe (answering to a clan in Scotland). It is really from this title of Butan that the Affghans were called, in India, Patan. After the campaign under Kaled the Affghans returned to their native country, and were governed by a royal race, descended from Kyanee or Cyrus, till the eleventh century, when they were conquered by Mahomed, a Turkoman prince, who, after having first established his power in Ghiznee, conquered a great part of India, and founded the Affghian kingdom, which continued till Baber, a descendant of Tamerlane, founded the Mongol empire. The Affghans have never migrated in large bodies, but have accompanied the mahomedan rulers of India, all of whom have entered from Affghanistan and brought bodies of the Pathan with them. Some of these have settled in many places throughout northern India and in some parts of the south, some of them in villages, where they own and cultivate the soil. They have been in considerable numbers in the native army of British India, particularly in the corps of irregular cavalry, and in northern India, in the Civil Service of Government. A few Pathan settlements are found in the Punjab and about Delhi. They are numerous in the upper Doab and Rohilkund, and, all over India, Pathan principalities,

jaghires and families were, till lately, met with. All the Pathans to the west of the Indus, as well as a few to the east of it, in the north of the Hazarah district and west of that of Rawal Pindi speak Pushtu. The Pathan are the only people of Central Asia who in comparatively recent times have come to reside to any considerable extent in India. The Pathan tribes had advanced into the north-east corner of Affghanistan within comparatively recent historical times, for the lower valleys of the Kabul country were once occupied by hindoo races, and the peaks of the Safed Koh, between Jelalabad and Kabul, bear such hindoo names as Sita Ran, &c. The term Affghian is hardly known to the people whom Europeans so designate, for the tribes have not as yet coalesced into a nation. Physically the Affghian people are among the finest on the earth, with a broad, robust, ruddy, manly look, and they are hardy and bold. They have a pleasant, frank, simple, unaffected way. About Kabul, they are fair, many with red hair and blue eyes, but some of the tribes in the lower and hotter hills and valleys near India, have somewhat dark skins. The majority are astute, intriguing, ambitious and faithless, avaricious, fickle, uncertain and crafty, and in bold unblushing lying a hindoo is a mere child to an Affghian. They are not trusted as mercenaries. The eastern tribes are politically quite independent, and the amir of Kabul does not pretend to any authority over them. Such of them as have come to India, have been largely employed and been becoming more and more the military retainers in the native army, of British India. The purer Affghian are quite illiterate. The Euzufzye and other tribes in the north are comparatively recent conquerors of the northern hills and valleys, where they have mixed with a free hindoo people and are fairer than the other Affghian tribes. The government of the tribes is a democracy, their representation and self-government being by their Jirgah, but, like most rude people no man's nationality extends beyond his own clan. Mr. Campbell supposes them to be Arian and probably of similar origin to the Jat. The Affghans in Peshawar and Kohat are British subjects. The *Gadun* or *Jadun* race, on the right bank of the Indus where that river issues from the Himalayas near Torbela, have been supposed to be Rajputs, but they are Pathans who speak Pushtoo. The Pathan of India is the descendant of the Affghian soldiers who came into India with the armies of Timur, Baber, Nadir Shah, Mahmud and Ahmad Shah, Abdallah, and carved out principalities or obtained land for themselves, and their descendants; and there are numerous individuals of the Affghian and Baluch tribes, large, powerful, fair men scattered throughout

India, who are seeking a livelihood in it as soldiers, traffickers and chapmen. The Pathan styles himself by the titular designation of khan, but this is never permitted at courts, khan being one of the honorific appellations bestowed by Indian sovereigns. The term Pathan is also said to be derived from Butan the Arabic for a mast or chief of the tribe, a titular appellation given to Kyse, a leader of the Affghans under Kalid. — *General Ferrier*, p. 5; *Chatfield's Hindustan*, p. 70; *Burton's Pilgrimage to Mecca*, Vol. i, p. 85; *C. p.* 87; *Rennell's Memoir*, p. 2; *Elphinstone's Kingdom of Cabul*, p. 350; *Bjornstjerna's British Empire in the East*, pp. 233-34. See Affghans, Derajat, India, Kabul, Khyber, Mahomedanism, Sikhs.

PATHANBED, HIND. *Picrorrhiza kurrooa*.

PATHANI, or Thani, a dependency of Siam, with a population of 100,000.

PATHAR, HIND. A big stone, a monument. Colonel Tod says he was particularly struck with that of a Charun bard, to whose memory they had set up a pallia, or tomb-stone, on which is his effigy, his lance at rest, and shield extended, who most likely fell defending his tanda. This tract had been grievously oppressed by the banditti who dwelt amidst the ravines of the Bunas, on the western declivity of the plateau. "Who durst," said his guide, have passed the Pat'har eighteen months ago? the Meenas would have killed you for the cakes you had about you; now you may carry gold. These green fields would have been shared, perhaps reaped altogether, by them; but now, though there is no superfluity, there is 'play for the teeth,' and we can put our turban under our heads at night without the fear of missing it in the morning. At one of the cairns, in the midst of the wood, they all paused for a second; it was raised over the brother of the Bhatti thakoor, and each, as he passed, added a stone to this monumental heap. — *Tod's Rajasthan*, Vol. ii, pp. 659-60.

PATHAR KA PHUL, HIND., a lichen, see *Kal pashi*.

PA-THA-YOU-SHA, BURM., a bast of Arracan from a species of *Musa* strips seven feet in length; fine in texture, light coloured: formed of several easily diffusible layers: the outer layers, rather dense, and compact, and the inner cancellar. — *Royle*.

PATHI, BURM. The term by which, in Burmah, native born mahomedans are known.

PATHI, HIND, of Shahpur, a weight of wool, equals the shearing of one fleece of a sheep.

PATHIRI MARAM, TAM. *Bignonia che-lonoides*, *Linn.*

PATHLI, HIND. Chamba hills; *Lonicera quinquelocularis*.

PATHANGA, HIND. *Cassalpinia sappan*.

PATHANISARKA, HIND. *Symplocos cæ-togoides*.

PATHANKOT, see *Kohistan*.

PATHAR, the plateau of Central India. The whole of this tract was under the princes of Chetore, but the sack of this famed fortress by Alla, and the enormous slaughter of the Gehlote had so weakened their authority, that the original Meenas re-possest themselves of a their native hills, or leagued with the subordinate vassals of Chetore. — *Tod's Rajasthan*, Vol. ii, p. 457. See Achari, Kunawar, Pata Sankara.

PATHOR of Chenab, *Afr.* *Marsdenia roylei Wight*.

PATHOOR-CHHOOR, BENG. *Hibiscus rose-sinensis*, also *Coleus amboinicus*.

PATHIRAINI, HIND., an iron graver used in Multan for tracing patterns for gold inlay work, seemingly a corruption of pattern.

PATHUR CHUR, HIND. *Plectranthus aromaticus*, also *BENG.* *Coleus amboinicus*, *Lou*.

PATI, BENG. *Cyperus inundatus*, *Willd.*
PATIALA, runs the east boundary of Bahawalpoor. It was formed by a Jat family, of the Sikh religion, who emigrated from the Manjahl, about the beginning of the 18th century. The area is 5,412 sq. m. with a population of 1,586,000, and a revenue of Rs. 30,00,000.

PATIENCE, *Rumex patientia*, *W.*

PATIKANDA, or Manchi kanda, *TEI* *Arum* (*Amorphophallus*) *campanulatum*, *R.*

PATILI, SANS. *Bignonia suaveolens*.

PATINA, in Ceylon, grass land, for the most part rock, barely covered with a superstratum of soil, but producing long grass, and here and there a stunted and thorny bush or tree. Like the prairies of America the patina are burned off every year. — *Simmond's Dic* See *Patena*.

PATI-NEBOO, BENG. Common acid lime *Citrus bergamia*.

PATING, HIND, of Thibet, dried apricot brought from Balti.

PATINGA, TAM. *Cassalpinia sappan*.

PATIPAL, ANAR. See *Hot-springs*.

PATI PATI, BENG. *Maranta dichotoma Will.*

PATIRA, HIND. *Typha angustifolia*.

PATIS, HIND. *Aconitum heterophyllum*.

PATISCHOROEIS of Strabo, the Patiskhan of the cuneiform inscription, are the Bakhtian of Iuristan.

PAT JOL, JAV. A spade.

PATKA, HIND. A scarf, a labourers turban.

PAT-KILL, BENG. *Hibiscus rosa-sinensis*.

PATKEALE. A tree of the western part of Ceylon, a cubic foot of its wood weighs 4 lbs. and it lasts 40 years. It is used for common house-building. — *Mr. Mendis*.

PAT-KOY, a pass leading to Bamo and China.

It was the route followed by the Burmans in their invasions of Assam and is the means of communication between the Singpho tribes on the north and south of the Patkoy mountains.

PATKURU, HIND. *Roylea elegans*.

PATNA, a revenue district of Bengal formed out of the ancient Bahar. Patna town is on the right bank of the Ganges in Bahar province. The following pergunnahs of Patna, were transferred by the British to the rajah of Najpore, on the 24th August 1806, viz., Patna: Khass Patna; Nawagurh; Ghureeland; Tonageer; Borasambre. To the extreme west of Nepaul, lies Almorah, a hill station, wrested from the Nepaulese in the wars of 1815-16; to the extreme east is Darjeling, another hill station, used by the supreme Government of India as a sanatorium for invalids. The principal British cities and military stations which border on the Nepaul territory along the line of the Ganges, are, Berhampore (contiguous to the Morung district), Monghyr, Patna, Dinapore, Ghazee-pore, Benares, Allahabad, Cawnpore, Lucknow, Futtighur, and Bareilly; the last named town lying opposite to a Nepaulese fort called Doti, and a few miles from the hill station of Almorah. Vaisali, is to the north of Patna.—*Aitchison's Treatise*, p. 100. See Chandragupta, Hindoo, Inscriptions, Khutri, Megasthenes, Topes.

PATNA, a river of Panna.

PATNIA, see Krishna.

PATOLASAMU, or Adavipotla, TEL. *Trichosanthes cucumerina*, L., *Br.*, 531. Roxburgh applies the same to *T. dioica* and in Bengal both have the same name. The word is Sans, and probably hence the Telugu word Potla.

PATONGA, CAN., SANS. *Cesalpinia sappan*.

PATONWA, URIA., a species of *Gardenia*, a tree of Ganjam and Gumsur, extreme height 20 feet, circumference 1 foot and height from ground to the intersection of the first branch, 5 feet. Used chiefly for firewood being tolerably common. The fruit thrown into a pond of water kills all the fish in it and is used for that purpose by the keyout or fishermen. This mode of catching fish is designated "Macho Mohneebaro." The fruit is said to be poisonous, but the seeds are used medicinally for fever.—*Capt. Macdonald*.

PATOO or Asta; is a bast from Beerbhoom, is like the Putwa from Bhagulpore.—*Royle*.

PATOR, see Cocoa-nut.

PATPATI CHENCHKA, BENG.

PATPATULA, HIND. *Oreoseris lanuginosa*, Ban patrak, HIND., is *Saxifraga ligulata*.

PATRA, SANS, *Cicer arietinum*.

PATRA, HIND. *Cinnamomum albiflorum*.

PATRA, see Argha, Patara.

PATRA, HIND. The Kataya or wire drawers work bench.

PAT-RAJ, a Pujari amongst the Mahrattas, W.E.

PATRANG, HIND. A silk dress.

PATRAS,—? *Mirabilis jalapa*.

PATRAWALA DAMA, HIND. *Solanum gracilipes*.

PATRI, HIND. A neck chain of silk, carrying amulets.

PATRI, HIND. A hone; also a little iron wedge or plate.

PATR-I-ATISH, HIND., PERS. Flint.

PATRIS, HIND. *Aconitum heterophyllum*, Haiza-ka pattar, HIND. *Kalanchoe varians*. Mit pattar, HIND. *Machilus odoratissimus*. Til pattar, HIND. *Acer creticum*, and *A. cultratum*.

PATRISIA, see *Flacourtiaceæ*.

PATSA RAI, TEL. Emerald.

PATSA-KAYA, TEL. *Citrullus colocynthis*, *Shrad.*

PATSAN, HIND. of Delhi, &c., the Sankukra, *Hibiscus cannabinus*.

PATSHAING, BURM. A drum-harmonicum, a musical instrument used in Burmah. It consists of a circular tub-like frame about thirty inches high and four feet six inches in diameter. This frame is formed of separate wooden staves fancifully carved, and fitting by tenon into a hook.—*Yule*.

PATSHI-MAN, TEL. *Conocarpus acuminata*.

PATSUM, HIND. *Helicteres isora*.

PATSU-PULA-GUNTA-GALI-JERU, TEL. *Wedelia calendulacea*, *Less.*

PATTA, also Pat or Pattr, HIND. Any leaf, the leaf of the dwarf palm, *Chamærops*.

PATTA, MALAL. Bark.

PATTAH, HIND. A lease of land: in India, under British rule, are three land tenures one known as the Zemindari or permanent settlement made in 1792 by Lord Cornwallis, of Bengal proper, and since then extended to Behar and Orissa. The lands are divided amongst landlords who pay a quit rent to Government, which in Bengal has been definitely settled. Something similar has been proposed for Oudh as the Talukdari. The Ryotwari tenure in Madras, established by Sir T. Munro, under which the cultivators are the owners of the soil and pay direct to Government. A modification of this has been introduced into Bombay.

The Pattadari tenure was established by Mr. R. Martins Bird in the N. W. Provinces and it has since been extended to the Punjab. In this, Government deal direct with village communities who are jointly responsible for the assessment.

In Bombay and Madras, Government transacts its revenue business direct with the cultivating ryot or farmer, who is regarded as the feuer or proprietor paying a feu duty, and so long as that is paid he cannot be dispossessed. Neither in Bombay nor Madras is there any

middleman. In Bengal, however, the British took up the Zemindar system, who, under mahomedan rule, had been partly a rent collector and partly a landed proprietor, and elected him to be owner to the exclusion, in many cases, of the rights of the cultivators. Subsequently the Government to the exclusion of the real owner elected the tenant or the village community. In Bengal and Oudh, the land-tax is still levied on estates, in Northern India on villages and proprietary holdings. But, in Madras, on individual fields. In Bombay, however, the taxes levied on the blocks of 10 or 12 acres accords to the convenience of the occupiers and they are tenants for 30 years. In copper-plate grants dug from the ruins of the ancient Oojein (presented to the Royal Asiatic Society,) the prince's patents (putta) conferring gifts are addressed to the Patta-cila and ryots. Colonel Tod never heard an etymology of the former word, but imagined it to be from patta 'grant,' or 'patent,' and cila, which means a nail, or sharp instrument; metaphorically, that which binds or unites these patents; all, however, having pati, or chief, as the basis. *Tod's Rajasthan, Vol. i, pp. 500-501; Transactions of the Asiatic Society.*

PATTA DEL, CYNGH. *Artocarpus, sp.* See Ceylon.

PATTAH, HIND. Gold ribbon, broader than gotah.

PATTAI 'MARAM. *Mimosa hexandrus, Roxb., W. Ic.*

PATTA-ISTRI, is the first lawful wife of a king.

PATTAKARI, SANS. *Euphorbia neriifolia. E. nivulia, Buch., W. Ic.*

PATTAL, HIND. Plates made of leaves by the Dosali caste.

PATTALA, an ancient town in Sind. It is impossible to fix the exact site of Pattala, because there are properly two deltas, a superior, and an inferior one; exclusive of the many islands formed by the Indus, when it approaches the sea. Tatta is near the head of the inferior delta, and the ancient accounts mention only one great delta, having Pattala at the upper angle of it. In Ptolemy's map (Asia, Tab. xx.) Pattala is placed very far below the place where the Indus begins to separate into branches. Pattala (Tattah) and the delta itself are now looked for with uncertainty, also the "Barbaricum emporium," of the "Periplus."—*Rennell's Memoir, p. 179; Postan's Personal Observations, p. 117.*

PATTAM, TAM. A gold frontlet ornament worn by hindoo women.

PATTANA, Pattan, Patnam, SANS., TAM., TEL. A town.

PATTANG, DUK. *Cassalpinia sappan, Linn. Roxb.; W. and A.*

PATTANG, HIND. A paper kite, pattang-bazi, flying kites, pattang saz, a kite maker.

PATTANGA CHAKKA, TEL. *Cassalpinia sappan, Linn., Roxb., W. and A.*

PATTANGAY, HIND. *Cassalpinia sappan, Linn., Roxb., W. and A.*

PATTAN-SOMNATH, is 29 miles N. W. of Diu, in lat. 20° 53' N. and long. 70° 35'. See Somnath.

PATTAR-KA-TEL, HIND. Petroleum.

PATTARU, TEL. *Tribulus lanuginosus.*

PATTA TAMARA, MALEAL. *Macaranga indica, R. W.*

PATTAYA, CAN. Bark.

PATTHARMAN, JH. *Callicarpa incana, Roxb.*

PATTHRA, HIND. *Malcolmia strigosa.*

PATTE, HIND. Leaves, see Olay.

PATTEEL—? an article of jewellery.

PATTENGI CHUCKA, *Cassalpinia sappan.*

PATTENS, ARAB. Kulkal, worn in all eastern countries.

PATTEOON, DUK. *Euphorbia neriifolia.*

PATTERI: also piger, MAL. Borax.

PATTEUN or P'tun, DUK., HIND. *Euphorbia nivulia, Buch., W. Ic.*

PATTI, TEL. *Gossypium herbaceum, L.*

PATTI or Chinapati, in the eastern Panjab, residence of Chinese hostages in time of Kanishka.

PATTIALA, its Maharajah aided with supplies in the revolt of 1857 when before Delhi. He was elected a member of the Viceroy's council and proposed a bill prohibiting the killing of cows.

PATTICARAMU, TEL. Alum.

PATTI KASHMIRI, HIND. *Rhododendron campanulatum.*

Sitawur patti, is *Asparagus punjabensis.*

Gillar pattr, is *Laminaria, sp.*

Tarar pattr, is *Dioscorea deltoidea.*

Til pattr, is *Marlea begonifolia.*

Tre pattr, is *Trifolium pratense.*

Tri pattr, is *Marsilea quadrifolia.*

PATTI KARPASAMU, TEL. *Gossypium indicum, Lam.*

PATTI VAYNGU, MAL., one of the inferior sorts of jungle-wood: of little use or value.—*Edey, M. & C.*

PATTRA, SANS. *Aristolochia bractea, Retz., Roxb.*

PATTRA, HIND., of Muzaffargarh, palm leaf fibre.

PATTUNGA CUTTAY or Vattunga cuttay, TAM. *Cassalpinia sappan* wood, used for dyeing cotton, cloth, mats, &c., of a bright red colour. The dye is fixed by means of the Chebulic myrobalan and alum.—*Ains. Mat. Med., p. 204.*

PATTUNGH, TAM. *Cassalpinia sappan, Linn., Roxb., W. and A.*

PATTU TIGE or Bhu sarkara, TEL. *Nieuhria oblongifolia, DC.*

PATTU, HIND., white woollen cloth. A blanket or wrapper made of pattu, a breadth of woollen cloth sewn together.

Pattu abshar, HIND. Striped woollen cloth.

Pattu chet, woollen cloth stamped with a woollen pattern.

Pattu-dahzang, cloth made at Dahzang near Ghazni.

Pattu-foduk, a Ladakh woollen fabric.

Pattu ramnagri, the pattu fabric made at Ramnagar.

PATU, HIND. See Asta, Patoo.

PATU, see Veddha.

PATUAH, or Juanga, a forest race inhabiting the Tributary Mahals, to the south of Singhbroom in Cuttack, scattered in the Mahals or Killahs of Keonjur, Pal Leyra, (30 villages,) Dhekenal (6 villages,) and Hindole 6 villages. In Dhekenal alone their numbers are stated at 1,005 persons. The stature of the men does not exceed 5 feet 2 inches and in the women 4 feet 3 inches or 4 feet 4 inches. Their forms are slight with little muscular development, and physique weak. Their face is shorter and broader than that of the Uriah, nose is flat and nostril wide. Their colour is not darker than the Uriah peasant. The men are not handsome, but the women are repulsively ugly. The men dress like the peasantry of the neighbourhood, but all the covering of the women consists of two bunches of twigs with their leaves attached, one before and one behind, which are changed daily, kept in their position by a strip of bark or a string of glazed earthenware beads passed twenty or thirty times round the waist and over the stems of the twigs, hence the name of the tribe, Patuah, literally people of the leaf, but they call themselves Juanga. The women also wear necklaces of the same kind of beads, and their hair is gathered together in a knot at the back of the head fastened by a string with a silver or brass button at each end of it. The women wear no blanket or covering at night but sleep between two fires. Their traditions are to the effect that they were formerly vain of fine dress and were wont to lay aside their good clothes to prevent them being soiled, and wear such leaves when attending to the cleaning of the cow-house or other duty, when one day, a Thakurani or according to some, Sita, appeared and commanded them as a punishment for their vanity always to wear such leaves. Dr. Shortt mentions that the legend of Killah is that a Rishi commanded them to wear the leaves. They believe that if they violated these commands they would be devoured by tigers. Women dance in a circle to the noise of a large drum beaten by the men, moving round and round in the same measured step, occasionally advancing towards the musicians and then retreating, but keeping the body in-

clined towards the musicians. Their villages are in some clearing or opening in the forest; are small with about 6 or 8 families in poor and mean thatched huts of wattle and dab, each family in its own dwelling. They have no lands, but sometimes assist in the cultivation of the neighbourhood. Their avocations are chiefly those of the chase, using the bow and arrow and dogs; they kill deer, hogs and not unfrequently snakes, of the flesh of which, especially that of the Python molurus, they are very fond. Except the cow, they are omnivorous. Their usual food is insipid and nauseous roots (tunga, kurba and panialu,) and the seeds of the jungle grasses. They all call themselves pudhan, and have no system of caste. If they have any worship, it is one inspired by a desire to avert evil; they, however, deny that they worship any deity or have any image, but they pay homage to nameless spirits who inhabit the woods and mountains, and make offering of a fowl, a goat or rice or spirits to the genus loci. In the month bysakh, they offer libations to the manes of their deceased ancestors. They bury their dead. Marriages are arranged by the parents and are scenes of revelling and drunkenness. They adhere to one wife unless she prove unfruitful; like many hindoos, they will not pronounce their wives names. Their language is not similar to Uria. They are perhaps only an offshoot from some of the forest races occupying the mountainous region from Mirzapore to the shores of the Bay of Bengal. The Kurambar women of the Wynaad and the Chenchur of Masulipatam and Guntur, are said to have all the same costume. And the Ilolier, a degraded race near Mangalore, are said to have worn the same but have now a cloth in front.—*Mr. Samwells, in Ben. As. Soc. Jour. No. iv, of 1856.*

PATU-GALI-GITSA, TEL. *Crotalaria retusa.*

PATULEE, BENG. *Bignonia suaveolens*, Roxb.

PATUN CITY occupies a rising spot of ground, situated about two miles S. by E. of Khatmandoo, and close to the confluence of the Munnohra, Tookcha, and Bhagurutty rivers. The figure ascribed to it, is that of the Chucro, or wheel of Narain. Patun is called Yellodaise by the Newart; and it is likewise occasionally distinguished from Deo Patun, by the appellations of Lallit-Patun and Lall-Patun. It is a neater town than Khatmandoo.

PATUNGH, TAM. *Cassalpinia sappan*, Linn.

PATUREA, a river of Kotah.

PATWA, HIND. The red juicy calyx of *Hibiscus subdariffa* used for making jelly, &c.

PATWA MAWAL, also Ada, TEL. *Bauhinia racemosa*. See Maljhun.

PATWARI, HIND. A village accountant, responsible for keeping the accounts of the vil-

lage, noticing changes in the list of proprietors, and accounting between the head man or lambardar and the proprietors for the share of revenue paid by each.

PATTY, and Pajel, or short and pointed headed, and Wallampory, the right-hand chanks. Bertolacci mentions, as a peculiarity observed by the Ceylon fishermen, that all shells found to the northward of a line drawn from a point about midway from Manaar to the opposite coast of India are of the kind called "patty," and are distinguished by a short flat head, and all those found to the southward of that line are of the kind called "pajel," and are known from having a longer and more pointed head than the former. The "Wallampory or 'right-hand chanks,' are found of both kinds."

PAUCHI MANU, or Pauchinon, TEL. *Anogeissus acuminatus*, Wall. *Conocarpus acuminata*.

PAUCHONTEE, or Indian gutta tree, *Isonandra acuminata*, Lindl., interesting in an economical point of view, is common in the densely crowded tracts of Coorg, abounding at the foot of the ghats N. E. of Trevandrum, the eastern part of Wynaad, Anamally mountains, and Cochin territories, from lat. $8^{\circ} 30'$ to lat. $10^{\circ} 30'$, and at an elevation of 2,500 feet to 3,000 feet above the level of the sea. It attains a height of 80 to 100 feet, and a diameter of 2 to 4 feet, and it rises up to a great height without giving off any branches. It is the Pauley tree of Wynaad, and the Pauchontee tree of Cochin; it belongs to the natural order Sapotaceæ, and has a close affinity to the gutta-percha tree of the Malayan peninsula. It yields a milky juice which concretes, and is brittle at an ordinary temperature. It softens by the heat of the hand and mouth, and may be moulded between the fingers. It readily melts by the application of heat, and becomes very sticky. This stickiness is gradually destroyed by contact with water. It forms a paste with coal-tar, naptha, and oil of turpentine. The substance has excellent insulating powers, and may be used successfully for coating the wires of telegraphs. It is probable that at present several thousands of these trees fall annually under the axe of the wood-cutter, as the Government forests in Wynaad give way to the extension of coffee-planting, and the private forests in Malabar to raggi cultivation. In 1855, General Cullen forwarded a drawing and description of it. The wood of the Pauchontee tree is in gravity not less than 55 lbs. the cubic foot, and a bar of one inch square, with 18 inches clear of the supports, at each end, broke with a long fibrous fracture, after a weight of 440 lbs. had been imposed:—though not till this weight had for some minutes been suspend-

ed from the bar. This tenacity, is as high if not higher than that of teak. A tree when tapped, two taps at every three feet, from the base to sixty feet high, or 40 taps in all, yielded in twelve hours about eight pints or pounds of the sap. The exudation from the trunk has some resemblance to the gutta-percha of commerce. According to General Cullen, in 5 or 6 hours upwards of $1\frac{1}{2}$ lbs. was collected from 4 or 5 incisions in one tree.

The tree abounds in the Cochin Sircar territory and on the cardamum table-lands of Travancore, and at the Pool on the summit of the ghauts above Chocuraputtee, it appears to be common in all the forest tracts at all within the influence of the S. W. rains.—*Report of the Madras Museum of 1856.*

Tung, CHIN. | Peh-tung, CHIN.

A tree of China, furnishing an excellent timber, much prized for musical instruments. The large cordate-leaves are used as a wash for sores and to strengthen the hair when turning grey. Bark vermifuge and diuretic.—*Smith.*

PAUMBEN, in lat. $9^{\circ} 17' N.$, long. $79^{\circ} 14' E.$, is a small town on the western end of the island of Ramisseram. The Paumben Channel is betwixt Hindoostan and Ceylon. Operations for the widening of it, were undertaken by Col. Monteath and described in Mad. Lit. Trans., Vol. vi, 3. The Paumben channel is between the islands of Ramisseram and Manaar. These two almost connect Ceylon and the Continent and form what is known as Adam's Bridge at the head of the Gulf of Manaar. By a long continued series of operations from 1836 to 1856, this channel was deepened by the Madras Government to thirteen feet of water. See Ramisseram, Adam's bridge.

PAUNA-THA, BURM. *Laurus nitida*.

Pu	of Kanawar,	Chesnut,	<i>ENG.</i>

This fine picturesque tree grows in most of the higher hills, Cis and Trans-Indus, at from 4,000 to 9,000 feet, is found in the Sutlej valley between Rampur and Sungnam at an elevation of 5,000 to 8,000 feet, and attains girths up to 10 and 15 feet. The wood is light coloured and easily worked but is not much valued, being used for ordinary building purposes, packing cases, water troughs, tea boxes, rough pattern making. Some of the Tibetan drinking cups are made from it. Seeds eaten in time of scarcity. The Indian horse chesnut is a lofty and not less ornamental tree than the common horse chesnut, abundant in Kulu and other parts of the hills, from 6,000 to 8,000 and 9,000 feet; and is found on the mountains at elevations of from 8,000 to 10,000 feet, in Kemaon, Gurhwal and Sirmore, also near the sources of the Ganges and in Kanawur. The seed contains a large proportion of secula, and though combined with some bitter principle, is eaten in the Himalaya. The root called Jauzmukaddar bankhor, is used for horses in cholice, and is recommended as an external application in rheumatism. The wood is white and soft, sometimes used for furniture, and turns well in the lathe. It is a beautiful tree, yielding a grateful shade; the seeds are eaten by the hill people in times of scarcity but require long maceration in water first, as they are very acrid. Grows to a very great size and strength; wood soft and strong, of a white colour, veined, fine grained; polishes well; used for building and cabinet-making purposes.—*Royle's, Ill. Him. The head is surmounted by an aigrette of 24 upright feathers. In the male the tail-coverts consist of feathers with loose barbs and of unequal size, the upper one shortest, each terminated by numerous eyes or circlets of a metallic iridescent brilliancy; these the bird has the power of erecting into a circle or wheel, which presents, when the sun shines on it, an object of dazzling splendour. The female has the aigrette, but has not the splendid ornament with which the male is gifted; her colours generally are sombre. This species is spread over India, it is readily domesticated, and many hindoo temples have considerable flocks of them. The bird as domesticated in Europe, is identical with the wild bird of India. Col. Williamson, in his account of peacock-shooting, states that he had seen about the passes in the Jungletary district surprising quantities of wild pea-fowls. Whole woods were covered with their beautiful plumage, to which the rising sun imparted additional brilliancy. 'I speak within bounds,' continues Colonel Williamson, "when I assert that there could not be less than twelve or fifteen hundred pea-fowls, of various sizes, within sight of the spot where I stood for near an hour."—*Eng. PAVO JAPONENSIS, *Aldrov.*

P. Javanicus, *Horsfield.*

Prevailing tints blue and green, varying intensity and mutually changing into each other according as the light falls more or less directly upon them. In size and proportions the two species are nearly similar, but the crest of *P. javanicus* is twice as long as that of *P. cristatus*, and the feathers of which it is composed are regularly barbed from the base upwards in the adult bird, and of equal breadth throughout. Head and crest interchangeably blue and green.—*Jerdon.*

PAVO MUTICUS, L.

P. assamicus, *McLelland.*

Is found in all the countries from Assam through Burmah to Malacca, and the islands. It has spurs, its crest is composed of about ten or more slender barbed feathers. It has more green and gold and less blue in its plumage than *P. cristatus*.—*Jerdon Birds of India.*

PAWANG.

PAVONIA ODORATA, Willd.

Pavonia sidoides, *Horn. D.C.*

Hibiscus odoratus, *Roxb.*

PAVO or Puvarasa marum, TAM. *Thespesia populneus*.

PAWA or Padraona, an ancient city on the Gandak river. See Topes.

PAWANG. The Rev. P. Favre, Apostolic Missionary of Malacca, mentions that the Pawang are priests, teachers, physicians, and sorcerers. Under any of these titles they have not much to do amongst the members of their own nation; many of them do not believe that the Pawang have any supernatural powers as sorcerers or as priests, nor do they attribute any efficacy to the acts they perform under these two titles. The functions of priests amongst them consist only in performing some superstitious practices as they have no true and real worship. Amongst the Malays their skill is much in honour, and their persons objects both of veneration and of fear. The Malays have a firm faith in the efficacy of the supplications of the Pawangs, and an extraordinary dread of their supposed supernatural power. The Malays imagine that they are endowed with the power of curing every kind of sickness, and of killing an enemy however distant he may be, by the force of spells; and with the gift of discovering mines and hidden treasures. It is not uncommon to

see Malay men and women, at the sight of a Binua Pawang, throw themselves on the ground before him.—*Journ. Ind. Arch.*, Vol. iii, No. 2 Feb. 1849, p. 155.

PAWANNE, HIND. *Clematis nepalensis*; also *Boucerosia aucheri*.

PAWIN, see Kathi.

PAWNEE TRIBE, see Hindoo.

PAYA, NEPALESE. Puddiem tree.

PAYA, see Semang.

PAYANI, MALAL. *Vateria indica*.

PAYASA, in brahmanism, sacred food, consisting of rice and milk. It is prepared at brahmanical sacrifices.

PAYASA-HOMA. A hindu sacrifice with ghi and fire, a hindu sacrifice with rice and milk, but products of the cow are mixed with them.

PAYA-TULLO, HIND. *Beesha rheedii*.

PAYMUSTE, TAM. *Argyrea malabarica*.

PAYA-VERA, MALAL. *Cassia occidentalis*, *Lim.*

PAYSH-QABZ, a particular kind of dagger.

PAYTARA, a large, or Paytaree, a small rattan box.

PAYUDA KHAN, see Khyber.

PAYUNG in Malay and Javanese, and Song-song in Javanese only, an umbrella. Among the civilised nations of the Malayan Archipelago, this is the universal badge of rank from the prince to the humblest office-bearer and stands instead of the crowns, coronets, stars and ribbons of the nations of Europe. The quality of the party is expressed by its size, colour, or material.—*Crawford's, Dict.*, p. 330.

PA-ZAHER-KANI, PERS. Bezoar.

PAZEB, HIND. A foot jewel.

PA-ZEND. The book containing the religious code of the present Parsees is called the Vendidad. It has undergone three various processes of composition of the Avesta, Zend, and Pa-zend. The Avesta is of very ancient date, and is the groundwork of the present

Vendidad, though all of it almost is post-Zertushtrian. In the course of time, several explanations and interpretation of the laws were made, which acquired as much force as the original, and were incorporated with it. This is the Zend, and the incorporation of further explanations was styled the Pa-zend. Avesta means direct higher knowledge, divine regulation. Zend means the explanation of this, and Pa-zend the supplement to the Zend or further explanation of the Zend doctrine. All the three steps exist in the present Zend Avesta, or more properly Avesta-Zend.—*Bunsen*.

PE, HIND. Lahaul, *Picea Webbiana*, *Picea pindrow*, the silver fir.

PE, in the weights of Burmah, is the 1-20th part of a kyat or tikal.

PE, TAM. Wild, uncultivated, a devil.

The pea is grown as a vegetable throughout all the southern and eastern parts of Asia, wherever Europeans reside. It is a well-known leguminous plant, of which two species are commonly distinguished in Britain; the grey field pea, and the white or yellow pea. Of these two species there are many varieties. Leguminous crops are very extensively cultivated in India. The large white, green, and brown, are now the common pea in the Deccan; the latter sort are boiled and eaten often in the shell. Peas may be sown there in the beginning of June, and continued at pleasure until February, when the weather becomes warm and the stalks dry up, although Dr. Riddell had known peas to be had much later in the sheltered gardens in the city of Aurungabad. The method of sowing is very simple; they should not be too thin, or placed deeper in drills than two inches, and a space of three feet between the rows. The first crop in double rows, with a space of a foot between: when they are ready to climb, earth up both sides well, leaving room for the water to run in the middle. Then place good strong sticks in the centre of the rows, and on the outer side of each lay good old manure, after which little trouble is required. Keeping them free from weeds is of course essential, and to preserve the seed, take care and remove any of the plants that appear of a different kind when in blossom; also draw out all the thin and bad-looking plants, to prevent the pollen impregnating the good, and if this seed be the produce of the rain crop, you will find that if sown again in the cold weather they will be

much finer and last longer than the seeds of the former season. For late crops, put down in single rows, and in lines from east to west: this enables the sun to act upon the whole, and tends to prevent mildew from damp on the stalks. In growing crops that you do not intend to stick, it is advisable to put brushwood on one side for them to creep over, and prevent much loss in seed from damp and otherwise. The kinds that grow best at Madras are the Bangalore and Cape seed, sown in drills after the heavy rains are over. The best manure for this vegetable is street sweepings and wood ashes: do little good at Madras after the middle of February. May be sown successively once a fortnight during the cold months. The Japan pea has been introduced into the United States, and returns two and three hundred per cent.—*Agricultural Report for 1854 from Commissioners of Patents to House of Assembly; Faulkner; Rid-dell; Jaffrey.*

PEACH, *Amygdalus persica*.

Khookh, AR. Shaft-aloo. HIND., PERS.
Sien-kwo. CHIN. Aroo.

In the vicinity of Shanghai, is a fine and large variety of peach, which comes into the markets there about the middle of August and remains in perfection for about ten days. It is grown in the peach orchards, a few miles to the south of the City; and it is quite a usual thing to see peaches of this variety eleven inches in circumference and twelve ounces in weight. This is probably, what some writers call the Peking peach, about which some exaggerated stories have been told. Trees of the Shanghai variety are now in the garden of the Horticultural Society of London. In China, Yu-t'au is the nectarine; Ping-t'au and Hoh-t'au are names of the flat peach, and the Kin-t'au is a yellow-fruited peach. The peach was introduced into Europe from Persia, a country in which the fruit is very fine, and where both the free and cling-stone varieties are known, and called kulloo and kardec, the general name for peach, being Persian aroo; and Arabic khookh. They ripen well, and are of a fine flavour in Peshawur; also in the north of India, with the well-flavoured flat peach from China. With care, it succeeds also in the elevated land of Mysore; it is found wild in different parts of the Himalaya, as about Mussooree, at elevations of 5,000 and 6,000 feet. In the district of Bissehur there is a distinct kind, called bhemees by the natives, Persica saligna, Royle, which though small, is juicy and very sweet. The nectarine is found in gardens in northern India, where it is called shaft-aloo, and moondda-aroo (smooth) though it does not perfectly ripen its fruit, nor is it known from whence it was introduced, though probably from Cabul. The apricot is very abundant around almost every village in

the Himalaya rendering it difficult to ascertain whether it be ever found wild, as the trees remain the only vestiges of deserted villages. It has been supposed to be a native of the oases of Egypt, in consequence of its name burkook being probably the original of the old term apricoke and praecocia; but as that is its name in the Arabic language which prevails, like the apricot, over a great extent of the oriental region, the same name is likely to be everywhere applied to it. At Cabul it is said to be preserved in fourteen different ways, with and without the stones, or the kernel left, or an almond substituted. It is generally brought in this state into N. India, under the name khoobanee; the Arabic name is mish-mish; in Bokhara, where they are particularly fine, they are called bakur khanee. In the Himalaya the fruit is called zurd-aloo, choooloo, and chinaroo: in Kunawar the fruit is dried on the tops of their houses, and when pounded, mixed with their meal. It is chiefly cultivated on account of the beautiful oil which is expressed from the kernels. These may also be found in the bazaars, under the name of badam-kohee, or hill-almonds. The oil has a slight smell of hydrocyanic acid, and must resemble that from almonds, especially the bitter kind, or that obtained from *Prunus brigantia*. Of other plants of the same order, the fruit of *Cerasus puddum*, common in the Himalayas, is not edible, but is employed for making a well-flavoured cherry-brandy, though not distilled like the kirschenwasser; the bark, pudmak, is used in medicine, as is that of species of cherry in the United States and Mexico, *Cerasus undulata* and *capricida*, the last so called from the leaves being poisonous to goats; and *C. cornuta* remarkable for its pod-like monstrosity, are handsome and showy trees growing on lofty mountains and worthy of introduction into England. Specimens of the plants from Cashmere appear to Dr. Lindley to be a new species, *Prunus bokhariensis*, Royle. To this kind kokamalis (kokumelca) is applied as the Greek name in Persian works on *Materia Medica*. From Irki, near Sabathoo, a small, yellow, thin-skinned and very juicy sweet plum was introduced into the Saharunpore garden, and which, though considered by Dr. Royle to be a new species (*P. aloocha*), is very like a variety of the common plum. It is this, probably, which is called green-gage by travellers. Mr. Moorcroft, also mentions a plum in Ludak, *Cerasus tomentosa*. The Peach is supposed to be a modified almond under cultivation, and though many hundred varieties have been produced, the Peach and the almond are believed by Professor Koch to be of the same stock.—*Wall. Cat., No. 715; Royle, Ill. Him. Bot., p. 204, 205.*

Tukhi-im,			

There are three species of peafowl known in India, *Pavo cristatus*, *P. japonensis* and *P. muticus*, *Linn.*, the former of British India, the latter from Assam to the Archipelago, confined to Java, Sumatra, and the Malay peninsula, and has never been domesticated by the natives of the Archipelago. The two wild species *P. cristatus*, and *P. muticus* are recognized and Mr. Selater has lately named *P. nigripennis* or Japanned Peacock, but its country is unknown. Peacocks are called in Hebrew tukhi-im, and this finds its explanation in the name still used for peacock on the coast of Malabar, togei, which in turn has been derived from the Sanscrit sikhin, meaning furnished with a crest. In many parts of India, they live in a semi-domestic state in and about the villages. Being deemed sacred they are unmolested. The Peacock is said to have been introduced to Europe by Alexander the Great. Peafowl were so rare in Greece that a male and female were valued at Athens at a thousand drachmæ or £32-5-10. Samos possibly was the next place they were known at, where they were preserved about the temple of Juno, being a bird sacred to that goddess, but their use was afterwards permitted to mortals, for Gellius, in his *Noctes Atticæ*, c. 16, commends the excellency of the Samian peacocks. They were, however, known in Judæa many years before the days of Alexander. The peacock was a favourite armorial emblem of the Rajput warrior; it is the bird sacred to their Mars (Kumara), as it was to Juno, his mother, in the west. The feather of the peacock is used to decorate the turban of the Rajput as that of the warrior of the Crusade, adopted from the hindoo through the Saracens. "Le paon a toujours ete l'emblème de la noblesse. Plusieurs chevaliers avaient leurs casques des plumes de cet oiseau, un grand nombre de familles nobles le portaient dans leur blazon ou sur leur cimier, quelques uns n'en portaient que la queue. A bunch of peacock's feathers is still the implement of conjuring and is carried by mendicants in India who pretend to skill in magic, it is

especially borne about by Jaina vagrants. The peacock enters into the hindoo mythology. Siva, for the amusement of Parvati his bride, originated a particular dance, to the musical accompaniment of the tabor, struck by his attendant Nandi. His sons were present: Kartikeya mounted on his peacock, and Ganesa with the head and trunk of an elephant. Siva is embellished with a collar of the hooded snake twining round his neck and surmounting his head. The peacock is supposed to be particularly delighted by the approach of the rainy season, and the bird of Kartikeya, mistaking the deep sound of the drum for the rolling of thunder indicative of a storm, screams with delight. The peacock is considered the natural enemy of snakes, and the snake of Siva alarmed at the approach of his mortal foe, deserts his place on the neck of the deity, and makes for the first hiding place he can find. This happens to be the tip of the Ganesa's elephant trunk; his entrance into which disturbs the bees that are supposed to settle on the temples of an elephant. The European fable of the jackdaw borrowing the plumage of the peacock, has its counterpart in Ceylon, where the popular legend runs that the pea-fowl stole the plumage of a bird called by the natives avitchia. Sir J. E. Tennent had not been able to identify the species which bears this name; but it utters a cry resembling the word matkiang! which in Singhalese means "I will complain." This they believe is addressed by the bird to the rising of the sun, imploring redress for its wrongs. The avitchia is described as somewhat less than a crow, the colours of its plumage being green, mingled with red. The wild pea-fowl of the jungles is a better bird for the table, and when young is no despicable food.—*Crawford's Dictionary*, p. 330; *Darwin, origin of species*; *Muller's Lectures*, p. 190; *Tod's Rajasthan*, Vol. i, p. 137; *Hind. Theat.*, Vol. ii, pp. 10, 306; *Tennent's Nat. Hist.*, pp. 244. *Art. Armoirie, Dict. de l'ancien Regime*; *Pennant's Hindoostan*, Vol. i, pp. 211, 212. See Sacti, Vahan.

In Arabic poetry pearls are fabled to be drops of vernal rain congealed in oyster shells. Benjamin of Tudela says that in the month of March the drops of rain water which fall on the surface of the sea, are swallowed by the mothers-of-pearl, and carried to the bottom of the sea, where being fished for and opened in September, they are found to contain pearls. The hindooes poetically describe them as drops of dew falling into the shells when the fish rise to the surface of the sea in the month of May, and becoming by some unexplained action of the sun's rays transformed into pearls. Pearls are produced when the transparent envelope of the animal, called the mantle, is wounded or irritated. There are small, boring worms, which pierce the shell and penetrate to the body of the animal. The mantle then sends forth a quantity of pearly matter over the wounded spot, and this becomes a little knob 'or pearl. It appears probable also that some minute substance, such as a grain of sand, may find its way into the shell and produce irritation, and that the animal, unable to expel it, renders it less injurious by covering it with calcareous matter. It is sometimes affirmed, that to produce pearls, the oyster must have received some external injury: and this is corroborated by the fact that nearly all the shells in which pearls are found are outwardly contorted, and that a smooth regular shell is a pretty sure sign of the absence of the pearl. It was therefore suggested to the Swedish government by the celebrated Linnæus, to pierce small holes in the shell of the freshly caught pearl oyster, and then restore it to its original bed. The experiment was tried, but without success. A somewhat similar plan is said to be adopted by the Chinese, and with favourable results. These ingenious people thread upon fine silk small beads of mother-of-pearl, and fasten them within shells of pearl oysters, when they rise to the surface of the water at the beginning of summer. The animals are then restored to their bed, where they soon cover the beads with calcareous matter, and thus convert them into pearls. Small pearls which have been immersed in acetic acids, and thus reduced to their membranous constituents, have the appearance of being formed of concentric coats of membrane, and carbonate of lime, thus resembling in composition the mother-of-pearl with which oyster shells are lined. Mr. Robert Garner, F. L. S., particularly examined those formed in the mantle of the Conway and Lancashire mussel,—not the beautiful pearls of the Alas-

modon, from the upper Conway at Llanrwst, but those of the salt-water mussel: and he attributes the same origin to all pearls, the oxidation of a minute species of *Distoma* causing their formation, much in the same way that galls are formed in plants. In whatever way produced, pearls of considerable size, on account of their beauty and rarity, have been valued at enormous prices in past ages, and are still among the choicest objects of the jeweller's art. Their delicate and silvery lustre has been as widely celebrated as the brilliance of the diamond. The *Meleagrina margaritifera* furnishes the finest pearls and finest nacre. When secreted in the globular form it is the pearl, on the inner walls of the shell—the nacre. The pearl oyster is met with in the Persian Gulf, Arabian coast, the Japanese and American seas, on the shores of California, Australia, near the islands of the South Seas, Bay of Bengal, Ceylon, Gulf of Manaar, and near the mouth of the Indus. The *Meleagrina margaritifera*, or pearl mussel multiplies by means of what is technically called spat or spawn, which is thrown out in some years in great quantities—perhaps similar to the edible oyster of Britain which threw much spat in 1849, and not again until 1860 and not then up at least to 1866. The "spat" floats in and on the water and attaches itself to anything it comes in contact with, attaining it is said the size of a shilling in six months. In its seventh year, the pearl mussel attains its maturity as a pearl producer, pearls obtained from a seven year mussel being of double the value of those from one of six years of age. In mussels under 4 years the pearls are not of any mercantile value and after 7 years the pearls deteriorate. Those from mussels of about 4 years old have a yellow tinge and the older kinds a pinky hue, but pearls of a red and even black as also with other colours are likewise met with. The Baghdad dealers prefer the round white pearl. Those of Bombay esteem pearls of a yellow hue and perfect sphericity, while other nations choose the gems with a rich pink colour. There seem reasons to believe that the pearl mussel spat is migratory, forming colonies at places remote from the parent bed. Between the years 1732 and 1746, there was little pearl fishing at Ceylon and there were long suspensions between 1768 and 1796: between 1820 and 1828: and between 1837 and 1854. The late Dr. Kelaart is stated to have been of opinion that the molluscs are capable of leaving their shell. In the Persian Gulf, the pearl banks extend three hundred miles in a straight line and the best beds are level and of white sand overlying the coral in clear water and any mixture of mud or earthy substance with the sand is considered to be detrimental to the

pearl mollusc. In the Persian Gulf, there is both a spring and a summer fishery and as many as 5,000 boats will assemble from Bahrein and the islands, and continue fishing from April to September. The amount of money derived in the pearl fisheries of the Persian Gulf, has been estimated at £400,000. The net revenue from that of Ceylon, from 1828 to 1837 was £227,131. Each Ceylon boat is manned with a crew of 23 persons, ten of whom are divers, two divers to each stone, of which there are 5 in the boat. When fishing for government or for a speculator, these receive three-fourths of all the produce. Pearls in some instance, though full of lustre without, are dead like a fish eye within, and vice versa. They occur of all colours, those of Asia, from the sea pearl oyster *Meleagrina margaritifera*, are found on the West Coast of Ceylon, in the gulf of Manaar, in the Persian gulf, in the Sooloo islands, near Papua and in the Red Sea. Off the coast of Ceylon, the fishing season is inaugurated by numerous ceremonies, and the fleet, sometimes of 150 boats, then put to sea. Each boat has a stage at its side and is manned by ten rowers, ten divers, a steersman and a shark charmer (pillal karra). The men go down five at a time, each expediting his descent by means of a stone 20 to 25 lbs. in weight, and holding their nostrils, gather about 100 shells in the one or two minutes which they remain under water. Each man makes 40 to 50 descents daily. The pearl oysters are thrown on the beach and left to putrify. In the Persian gulf, so many as 30,000 persons are said to be employed in the pearl fishery. According to European taste, a perfect pearl, should be round or drop-shaped; of a pure white, slightly transparent; free from specks, spots or blemish and possess the peculiar lustre characteristic of the gem. In India and China, the bright yellow colour is preferred. Cleopatra is said to have dissolved in vinegar, a pearl of the value of 150,000 aureos or golden crowns in the presence of Anthony and to have drunk it off, but it would have required a larger quantity and stronger acid than any one could have taken with impunity, to have done so. Cæsar is said to have paid a sum equal to £50,000 sterling, for a single pearl. The fellow-drop to the pendant destroyed by Cleopatra, is said to have been sawn in two by command of the emperor Augustus, and used to adorn the statue of Venus.

The pearls of Scotland, of the best kind, range in price from £5 to £50, but £100 has been paid for a fine specimen. A pearl is found in every thirteen shells, but only one in ten is saleable. The rose tinted pearl of Scotland is in large esteem amongst Paris ladies. Pearl fisheries

exist in Ceylon, on the Coromandel coast, and in the Persian Gulf, the last-named being the most productive. Fisheries of less importance also exist in Algiers, and in the Zooloo islands. In Northern Queensland in 1873, a fleet of sixty schooners was engaged in the remunerative work of raising the mollusca, and one vessel alone realized in six months £3,000, the divers having raised 80 tons of pearl shell, and found over 150 pearls of large size. Two thousand years ago, the Romans found pearls in Britain, and in modern times the rivers of Scotland have afforded considerable quantities, though not of the best quality. Several rivers of Saxony, Silesia, Bavaria and Bohemia afford pearls, and they are also found in two or three Russian provinces. There are also pearl fisheries in the western hemisphere. The coast of Columbia and the Bay of Panama have furnished considerable quantities, but they are not considered equal to the pearls of the East in shape or colour. Pearls are found in China; and Marco Polo speaks of a salt lake, supposed now to be in Yunan, which produced them in such quantity that the fishery in his day was farmed out and restricted lest they should become too cheap and common, but such is not now the case judging from the numbers annually imported from India. The Quarterly Review speaks of an artificial mode practised by the Chinese of making pearls by dropping a string of small mother-of-pearl beads into the shell which in a year are covered with the pearly crust. Pearls, to the amount of £500,000, are annually brought to Canton; coral is also a part of cargoes from the Archipelago to China. The principal pearl fisheries are on the Coast of Madura, the Strait between Ceylon and the Continent, the Island of Bahrein, in the Persian Gulf, and at Hainan, on the Coast of China. The pearl divers pile the shells upon the shore in little pits, and cover them with sand, till the shell opens, and the fish is destroyed. The pearls are then procured, cleansed, and passed through a kind of sieve, according to their sizes: the smallest are denominated seed or ounce pearls, and are of very inferior value. The quality or value of pearls depends chiefly upon their size and colour. Their true shape is a perfect round. The colour should be a pure white; not dull and lifeless, but clear and brilliant; free from foulness, spot, or stain; surfaces naturally smooth and glossy. The shell, which has the mother of Pearl, is compressed and flat, nearly orbicular; the inside exquisitely polished, and of the whiteness and water of the pearl itself. It has the same lustre on the outside, when the external coats have been removed by aquafortis. It is used (especially by the Chinese and Japanese) in a variety of in-laying works, toys, &c.

Pearls worth fishing are found in the seas about the Arro Islands, and in those of the Sulu Archipelago, but none in size or quality to be compared with those of the Manar or Persian gulfs. Mother-of-pearl oysters are found in the same situations and on the coast of several of the Bisaya islands of the Philippines much more abundantly. From Manilla there are yearly exported about £200,000 pounds worth of them. In the Arro Islands on the coast of New Guinea, the great sources of wealth are the pearl and tripang banks, which lie on the eastern side of the group, and are often several miles in width, being intersected by deep channels some of which will admit vessels of burden. The pearl oysters are of several varieties; first, the large oyster with its strong thick shell from six to eight inches in diameter which furnishes the mother-of-pearl shell of commerce. These are obtained by diving and are highly prized, being nearly always in demand at Singapore for the European and Chinese markets. This oyster produces few real pearls, but gnarled semitransparent excrescences are occasionally found on the surface of the inner shell, which are so highly esteemed by the Chinese that they often fetch enormous prices. The other description is the small semitransparent pearl oyster, having the inner surface of the shell of a bluish tint. The shell is of small value as an article of commerce, but the oyster itself often contains pearls which although individually of no great value, are so numerous, as amply to repay the labour of collection. Pearls of sufficient size to undergo the process of boring are sometimes found, but the greater portion are what go by the name of seed pearls, and are only marketable in China, where they are much valued as a medicine when pounded and mixed with some liquid. The names for the pearl in Malay and Javanese, *mute*, *mutya*, and *mutyara*, are all Sanscrit, and it is not known that in any of the Malayan languages there are native names for it. Occasionally the Persian word *lulu* is used. The name for the mother-of-pearl oyster, *indung-mutya*, is exactly equivalent to our own, for the Malay word *indung* signifies mother or matrix. From this we may suppose that both the pearl and mother-of-pearl were most probably made known to the Malayan nations by the hindoos. It may be remarked, that the pearl-fishing of the Sulu islands was certainly carried on before the arrival of Europeans, for they are mentioned by the indefatigable Barbosa. "Going on," says he, "in a northerly direction towards China, there is another island abounding in the necessaries of life called Solar (Sulu) inhabited by a gentile people almost white, and in person well made. They have their own proper king. and lan-

guage. In this island is found much gold by washing the soil, and over against it, the people go to fish small pearls, and even find occasionally larger ones, fine as to colour, and roundness."

Mankind had probably no sooner taken to the use of oysters as food than pearls were discovered and at no period could they be so rude as not to prize the beautiful animal gem: hence in the most ancient records which have come down to us we find the pearl enumerated amongst precious articles. *Job xxviii*, *Prov. iii*. In China, so early as twenty-two and a half centuries before the christian era, pearls are enumerated as tribute or tax: and at a later period they are mentioned in the *Rh-ya* (the most ancient of dictionaries compiled more than ten centuries before our era) as precious products of the western part of the empire. They are also mentioned as ornaments and as amulets against fire, &c. When western naturalists, adhering to Pliny, taught that the oyster produced pearls from the heavenly dew on which it fed, a Chinese writer plainly states that pearls are the result of discoloration in the shell. Fresh water pearls were first in use in China, but soon after the commencement of intercourse with the continent of the Indian ocean they doubtless got them from thence in greater abundance. It was very early that official intercourse first took place. The Emperor Wuh (140-86 B. C.) sent to the sea for the purchase of pearls. After the introduction of buddhism and when intercourse with India became more common, pearls were also frequently referred to in buddhist writings as 'Moni pearls.' From one of these Moni pearls, the product of a dragon's tail, sufficient light was emitted to a cockatrice. A strange but not incredible story is given (806 A. C.) of a pearl as large as a pear which retained its lustre only three years, the result doubtless of molecular changes. Amongst the pearls of note is one of Japan as large as a hen's egg of remarkable lustre by night; of another sent to court in the middle of the eighth century of extraordinary brightness like that of the moon; and of another three inches seven-tenths in circumference which, with several others was sent up from Fokien probably derived from Ceylon. A curious account is recorded of an embassy sent in 1023, A. C., from Shiloch-ayenthoh by the king of Chinlien by his ambassador named Puyah-toil and others with presents of a cup and saucer and of a quantity of true pearls: and thirty or forty years later tribute bearers again came from the same court and solicited that in their audience they might be permitted to follow the customs of their own country which was graciously accorded. On the day appointed, the messenger appeared at the door of the audience

chamber kneeling and holding a golden tray containing pearls and golden figures of the water lily, and on approaching the throne they tossed the contents on the floor before the emperor which the courtiers instantly swept up and divided. They are noted as the most deferential of people. They must have been from some country which then existed in India or Ceylon or thereabouts. Marco Polo also mentions pearls in his work on China. At what period the Chinese fishing for pearls commenced cannot be ascertained except perhaps by reference to local topographical works which it is very difficult, nay almost impossible, to obtain. One account represents pearls as being found on the coast generally south of Canton. No particulars are given except of the fishery in the department of Lien-chan in the extreme southern part of the empire in the Canton province (Kwantung.) On the sea is an island on which there is a pool or lake which the district magistrate annually visits to receive the tribute; personally inspecting the operation. The pearl fishers dive into the lake for shells. The old shells are opened for pearls. The bottom of this lake is supposed to communicate with the sea—unfathomable in the centre—the crater probably of an extinct volcano; pearls as large as beans, sometimes an inch in circumference have been found. The young shells are strung on a bamboo stick and dried in the sun mixed with cassia: then roasted in some medicinal production: they contain pearls as large as millet, thus the womb of the shell is the flesh, either of the large or small kinds. Another account names the district in Lien-chan where the pearl fisheries are conducted. In the sea there is an island with a lake into which the barbarous natives dive for shells: some years they are abundant and in others scarce. There is a myth amongst the fishermen, of a walled city at the bottom, guarded by monsters, containing pearls of large size and splendour but which cannot be obtained for fear of the guards; small ones growing outside the city walls like grass being the only ones obtainable. Another writer says, south-east of the Too city there is a smooth river with a sea (an island with a lake), Yuenmei river, containing large oysters having pearls. Visited by moonlight fishermen descend into the waters with a basket fastened to their waists: when they can hold their breath no longer they give a signal to be brought up. Voracious fish sometimes attack the divers when the rope floats upwards. Yung-tai-kei when at Canton appointed a Pearl-Inspector. The fishers would collect several baskets of sea plants, something similar to the willow which they detached from the rocks under water and brought them to the office. On the middle of

these bushes were shells which contained pearls. Another writer says the rude sea people at Canton dive for pearl shells and cut them out; they leave their sea vessels in which they live and take to boats and then with a rope about the waist descend into the water; when they require breath they make a signal and are aided up. It is stated that between 1403-25, in consequence of so many of the divers being devoured by the sand-fish (shark) or nothing left but their limbs, the fishers contrived an iron rake for gathering shells without diving, but they got a few only. Afterwards they contrived the method now pursued of a dredge or a scoop-like implement one on each side of the boat which as the boats sailed along gathered the shells." The above remarks are gathered from old native authors, but it is not likely that the pearl fishery exists at present at all in China, the places being exhausted as many others have been elsewhere. Were they now in existence they could hardly have escaped the notice of foreigners resident at Canton. These ingenious people were the first to devise methods to imitate the pearl. There is a note that at the commencement of the seventh century pearls were made of a composition of medicine. The art may have been lost or it may be the same as that now employed at, and which originated, at Canton, and which appears to resemble that pursued by the French, who however have carried the art to a very much superior degree of perfection.

Feeling much interest as to the method pursued by the Chinese with the Pearl Mussel in the winter of 1851-52 (in conjunction with a friend,) Dr. McGowan, an American Physician resident at Ningpo by whose assistance he has been enabled to put together the preceding data, the writer dispatched an intelligent native to Hoochow in the adjacent province about three days journey from Ningpo, where the manufacture of artificial pearls, &c., by means of the muscle fish is carried on to a great extent, and he succeeded in obtaining shells shewing the process during the different stages and also some live fish the first ever seen by foreigners. The fish are collected together in April or May and are opened principally by children who put a small bit of bamboo in the orifice: the elders then insert whatever they wish. The foreign substance made use of is composed of brass, bone, pieces of round pebble or mud. When the latter is used it is first well powdered, after which the pitch or juice of a tree is mixed with it to give it solidity. These are put indiscriminately into the mollusc and require nothing to keep them where they are placed, indeed it would appear that the molluscs have no power of themselves to reject anything which may be placed in them. After the fish have

been operated upon, three spoonfuls of the scales of a fish, well powdered and mixed with water, are put into the smaller ones and five spoonfuls into the larger ones, the pieces of bamboo are then withdrawn and the fish are placed carefully in the ponds at a few inches apart. Some of the ponds being small will hold only about 5,000 fish but the larger ponds contain a far greater number. The water in the ponds does not require to be deeper than from three to five feet and in dry seasons water is occasionally worked with them from the canals which intersect the country in every direction for the irrigation of the land. Four or five times each year the ponds are well manured with night soil. The fish are generally taken out of the ponds after ten months, but if allowed to remain a longer time they come to greater perfection, three years being considered the maximum time. Several millions of these shells annually find a market at Hoochow; the price varies considerably, some being worth a penny the pair while others readily fetch eight pence the pair. The greater portion of the shells are sold to the dealers as they are taken out of the ponds but the Hoochow people prepare some few themselves and the price of each pearl or image ready for use is from one farthing to four pence. The shell is cut through with a fine saw as close to the pearl as possible the bit of shell which remains attached to the pearl is then removed as well as the brass, bone or whatever may be inside of it, white wax being substituted and at the extremity a piece of the shell is again placed so as to render the pearl as perfect as possible. There are only a very few pearls of the best description which no doubt arises from the haste in which the Chinese force them upon the market. It is several years since the attention of foreigners at Ningpo was drawn to the mussel pearl and previous to the discovery, most persons imagined the articles resembling pearls which the wealthy natives wear so prominently on their caps were real and valuable gems. The production of the artificial pearls is quite a trade in the neighbourhood of Hoochow whole villages being engaged in it: indeed it is stated that some 5,000 people find a livelihood by these means. The process was first discovered by Ye-jin-yang, a native of Hoochow, A.D. 1200, 1300. At his death a large temple was erected to his memory at a place called Seaou-shang about twenty-six miles from Hoochow. This temple is still kept up and plays are performed there every year to Ye's honour. A book is extant which contains every particular connected with this interesting subject but it could not be purchased. Mention of the art is made in the book of the district and of its producing an important article of

commerce. The trade is a monopoly amongst a certain number of villages and families and any other village or family commencing it is required to pay for some plays at Ye's temple and likewise to subscribe something towards the repair of the temple. The Chinese in the south of Canton, also manufacture artificial pearls: the two provinces it is stated having exchanged their secrets many years ago, but the Hoochow people do not succeed very well with the Canton process, and there must be some very great peculiarity in either the climate or fish as it does not appear that the Canton people who are so noted for their perseverance with anything by which they can earn even a trifle have ever succeeded with the Hoochow method. From the circumstance of the trading junks both from the northern and southern provinces buying up all they can meet with in the shops at Ningpo, it would seem as though Hoochow was the only place in China where the trade is pursued. An extensive pearl fishery exists on the north-west coast of western Australia, extending for 1,000 miles along the coast. Pearls obtained from the banks at Perth are valued from £1 to £20 each. The pearl fisheries of western Australia appear to be still progressing favourably. One consignment to Melbourne from the banks consisted of twenty-five very handsome pearls, some of them perfect in shape and of a very fine colour. The largest were valued at £15 for the London market, the others at prices ranging from £8 to £15.

The Arabs of the Persian Gulf, according to Colonel Pelly, attribute the decay of the Sind and Ceylon fisheries to the mixture of mud and earthy substance with the sand of the beds. A late return from the Bahrein pearl fishery values the produce at twenty lacs of Rupees, and the other fisheries in the Persian Gulf yield an aggregate of other twenty lacs. Colonel Pelly suggested that a few hundred oysters from the Gulf should be transported to the Ceylon coast as an experiment. If the oysters survived and prospered, the Ceylon banks might be again stocked from the Gulf.

The mother-of-pearl oyster also abound, in the Sooloo Archipelago, and the pearl fishery of the Sooloo islands has been long known and highly valued: in proper hands it would be the finest in the world; but pearls are produced in plenty all along the northern coast.

Pearls, by the Japanese called kainotamma which is as much as to say, shell jewels, or jewels taken out of shell, are found almost everywhere about Saikoko in oysters and several other sea-shells in Japan, and Thunberg relates that the natives had little or no value for them till they were apprized of it by the Chinese who would pay good prices for them, the Chinese women being very proud of wearing neck

laces, and other ornaments of pearls. The largest and finest pearls are found in a small sort of oyster, called Akoja, which is not unlike the Persian pearl-shell, much of the same shape, both valves shutting close, about a hand broad, exceeding thin and brittle, black, smooth and shining on the outside, within pretty rough and unequal, of a whitish-colour and glittering like mother-of-pearl. These pearl-shells are found only in the seas about Satzuma, and in the Gulf of Omra. Some of the pearls weigh from four to five condonins, and these are sold for a hundred colans a piece. The inhabitants of the Riuku islands buy most of those, which are found about Satzuma, they trading to that province. Those on the contrary which are found in the Gulf of Omra, are sold chiefly to the Chinese and Tunquinese, and it is computed that they buy for about 3,000 thails a year. He says that there is another shell, which sometimes yields pearls, found plentifully upon all the Japanese coasts, and called by the natives Awabi. It is an univalve in shape almost oval, pretty deep, open on one side, where it sticks to the rocks and to the bottom of the sea, with a row of holes, which grow bigger, the nearer they come to the circumstance of the shell, rough and limy on its outward surface, frequently with corals, sea-plants and other shells sticking to it, on the inside of an exquisite mother-of-pearl glimmering, sometimes raised into whitish pearly excrescencies, which are likewise observed in the common Persian pearl-shell. A great lump of flesh fills the cavity of this shell, for which sole reason they are looked for by fishermen, being a very good commodity for the market. They have an instrument made on purpose to pull them off from the sides of the rocks, to which they stick close. Another shell, the name of which he could not learn, yields a very large pearl, which sometimes weighs from five to six condonins, but they are of a dirty yellow colour, ill-shaped, and worth but little. A pretty good sort of pearl, is sometimes observed to grow in the very flesh of a shell, which is called by the natives Tairaggi, and is found in the Gulf of Arima, between Janagana and Isafaje. It is a flat sort of a shell, oblong, almost triangular, a little crooked on each side, about a span and a half long, and a span broad, where broadest, thin, transparent, smooth and polished like horn, but very brittle.

Pearl-fishing is carried on at the Ceruo islands.

Pearl fisheries are, from time to time, undertaken on some points of the coast of the island of Mindanao, and some of the smaller ones, not far from that of Zebu, but with little success and less constancy, not because there is a scarcity of fine pearls, of a bright colour and con-

siderable size, but on account of the want of skill in the divers, and their just dread of the sharks, which, in great numbers, infest these seas.

Pearls are fished up on nearly all parts of the Ceylon coast and are frequently large and beautiful, but the pearl fisheries for which the island is still famous have very much varied in their yield. The natives account for the diminution by declaring that the pearl oyster has the power of locomotion and has shifted its former quarters to some new ground not yet discovered. The scarcity is probably owing to the fact that the pearls have been disturbed before they have reached their full development which is said to require a period of seven years. Among the natives of Ceylon, a skilful diver can earn ten times the wages of a farm labourer. Detailed accounts of the pearl fishery of Ceylon have been given by the Count de Noe and others, who have had ample means of watching the operations of the pearl-divers during a residence in that island. The pearl oysters occur in banks at greater or less depth in the sea on the western side of the island of Ceylon, the average depth, however, being about 12 fathoms, and the distance from the shore about 15 miles. The right to fish on these banks is sold by the government every season, generally to one individual, who afterwards disposes of shares in the fishery to other parties. The bid-dings at the auction are regulated by the produce of some thousands of oysters taken from the beds at hazard. If the average quality of pearl contained in them be good, the competition is strong in proportion. The pearl fishery commences in April and lasts till towards the end of May. It attracts a concourse of visitors not only from the interior of the island, but from various parts of India, whose diversities of language, dress, and manners produce a striking effect. The sea-shore, at other times solitary, is, on the eve of the fishery, suddenly covered with innumerable huts, composed of a few poles stuck in the ground, inter-woven with bamboo and covered with the leaves of the cocoanut palm: these temporary dwellings often shelter as many as 150,000 persons. The signal for commencing the fishery is given at day-break by the firing of cannon, and at that moment the several boats cast anchor in the fishing ground, for at midnight they had left the shore in an extensive fleet, so as to be on the spot at the desired moment. Each boat has its own proper bounds, beyond which it is not lawful to work, and government vessels are on the spot to see that no infringement of contract takes place. The boats each carry a captain, a pilot, and 20 men, of whom 10 are experienced divers. Five divers descend at once, the other 5 taking the plunge when the

first ascend. Thus a little time is allowed for regaining strength. In order to descend as rapidly as possible through the water, the diver places his feet on a large stone made fast to one end of a rope, the other end being secured to the boat. He also takes another rope, to the end of which is attached a net, or basket, to contain the oysters. The upper extremity of this second rope is held by two men in the boat. The diver is also provided with a strong knife for detaching the oysters, and as a means of defence against sharks, which are very numerous in those seas, but which do not often attack the divers, being perhaps scared by the noise of the assemblage, and the continual plunging of so great a number of persons. The diver no sooner reaches the ground than he gathers oysters with all possible speed into his basket, and then letting go the rope to which the stone is attached, he pulls that which is held by the sailors, and rapidly ascends to the surface. Some divers make very dexterous use of their feet, holding the net with one foot, clasping the stone with the other, and thus leaving one hand free to close the nostrils, while the other hand holds the rope in descending. The time during which the divers can remain submerged is variously stated, and no doubt it differs greatly according to the constitution of the individual. Some observers declare that in their experience it never exceeds 50 seconds; but Captain Percival, in his work on Ceylon, gives two minutes as the usual time of remaining under water. The longest authenticated period which a diver has remained below water, is 87 seconds, and the greatest depth attained is 78 feet—but 57 seconds and 54 feet are the ordinary efforts. Faraday found that by first exhausting the lungs, by several deep exhalations, so as to expel the carbonic acid, and then taking a deep inspiration of fresh air, he was able to hold his breath for two minutes and a half. Serious effects are produced by this employment, and the divers may frequently be seen with blood issuing from their mouth and nostrils. Yet this does not hinder them from going down in their turn. They will make from 40 to 50 plunges in one day, and bring up on each occasion about 100 oysters. Their day closes before noon, for as soon as the sea breeze sets in, the signal is given for the return of the boats to the shore. Their owners, and a large assemblage of persons of all classes, are eagerly looking out for the arrival of the flotilla, and are soon busily employed in examining and stowing away the cargoes. Each owner has a shallow pit fenced round and secured for his own use, in which his store of oysters is deposited, and left open to the air. This pit, or *coutto* as it is called, is in the midst of a group of huts belonging to the same owner, so that it

is under the guard of his party. Here the oysters are allowed to putrefy under a burning sun, and a stench arises from them which would seem enough to depopulate the shore of its thousands of inhabitants. Yet such is not the case. The health of the people does not appear to be materially affected, and the oysters are allowed to remain till dry, when they can be easily opened and the pearls extracted. To open them when fresh would require much greater force, and would be likely to injure the pearls. When the putrefaction is sufficiently advanced, the oysters are taken from the *coutto*, and placed in troughs made of the trunks of trees. Sea water is thrown over them: they are easily opened, and render their pearls to the washing and shaking of a number of men who stand all on one side of the trough, while inspectors at each end closely watch their proceedings, and other inspectors examine the shells which are thrown away, lest they should contain some of the precious substance. The workmen engaged in washing pearls dare not lift their hands to their mouth under penalty of a flogging, yet a man will sometimes contrive to swallow a pearl of high price. After all the pearls are washed out, the largest are carefully picked out from the sand at the bottom of the troughs and washed repeatedly in clean water: the next in size are spread out on white napkins to dry in the sun. The remainder are left to the care of women, who pick them up and dry them. Pearls are assorted by means of three sieves placed one above another, the meshes in which are smaller as the pearls descend. Thus the pearls which will not pass through the uppermost sieve are of the first class, and so on with the others. Another assortment is made as to colour, regularity of form, &c., and here the tastes of different nations have to be consulted. The Europeans prefer pure white pearls, the Indians yellow pearls, and the natives of Ceylon those which are tinged with rose colour. Besides the number of persons who arrive in Ceylon in the fishing season for the sake of speculating in pearls, there are also numerous Indian artisans who are very expert in piercing and drilling pearls, and who practice their trade on the spot on economical terms. Captain Percival thus describes their operations:—"A machine made of wood, and of a shape resembling an obtuse inverted cone, about 6 inches in length and 4 in breadth, is supported upon 3 feet, each 12 inches long. In the upper flat surface of this machine holes or pits are formed to receive the larger pearls, the smaller ones being beat in with a little wooden hammer. The drilling instruments are spindles of various sizes, according to that of the pearls; they are turned round in a wooden head by means of a bow handle, to which they are attached. The

pearls being placed in the pits which we have already mentioned, and the point of the spindle adjusted to them, the workman presses on the wooden head of the machine with his left hand, while his right is employed in turning round the bow handle. During the process of drilling he occasionally moistens the pearl by dipping the little finger of his right hand in a cocoanut filled with water, which is placed by him for that purpose; this he does with a dexterity and quickness which scarcely impede the operation, and can only be acquired by much practice. They have also a variety of other instruments both for cutting and drilling the pearls. To clean, round, and polish them to that state in which we see them, a powder, made of the pearls themselves, is employed. These different operations in preparing the pearls occupy a great number of the black men in various parts of the island. In the black town or pettah of Columbo, in particular, many of them may every day be seen at this work, which is well worth the attention of any European who is not already acquainted with it."

Dr. Kelaart, in his report for 1858, on the pearl banks of Arippe, off Ceylon, advanced the opinion that a species of *Filaria*, which he found within most of the pearl bearing shells, in the liver, ovary, mantle and other parts of the oyster, had much to do with the formation of pearls. He also considered, that the ova of oysters, and of worms form the nuclei of many pearls, according to the doctrine of Sir E. Home.

The mollusc which produces the pearls is not an oyster, but belongs to the genus *Avicula* or *Meleagrina*, the *Meleagrina margaritifera* of Lamarck. Dr. Kelaart has shown that the pearl mollusc, to enable it to migrate for food, can sever its byssus, and reform it, at pleasure, so as to travel and remoor itself in favourable sites. The pearl molluscs make periodical migrations in search of food, and the Arabs were well acquainted with the fact. Albyrouni (a contemporary of Avicenna) who served under Mahmood of Ghuzni, in the 11th century, notices their disappearance from Serendib or Ceylon, and appearance of *Sofala* in the country of Zend, where pearls were before unknown and it was conjectured that they had migrated. The Dutch were unsuccessful in their Ceylon fisheries from 1732 to 1746, and again from 1768 to 1796. An interruption occurred from 1820 to 1828, and again from 1837 to 1854.

Pearl oyster shells are imported into England, from the East Indies, Panama and Manilla: the quantities arriving in Liverpool in five years, being as follows—

1851,	415 tons	1854,	550 tons.
2,	480 "	and	
3,	430 "	1855,	570 "

The art of making artificial pearls has been brought to such perfection in Paris, that even jewellers and pawnbrokers have occasionally had a difficulty in deciding between the artificial and the real. A French bead maker named Jaquin, observing that when the small fish called ablette, or bleak (*Cyprinus alburnus*), was washed, the water was filled with fine silver-coloured particles, collected some of these for the purposes of his trade. He found that the soft shining powder thus obtained had, to a remarkable degree, the lustre of pearls; hence, he called it essence of pearl, or essence d'orient. He first made small beads of gypsum and covered them with this substance: they were greatly admired and eagerly sought after; but it was found that this pearly coat, when exposed to heat, separated itself from the bead, and attached itself to the skin of the wearer, ladies it is said, suggested to Jaquin the making of hollow glass beads, and covering the inside with essence of pearl. This he did, slender tubes of glass are first prepared, called *girasols*; a term applied to opal, and sometimes to the stone called cat's eye, and given to these tubes because the glass is of a peculiar bluish tint. From these the artist blows minute globules, to the extent of from two to six thousand per day, not caring to make them all perfectly regular, or free from blemish, because the natural pearls are not so. The pearl essence is then mixed with a solution of isinglass, and is blown while hot into each bead by means of a fine glass pipe. The solution is spread equally over the whole internal surface, by shaking the pearls in a vessel placed over the table where the workman sits, and to which he gives motion by his foot. When the varnish is equally diffused and dry, the beads are filled with white wax; this gives them the necessary weight and solidity, and renders them less fragile. They are then bored with a needle, and threaded on strings for sale. The holes in the finer sort are lined with thin paper, that the thread may not adhere to the wax. To produce one pound of scales no fewer than 4,000 fishes are required; but this quantity of scales only yields 4 ounces of pearl essence. The fishes are about 4 inches long; they are sold at a cheap rate in the markets after being deprived of their scales. The value of a pound of washed scales in the Chalonais is from 15 to 25 livres. The early manufacturers suffered great inconvenience from not knowing how to preserve the scales from putrefaction, and consequently being obliged to use the essence immediately it was obtained, lest it should acquire the intolerable odour of decayed fish. Attempts were made to preserve them in spirit of wine or brandy, but those liquors wholly destroyed their lustre. At length it was discovered that

these fishy particles can be kept for a long time in solution of ammonia, and this enables the manufacturers of artificial pearls to carry on a considerable traffic with distant places where the fish is plentiful, the supply from the Seine, though abundant, being insufficient for the purposes of the trade of Paris. Down to a late period the heirs of M. Jaquin continued to manufacture pearls to a considerable extent, in the Rue de Petit Lion, at Paris.

The productiveness of the Ceylon pearl fisheries has been very variable—

In 1797	£144,000	In 1804	£120,000
1798	192,000		

The pearl fisheries of Japan, Persia, &c., are valued at £800,000. The oyster banks off the island of Bahrein produce £240,000 and off Arabia £350,000.

In consequence of the falling off of the Ceylon fishery, Dr. Kelaart was appointed to examine the pearl banks and he found that the mussel will leave its old moving place in search of another if the water be agitated to an inordinate degree, or if the water become muddy or impure; that it is gregarious in its habits; that in an aquarium they are fatally affected by thunder storms; that it can live in brackish water, and in places so shallow, that it must be exposed for three or four hours daily to the sun, and other atmospheric influences; that it is more tenacious of life than any bivalve mollusc with which he is acquainted, though about one-third die from being injured by the force necessarily applied when detaching them from the rocks to which they adhere; finally that old as well as young, are in spawn from March to September, and that there is probably no stated period for spawning. He found the whole system of the methods pursued in the fisheries, defective in the extreme; and that it was left to the divers and others to do just as they pleased. The banks were rented from the Government for the season by a contractor whose interest it was of course to make the most of his opportunity, and to leave as little as possible behind. This he did in the following manner. Several scores of boats, each boat being manned by ten divers, he sent to the bank to collect the oysters. The divers went on day by day fishing up the oysters from one end of the bank to the other; this done, a still larger number of boats appeared upon the scene, and the same ground was fished over again, till the divers failed to bring up a remunerative quantity; then the fishery was closed. By this method, the amount of oysters left upon the banks, depended wholly upon the divers' exertion; sometimes it might happen that small patches might remain here and there, at other times that very few oysters were left; the inspectors could be aware of their actual state, only by informa-

tion supplied by the divers, who being in the pay of the contractors, were interested in giving a false account, and thus the government were working in the dark, and ignorant of the injury done to the revenue. Further, all oysters, old and young, little and big, were brought up indiscriminately, and the havoc thus made was frightfully increased by the kicking and splashing of the divers in the water. Heavy anchors, and ponderous stones let fall upon clusters of oysters destroyed many, and examination showed that the mortality wrought by these means was very great. Besides this, the divers clutched at and tore everything before them, and other molluscs, zoophytes, and sea-weeds were left to float about in the water, and decompose to complete the ruin of the bank. Added to this, the fisheries were carried on at no set period, and for many months in the year; in short, a more effectual system could not have been devised if the object had been to put an end to the fisheries altogether, instead of preserving them, and, in point of fact, had choleraic epidemics and other sicknesses been of less frequent occurrence among the divers in the diving season, the majority of the banks would long ago have ceased to yield a single pearl. For the better preservation of the pearl oyster Dr. Kelaart suggested that the fisheries should be held only for two or three months in the year; say April, May and June; that no oyster under a certain size be allowed to be removed from the banks; that portions of each bank should be buoyed, and reserved for breeding purposes; and that government itself should undertake the fishing, and sell the oysters to the highest bidder. Dr. Kelaart also suggested that the French system, which has proved so successful, of placing fascines on oyster beds for the collection of the spawn be adopted, and that each bank be girdled or barricaded with coir-matting supported on iron frames, and placed ten yards beyond the edge of the bed, fascines, corals, and oyster shells being freely deposited between the barricade and the bank. Thus sufficient room will be allowed for the roaming disposition of the oysters, and the impediments thrown in their way will give new surfaces for them to cling to, while at the same time they will form barriers sufficient to prevent the escape of the oysters, and the spawn from being carried away by currents to distant parts of the sea. In this manner old banks can be renewed, and new ones formed to any extent; and since it is impossible to avoid bringing up many millions of young ones, attached to the larger oysters, these should be at once carefully removed, properly cared for, and carried to some favourable parts of the sea, where they will live and grow to perfection; hitherto this course has been entirely neglected.

The market value of a bed of pearl oysters, two miles in circumference is from three to four lakhs of rupees, the cost of fencing it less than three thousand rupees, so that there is much to gain pecuniarily by adopting the barricade system. Oysters are liable to numerous accidents, thousands of voracious marine animals prey upon them; a thin layer of sand is sufficient to destroy a whole bed; and what has happened to the pearl fisheries of the Red Sea may happen at any time, unless precaution is taken, to those of India and Ceylon. A few years ago the edible oyster was growing scarce in France, fascines and fences promptly applied stopped the evil, and now the French oyster fisheries are among the most successful in the country. Dr. Kelaart's suggestions were acted upon to some extent, and the fisheries have been improving. Dr. Kelaart found that the byssus was capable of being formed at the pleasure of the animal, even to the extent of five or six times in the course of a month; during the day the creature remains in a state of rest, but at sun-set its shell opens, and if desirous of changing its site it shakes off its byssus and moves to another locality.

The most extensive pearl fisheries are those of the gulf of Manaar in Ceylon, and Bahrein in the Persian gulf. Pearls are imported into Bombay from the latter place, and are re-exported to England and China, but in all the localities in which the pearl mussel thrives there occur frequent periods in which the mollusc becomes scarce or altogether disappears.

Pearls are designated in Europe by their colours white, yellow, or black, or by their size as seed pearl. The best pearls are of a clear bright whiteness, free from spots or stains, with the surface naturally smooth and glossy. Those of a round form are preferred, but the larger pear-shaped ones are esteemed for earrings. Seed pearls are those of the smallest size.

The dealers in Ceylon, recognize twelve classes, in none of which is the actual weight taken into consideration.

- No. 1, is called Ani, comprising those pearls to which Pliny first applied the term 'unio,' in which all the highest perfections of lustre and sphericity are centred.
- No. 2, Anathari, are such as fail a little in one point, either in lustre or sphericity.
- No. 3, Sanadayam, } Such as fail in both.
- No. 4, Kayeral, }
- No. 5, Massagu, or confusion.
- No. 6, Vadivu, beauty.
- No. 7, Medangu, bent, or 'folded' pearls.
- No. 8, Kurwal, double pearls.
- No. 9, Kalippu, signifying abundance.
- No. 10, Poesal, } 'Mis-shapen.'
- No. 11, Kural, }

These find a ready sale in India, all kinds

and shapes being indiscriminately used to adorn the roughly made breastplates of gold worn by women of high caste.

No. 12, Thool, literally 'powder.' These are all easily disposed of in India, where they are sometimes made into lime for to chew with betel.

About the years 1865, 1866 the pearl banks off Tuticorin were almost nude of the pearl mussel, Captain Phipps examined the Cruchanpar, the Cruchan Tondoo-par, and the Nagara-par and others off Tuticorin, off Vypaur, off the coasts of Madura and Tinnevely and found them almost all bare.

The Tinnevely Pearl Banks.—From time immemorial the pearl fishery in the narrow sea which separates India from the island of Ceylon has been famous in all the marts of the old world, and has rivalled the still more renowned fishery of Bahrein, in the Persian Gulf. Tavernier, the old travelling jeweller, said, in 1651, that the pearls from the sea that washes the walls of Manaar, in Ceylon, are, for their roundness and water, the fairest that are found, but rarely weigh three or four carats. Master Ralph Fitch, a London merchant, who made a voyage to the Indies in 1853, says, on the other hand, that, though the pearls of Cape Comorin are very plentiful, they have not the bright orient lustre that those of Bahrein have. Whatever the truth may be respecting the water and orient lustre of the pearls of these rival fisheries, there can be no doubt that a vast concourse of merchants and others has been annually attracted to the fisheries in the Gulf of Manaar from the most ancient times, which is a sufficient evidence of their value. The Ceylon fisheries have retained their old reputation down to modern times. There are smaller and hitherto less productive pearl banks, on the opposite side of the Manaar gulf, off the shores of the Indian Collectorate of Tinnevely.

In the golden age of the Tamil people of Southern India, the Tinnevely pearl fishery, then established, as Ptolemy states, at Koru, the more modern Coil, paid tribute to the Pandyan kings of Madura; and at this period, we are told by the author of the Periplus of the Erythræan Sea, none but condemned criminals were employed in the fishery. Marco Polo, in the end of the thirteenth century, mentions the land of Malabar, Maabar of Ibn Batuta and Marco Polo, the southern region of the Coromandel coast, comprised in the modern districts of Madura and Tinnevely. Colonel Yule has suggested that the word may be Arabic (Maabar, a ferry), in reference to the passage of ferry to Ceylon, where many beautiful and great pearls are found off the coast. The merchants and dyers, he says, congregate at Beta-

ler, in April and May, and he relates how the divers, called Abraimain, performed incantations to preserve themselves from the attacks of great fish in the depths of thesea. In those days the sovereign received a tenth, and the divers a twentieth of the proceeds of the fishery. The great number of pearls from these Tinnevely banks excited the wonder of all the bold wanderers who completed the perilous voyage to India in early times. Friar Jordanus, a quaint old missionary bishop, who was in India in 1330, says that 8,000 boats were engaged in this fishery and that of Ceylon, and that the quantity of pearls was astounding, and almost incredible. The head-quarters of the fishery was then, and indeed from the days of Ptolemy to the seventeenth century continued to be at Chayl or Coil, literally "the temple," on the sandy promontory of Ramnad, which sends off a reef of rocks towards Ceylon, known as Adam's Bridge. Old Ludovico di Varthema mentions having seen the pearls fished for in the sea near the city of Chayl, in about 1,500 A.D., and Barbosa, who travelled about the same time, says that the people of Chayl are jewellers who trade in pearls. This place is, as Dr. Vincent has clearly shown, the Koru of Ptolemy the Kolkhi of the author of Periplus, the Coli or Chayl of the travellers of the middle ages, the Ramana-Koil (temple of Rama) of the natives, the same as the sacred promontory of Ramnad and isle of Rameswaram, the head-quarters of the Indian pearl fishery from time immemorial.

But Tuticorin, the present head-quarters of the fishery, has supplanted the ancient Coil for the last two centuries; and, since the middle of the seventeenth century, the powers which have successively presided over the fishery, whether native, Portuguese, Dutch, or British, have uniformly taken their station at this little port, which is about ninety miles north-east of Cape Comorin, on the Tinnevely coast. When the Portuguese were all powerful on the coast, the Jesuits were allowed the proceeds of one day's fishing, and the owners of the boats had one draught every fishing day. The Naik of Madura, the sovereign whose family succeeded the ancient Pandyan dynasty, also had the proceeds of one day as Lord of the coast. These Naiks were the builders of all the magnificent edifices which now beautify the city of Madura, and their dues from the fishery were probably used as offerings to Minakshi, the fish-eyed goddess of the vast Madura pagoda, who now possesses, amongst her jewellery, a numerous collection of exquisitely beautiful pearl ornaments. In the days of the Naiks and Portuguese there were 400 or 500 vessels at the annual fishery, carrying sixty to ninety men each, a third of whom were divers;

and at the subsequent fair held at Tuticorin, there was an assembly of from 50,000 to 60,000 persons. The divers, at that time, were chiefly Christians from Malabar. Captain Hamilton, who was travelling in the East from 1688 to 1723, described Tuticorin when the Dutch were all powerful at that port, as well as in Ceylon. He says that a Dutch colony at Tuticorin superintended a pearl fishery a little to the northward of the port, which brought the Dutch company £20,000 yearly tribute.

The Dutch may have fished too recklessly and too often; and, when the British succeeded them at Tuticorin, the banks were very far from yielding £20,000 a year.

In 1822 the Tuticorin pearl fishery contributed about £13,000 to the Indian revenue, and in 1830 about £10,000; but after the latter date there was no yield at all for many years. Between 1830 and 1856 there were thirteen examinations of the banks, and on each occasion it was found that there was not a sufficient number of grown oysters to yield a profitable fishery, and none was therefore attempted. The unsatisfactory condition of the banks was attributed to several causes. Captain Robertson, the Master Attendant at Tuticorin, thought that the widening of the Paumben channel, which caused a stronger flow of current over the banks on the coast, prevented the molluscs from adhering; and that the fishers for large conch or chank shells anchoring their boats on the banks, killed the oysters. The dead oysters would, of course, have a fatal effect on their neighbours. The native divers attributed the state of the banks to the pernicious influence of two other shell-fish, called soorum (a kind of *Modiola*) and kullikoz (an *Avicula*), which are mingled with the pearl oysters on the banks, and, as the natives believe, destroy them.

In 1856, however, an examination was made by Captain Robertson, and it was found that at least four of the banks off Tuticorin, called Cooroochan Paur, Navary Paur, Oodooroovie Paur, and Clothie Paur were well covered with young pearl oysters, which would be old enough to be fished in 1860-61. The Madras government, therefore, determined that every precaution should be taken, in order that the banks might receive no injury during the interval. The chank fishery off Tuticorin was ordered to be entirely put a stop to at the termination of the contract, and vessels were provided to protect the pearl banks from poachers, on board one of which Captain Robertson was unfortunately lost in March, 1859.

Captain Robertson was succeeded as Master Attendant of Tuticorin and Superintendent of the Tinnevely Pearl Banks by Captain Phipps, under whom the fishery of March, 1860, the

first that had been attempted since 1830, was opened.

A Government pearl fishery is a most legitimate source of revenue, for pearls are simply articles of luxury in the strictest meaning of the word; the seas in which they grow cannot well become private property; and, if a profit can be derived from their sale, it is certainly a branch of revenue which can give just cause of complaint to no man, while it benefits the community at large. McCulloch says that the Government monopoly ought to be abolished, because the expense of guarding and managing the banks exceeds the sum for which the fishery is let, and that any one who likes should be allowed to fish on paying a moderate license duty. The last edition of his Commercial Dictionary was published in 1860, and during the two following years the Tinnevely pearl fishery yielded a large nett revenue to the Government, which is a sufficient answer to Mr. McCulloch's argument.

The fishery of 1861 commenced on March 7th, and the sale of the government share of oysters was conducted by public auction, which began at Rs. 15, and gradually rose to Rs. 40 per 1,000. As many as 15,874,500 shells were sold, realizing upwards of £20,000, as the nett result to government, exclusive of all expenses, and of the shares allowed to the divers. The annual expense of the guard boats for protecting the banks is only £500.

In 1862 the results of the fishery were also satisfactory; but in 1863 the banks were found to be in a most unpromising state, and no fishery was attempted. Out of seventy-two banks that were examined, only four contained oysters free from soorum, eleven had young oysters mixed with soorum, and fifty-seven were blank, this unexpected failure of properly grown shells gave rise to Captain Phipps' experimental culture.

The pearl banks are about nine miles from the shore, and 8 to 10 fathoms from the surface, being scattered over an area 70 miles in length. They are exposed to ocean currents, which, by washing sand into the interstices of the rocks, often destroy the young oysters, over a considerable area; the dead fish, when not removed, soon contaminate their neighbours; and, in addition to these sources of evil, the soorum shells, a species of *Modiola*, like a mussel with a swollen face, which often grow amongst the pearl oysters, exercise a pernicious influence, either by dying or spreading death around them, or by accumulating sand. It is obviously quite impossible to watch these banks efficiently, and to eradicate the evils caused by sand accumulations and dead molluscs, owing to their great depth and exposed situation in the open sea at a distance from land. Unless

some plan is adopted for rearing the young fish on banks which shall be constantly accessible, and free from the above drawbacks, the fishery will always be liable to failures, sometimes of long duration. The perfection to which science and intelligent care have brought the fisheries of edible oysters on the English, and especially on the French coasts, leaves no doubt that equally satisfactory results might be obtained from similar measures on the Tinnevely pearl banks.

The pearl oyster (*Meleagrina margaritifera*, Lam.) has a byssus, or cable, by which it secures itself to the rocks—one of the most important points in its organization. The animal's foot is composed of muscular fibres, and is 2½ inches long, when distended. On the lower side there is a groove lined by a secreting membrane, which is an exact mould for the formation of the byssus. When the animal desires to attach itself to the rock, its foot is protruded, and, after seeking out a suitable spot with the tip for some minutes, is again retracted into the shell. A strong fibre, of the form of the groove in the foot, is thus left, attached to the base of the foot at one end, and to the rock at the other. The process is again and again repeated until a strong cable is formed; and it was one of the most important results of the careful investigations of Dr. Kelaart in Ceylon, that the power of the animal to cast off its byssus at pleasure was ascertained. It leaves it behind to make another in a more convenient place, like a ship slipping her cable and going to sea. From this ability to shift its berth it follows that the pearl oyster might safely be taken from its native beds, and made to colonize other parts of the sea; and also that it would move of its own accord if the surrounding water should become impure or sandy, or when there is an influx of fresh water. The animal can reform the byssus at pleasure, if in good health and condition.

Pliny and Dioscorides believed that pearls were productions of dew, but that observant old Elizabethan navigator, Sir Richard Hawkins, shrewdly remarked that "this must be some old philosopher's conceit, for it cannot be probable how the dew should come into the oyster." Modern investigation had suggested various causes for the intrusion of the nucleus round which the pearl is formed. The free border of mantle lining each valve of the shell dips downwards to meet a similar edge on the opposite side, thus forming a double-fringed veil. The tentacles of this fringe consist of long and short flat filaments, which are exceedingly sensitive, so that even the approach of a foreign substance makes them draw forwards and shut out the intruder. They doubtless prevent the pearls from dropping out o

the shell, and preserve the fish from the host of carnivorous creatures which infest its place of abode; and if it be true that particles of sand form the nuclei of pearls, they must run the gauntlet of these ever-watchful sentinels before they can intrude themselves amongst the interstices of the mantle. The food of pearl oysters consists of foraminifera, minute algæ, and diatoms; and Dr. Kelaart has suggested that the siliceous internal skeletons of these microscopic diatoms may possibly permeate the coats of the mantle and become nuclei of pearls.

Lastly, the ova which escape through the distended coat of an overgrown ovary may, perhaps, become embedded in the interstices of the mantle, and become the nuclei of pearls, especially as pearls are usually found embedded in the mantle near the hinge, where the ovary is most liable to rupture. Large pearls often work their way out of the mantle, and lie loose between it and the shell, or become attached to the surface of the latter. They have even been found outside the shell altogether entangled amongst the strands of the byssus. The causes leading to the formation of pearls, are as yet imperfectly understood. The chief external difference between the pearl and edible oyster is, that the former secures itself to rocks and stones by means of a byssus, while the latter merely lies flat on the ground on its convex side; but there is no reason why the pearl oyster should not thrive on artificial banks as well as the edible oyster. In the Colne oyster fishery, the brood (oysters two years old) are dredged up out at sea, and placed on "layings" within the river Colne. These "layings" are about 100 or 150 yards by 80, according to the breadth of the channel, most of them dry at low water, and they are paved with stones, old shells, and any other hard substances, to a depth of a few inches, so as to form a bed for the oysters, which would be choked in soft mud. This material is called culch. In France, M. Coste adopted a system of placing fascines on the layings, instead of culch, as resting places for the oysters; but the natural advantages of the ground render any artificial method of this kind unnecessary in the Colne. It is very important that the culch should be kept perfectly clean and clear of mud, and above all, that every mussel-shell should be weeded out. The mussels have a remarkable tendency to collect mud round them in heaps, probably owing to their elongated shape, and if they are allowed to remain on the layings, there is danger of the oysters being choked with mud. The oysters remain on the layings for two years, when they are fit for eating, and during this time there are constant examinations, in order that all dead fish may be removed, and the culch kept clear of mud.

In places where the layings are never laid bare by the tide, this is done by means of a dredge, all live fish and culch being carefully thrown back, while dead fish, soft mud, and mussels are removed. There can be little doubt that some such system might be adopted in rearing pearl oysters, and Dr. Kelaart reported that "he sees no reason why pearl oysters should not live and breed in artificial beds, like the edible oysters, and yield a large revenue?" He has ascertained, by his experiments in Ceylon, that the pearl oysters are more tenacious of life than any other bivalve with which he is acquainted, and that they can live in brackish water, and in places so shallow that they must be exposed for two or three hours daily to the sun and other atmospheric influences. Captain Phipps, the superintendent of the Tinnevely pearl banks, came to the same conclusions; and, convinced that artificial nurseries for the young oysters are the only means by which remunerative fisheries can be ensured, he proposed the following plan, which has been adopted.

The harbour of Tuticorin is formed by two long islands, and between them and the mainland there is a bank about three miles long by a quarter of a mile broad, with a depth of from three to seven feet, entirely free both from surf, currents, and influxes of fresh water. Captain Phipps proposes that this bank should be walled round with loose coral until it is formed into a basin, the edges rising three feet above high watermark. Over the bed of the shallow basin thus enclosed, live coral will be regularly spread, so as in a few years to form a solid mass, serving the purpose of culch, and the basin will be divided into three parts, one for the old oysters, and the other two for the young ones that may be in process of rearing. After the division of the basin set apart for breeding has been stocked, it will be carefully watched, and when the spawning has taken place and the young oysters are well formed, they will be removed from the old oysters and rocks to which they are attached, and placed in one of the separate parts of the basin, and the same plan will be followed each succeeding year. On reaching a sufficient age, they will again be removed to one of the pearl banks in the open sea. The last operation is necessary, because it would be impossible to enclose an artificial space which would hold as many grown oysters as are required for a remunerative fishery, and because it is believed that the quality of the pearl depends on the depth and clearness of the sea in which it has been formed. A single oyster, five or six years old, often contains no less than 12,000,000 eggs, and in the fishery of 1861 the total number taken only amounted to 15,874,500, so that the number of young ones annually obtained from the nur-

sery will be abundantly sufficient to stock banks for each year's fishery. Care will of course be taken that only such banks are selected for stocking as have the rocks which compose them raised well clear of the surrounding sand. By this system, adapted as it is from those of the English and French edible oyster fisheries, several advantages will be secured, and all the dangers to which the pearl oysters are now exposed will be avoided. The young growing molluscs, safe on their carefully watched laying at Tuticorin, will be secured from the choking sands of their natural banks, as well as from their alleged enemy, the soorum, the effects of which are probably the same as those caused by the mussels on the edible oyster layings in the Colne. It is during the period of their growth that the pearl oysters are so exposed to these dangers, and very frequently banks have been found well stocked with young oysters, and giving promise of a lucrative fishery, at a preliminary examination, which, when the time for the fishery arrives, are bare, all their inhabitants having died and been washed away. But if preserved during the period of growth in the artificial nursery, and only placed out when they have reached maturity, the oysters can then form their pearl in security until the season for the fishery arrives, and well stocked pearl banks may be reckoned upon for each year. Thus it is hoped that, by adopting these carefully considered plans, and improving upon them as experience and watchful investigation dictate from year to year, a regular and unfailing source of revenue will be secured to the State, and the Tinnevely pearl banks will, after laying dormant for thirty years, regain the immemorial renown which was conceded to them, alike in the days of Ptolemy, of Marco Polo, and of Hamilton. They form the most ancient fishery in the world, and, now that science and careful supervision have been supplied, they will no longer be the least remunerative.

Oysters are amazingly fruitful, one of them is said to contain 1,200,000 eggs; that a single oyster might yield enough to fill 12,000 barrels. The eggs are expelled in the form of spawn, a white fluid resembling a drop of grease, in which the microscope reveals innumerable minute oysters. This substance is called "spats" by the fishermen, and the matter in which they swim doubtless serves to attach them to various submarine bodies, or to individuals of their own species. In this way are formed innumerable banks of oysters, which are kept up by collecting the spawn at sea, and in different places along the coasts of England and France, and depositing it in the sheltered and shallow waters selected for "oyster layings," which are usually kept untouched till

they have arrived at some size, that is in the course of two or three years.

Pearl oysters are found in great number about Capt Comorin, the Island of Ceylon, in different parts of America, in the Islands of the Archipelago, on the Australian coast and the Persian Gulf. The inside of the oysters that produce the pearls bears a certain resemblance to the gems themselves; and hence it would appear that pearls are only the misappropriations of the matter which is secreted by the animal to form the shell. When a pearl is cut through, it appears to consist of several coatings of this matter laid one upon another, as if formed by successive depositions. If, therefore, the substance of which shells are composed, while floating in the body of the mollusc, meets with a particle of this kind, which has accidentally been removed from the proper passages, and become stationary, it may be imagined that it will adhere to this particle, form a layer about it, and, continuing the operation, one of those white pellucid balls we call pearls will be the result.

Of the finest pearls, one of the weight of one carat, or four grains, is worth eight shillings; but should a pearl weigh four carats, its value is estimated at £6, 4s. Some of these gems are, however, of extraordinary worth. A pearl brought, in 1574, to Philip II, though no bigger than a pigeon's egg, was valued at £14,000. Julius Cæsar presented Servilia, the mother of Brutus, with one that cost £48,457; the pearl earrings of Cleopatra were estimated at £161,458; Claudius possessed one of nearly equal worth; and a celebrated character in the reign of Tiberius wore two pearls of such immense value that the historian describes her as carrying in her ears the worth of a large estate.

At the pearl fishery of Tuticorin in favourable years, the pearl mussels sell at Rs. 25 to 100 per 1,000, and the revenue rises up to 1½ lac of rupees in the season.

Pearl oysters abound in eleven or twelve fathoms of water all along the coast of Sind. There was a fishing in the harbour of Kurrachee, which had been of some importance in the days of the native rulers, but was gradually declining. In the salt-water inlets along the entire sea coast of Sind, a thin shelled variety of the oyster exists, producing seed pearl. It is most frequently found on mud banks left dry at low tides. The pearl is of little value when compared with that produced by the Ceylon and Persian Gulf fisheries, the price of the latter ranging from Rs. 1,000 to Rs. 1,500, whilst the former seldom realizes more than Rs. 25, a tola. From the supposition that it possesses invigorating powers, it is used here chiefly as a medicine. The larger grains are occasionally made use of as personal ornaments; the smaller

ones to intermix with the valuable Bahrein pearls, in which manner they are kept in bags by the Bombay merchants, as a means of preserving their lustre. After the latter end of the year 1836, the ameeers of Sind first became aware of the existence of this description of pearl oyster on their coast, by a money tender having been made for the exclusive privilege of fishing them. The banks, called Kenjur, at the entrance to Gharra Creek, were consequently let out for one year for Kashance Rs. 650. The farmer must have profited well, as in the year following they were let for Rs. 1,300 annually for a consecutive period of two years. Subsequently to operations being commenced, a higher offer was received by the ameeers who, with that want of faith which characterized them when a prospect of gain presented itself, gave orders for the immediate ejectment of the original holder of the farm. Similar circumstances operating against the second occupant, he also was ejected; and this process continued, until the sum tendered amounted to Rs. 19,000 per annum. The party to whom the farm devolved at this large rent soon discovered that he had entirely over-estimated its value; and by ceaseless importunity got released from his contract. The ameeers then ordered the fishery to be conducted on their own account, until, finding it unprofitable, it was discontinued. At the close of the year 1839, the Kurrachee Harbour (in the creeks adjoining which the pearl oyster is found) was again let for two years, for Rs. 1,100: six months afterwards other speculators offered Rs. 21,000; it was finally let for Rs. 35,000, the contractors relieving the former occupants, and taking possession of the pearls that had been collected by them. These parties, however, failed, but were made to pay Rs. 20,000. The ameeers, as at Kenjur, took the management of the fishery, which in three months it is said, realized between seven and eight thousand rupees,—a doubtful circumstance, as after a short trial it was altogether relinquished by them. When the country became a British possession, the Kenjur fishery was let by the Collector of Land Revenue for Kashance Rs. 2,500 for one year, commencing from 1st August 1843, but the contract was not fulfilled. The following year, the highest offer made was Rs. 2,400, but the fishermen objected to work, alleging that as their gains were regulated by the amount of produce which was insignificant, they could not earn enough for their support. The contractors appealed to the Government of Sind, who, deciding against them, their contracts ceased. The Harbour Fishery was let out at the same time for Rs. 3,700 per annum, but owing to a misunderstanding of the terms of the contract, it was resumed, and fished by the Collector on account of Government. In

one month, the sum of Rs. 2,272 was realized, exclusive of expenses. The fishermen, however, declined to continue the fishery, on the score that they could find no more oysters. It was thought at the time that they had been bribed by the former contractors to make this statement, but, since then, experience proved that it was not altogether incorrect. In the month of May 1845, the Collector, who was placed in charge of this source of revenue, personally examined the situation of the banks, and found the entire line of coast from Kutch to Kurrachee giving evidence of the existence of the oyster. It appearing that several spots might be fished with advantage, boats and forty divers were engaged, but after a month's labour, at what appeared to be the most productive banks, the expenses incurred exceeded the value of the pearls produced. In 1849, the fishing was sold by public auction for upwards of six thousand rupees, and in the following year for Rs. 5,275. Apprehensive that the continuous fishing would exhaust the beds, an interval of four years was allowed to elapse, after which period it was again put up to public competition, realizing upwards of Rs. 5,000; and the following year (1856) somewhere about Rs. 6,000. From that time until 1862 the banks were not allowed to be fished in order that the young oysters might have time to come to maturity. In 1862 the fishing was again sold by auction, realizing Rs. 5,000. The purchaser was Mr. Coates of Perozepoor—an enterprising and energetic European—who set to work earnestly, making use of dredges which had never been in operation before. It is evident that the fishing must have proved remunerative, Mr. Coates having subsequently offered Rs. 10,000 to have it continued to him for a further period of four years. Government accepted the offer. Mr. Coates is said to have derived but very little profit from the second lease; but this circumstance is ascribed by general consent to his having had some dishonest servants about him. From what we learn, the authorities in the province seem to have taken no action in farming the pearl fisheries after the expiration of Mr. Coates' lease; and it has been stated that it is a common practice amongst most of the fishermen to help themselves to the oysters and dispose of the pearls in the town.

Sir A. Burnes represents the mariner of Cutch in the present day as truly adventurous, putting to sea for a trifling reward, and stretching boldly across the ocean of Arabia, to the Red Sea, and the coasts of Zanzibar in Africa. The sea-vessels of Kurachee sail to Muscat, Bombay and the Malabar coast, and the fishing-boats at the mouths of the Indus he describes as good sea-boats, sailing very quickly, and numerous, because the fisheries there are extensive,

and form a source of commerce on the south-eastern part of the Peninsula of India.

Dr. Cantor states that at the mouths of the Ganges, the fishermen have sea-going boats, which they build themselves, and that they are a superior description of Indian sailors, of much more industrious habits than the majority of the natives of India. Still further to the eastward, we see the Burmese and Siamese almost living in boats, and the Malays most formidable as pirates in the Indian sea.

Farsan, is an island off the coast of Yemen, about three miles from the sea port of Jezan. The sea-faring population there, are largely occupied in the pearl fishery. When not at feud with any of their neighbours the time of the inhabitants of the pirate coast of Arabia, is devoted to fishing, diving for pearls. The pearl fishery only lasts from June to September, for at other periods they complain that the cold is too severe. During the season every person who can procure a boat himself, or obtain a share in one, is thus employed, and their villages have no other occupants than children, females, and men who are too aged to follow this pursuit. The pearl bank extends from Sharja to Biddulph's group. The bottom is of shelly sand and broken coral, and the depths vary from five to fifteen fathoms. The right of fishing on the bank is common, but altercations between rival tribes are not unfrequent. Their boats are of various sizes, and of varied construction, averaging from ten to fifty tons. During one season it is computed that the island of Bahrein furnishes, of all sizes, three thousand five hundred; the Persian coast, one hundred; and the space between Bahrein and the entrance of the Gulf, including the Pirate coast, seven hundred. The value of the pearls obtained at these several ports is estimated at forty lacs of dollars, or eight hundred thousand pounds. Their boats carry a crew varying from eight to forty men, and the number of mariners thus employed at the height of the season is rather above thirty thousand. None receive any definite wages, but each has a share of the profits upon the whole. Where polypi abound they envelope themselves in a white garment; but in general, with the exception of a cloth around their waist, they are perfectly naked. The latter having provided themselves with a small basket, jump overboard, and place their feet on a stone, to which a line is attached. Upon a given signal this is let go, and they sink with it to the bottom. When the oysters are thickly clustered, eight or ten may be procured at each descent; the line is then jerked, and the person stationed in the boat hauls the diver up with as much rapidity as possible. The period during which they can remain under water has been much overrated; one

minute is the average, but on one occasion, exceeded a minute and a half. Accidents do not very frequently occur from sharks, but the sawfish is much dreaded. Instances were related where the divers had been completely cut in two by these monsters. One man of some hundreds present, for a reward of a few dollars, remained one minute and fifty seconds. In Ceylon they rarely exceed fifty seconds. They estimate the unopened oysters at two dollars a hundred, from Bahrein the pearl coast and fishery begins and extends round the east of the island and the promontory of Katar down the great southern bar of the Persian Gulf to the frontiers of Sharjah in Oman. Pearl oysters are also to be found north of Bahrein, along the shores of Kateef and the adjacent islands, but the produce of the fishery is scanty, far inferior to that of the coast of Bahrein and of the easterly gulf. Around Bahrein itself, the fishery yields largely and furnishes occupation to at least half the inhabitants of the island, about 2,000 or 2,500 being employed in the diving season April to October. Negroes mostly are employed as divers.

In the Persian Gulf, the pearl oyster beds extend at intervals almost along the entire length of the Arabian coast of the Gulf from a little below the port of Koweit to the northward, down to the neighbourhood of Ras-ool-Khaimah, southward. There are also some beds near Karrack and at other points on the Persian coast line, but these latter are of comparatively little account as being far less extensive, less prolific and less lucrative. The beds along the Arabian coast are held to be the property of the Arabs in common; for instance, an Arab of Koweit may dive along the Bahrein or Rass-ool-Khaimah coast and vice versa. But no person other than the coast Arabs is considered to have any right of diving: and it is probable that any intrusion on the part of foreigners would create a general ferment along the coast line. The richest banks are those of the islands of Bahrein. They are found at all depths from a little high water mark down to 3, 7, 12, 17 and 18 fathoms. It is probable that there are beds at a much greater depth; for instance, if, as is supposed, it be the fact that there are beds in the inlets of the Mussendom promontory, these beds must have a depth of 22 or 25 fathoms. It is held as a rule that the lustre of the pearl depends on the depth of the water, the greater the depth, the finer the lustre. There does not seem to be any known law governing the more or less sphericity of the pearl. The best oyster beds are said to be level, and formed of the fine whitish sand, overlying the coral, in clear water. A mixture of mud or earthy substance with the sand is considered to be detrimental to

the pearl; and the beds having this defect are liable to exhaustion. It is to this cause that the Arabs of Bahrein attributed the exhaustion of the pearl beds on the coast of Sind and Ceylon; while the beds of the Persian Gulf, although annually fished from the earliest historic periods, continue prolific as ever—one or two of the most recent past years having given a more than usually abundant return. The notion that the Arabs feed their oyster beds at particular seasons of the year, seems to be erroneous. No care whatever is taken of the beds. The oysters swell about over the sand or slightly attach themselves by the hinge to bits of seaweed or coral, and are discerned by the divers in groups below the clear water. The diving period is from the warm spring in April to the end of the hot summer months of August and September.

As regards profits, each boat is partnership, the profits being divided into ten shares.

Owner and Captain....	2	And the rest laid out
The Divers.....	3	for provisions.....
The Rope-holders.....	2	3

A few of these boat-men may reap independently the fruits of their own labours, but the great majority are in the hands of agents of pearl merchants, whether hindoo or other, who reside in the towns of the littoral. These agents make advances of money to the divers during the non-diving season, and when the spring comes on, the boats are supplied with so many days' dates, rice and other provisions, and start away for the banks, returning as provisions fail or weather compels.

Hundreds of boats may be seen anchored at a time on the banks. As a rule the diving may be in water of four to seven fathoms in depth. Fifteen fathoms diving is considered to be extremely prejudicial to longevity, and occasionally proves fatal. In any case the crew is told off into divers and rope-holders, the former diving while the latter keep the boat and stand by to haul the diver up. Each diver has his comrade for this purpose. The diver strips, closes his nostrils with pincers, has a rope attached to his girdle and a stone or other weight to his foot. He then drops overboard feet foremost, and on reaching the bottom collects his oysters until he can no longer remain when he pulls at the string, lets go the weight, and is hauled on board by his comrades. The stone weight is attached to a second rope, by which it is afterwards hauled. The oysters are collected into a bag or other receptacle attached to the diver's chest and waist.

Of course numerous disputes occur among so many boats jostling together in a comparatively small area. In former times these disputes were frequently serious and attended with bloodshed; but more recently the several Arab chiefs of the littoral have entered into a

maritime truce, binding them to refer all their disputes at sea to the arbitrament of the British Resident in the Persian Gulf.

The annual outturn of the pearl fisheries is assumed to be £400,000 as follows:—

Outturn of the Bahrein Pearl Divers,
20 lacs of Rupees or... £200,000

Outturn of the Divers from the Arab littoral of the Persian Gulf other than Bahrein, 20 lacs of Rupees or... £200,000

The revenue levied by the chiefs themselves on the pearl fisheries consists in a poll-tax of one dollar per annum on every diver and on every diver's attendant rope-holder. The revenue so derived by the Bahrein chief may be about 50,000 dollars, thus representing 25,000 divers and 25,000 rope-holders, and amounting to 5 per cent. upon the total outturn.

The great bulk of the best pearl is sent to the Bombay market, where, during the 1863-4 share mania, fancy prices were given for good pearls. A large number of pearls is sent towards Baghdad. As a rule the Bombay market prefers the pearl of yellowish hue and perfect sphericity, while the Baghdad market prefers the white pearl. The small seed pearls go principally to Baghdad also.

It might possibly be of use if a few hundreds of oysters from the Persian Gulf beds were to be sent to Ceylon, in view to ascertaining whether any defined locality in which they might be bedded, could be developed and remain exempt from exhaustion.

At the meeting of the Geographical Society, Mr. Gwyn Jeffreys said that in a conchological point of view the Persian Gulf is wholly unexplored.

The Panama and Bahrein pearl fisheries chiefly supply the market. The finest pearls that decorated the Persian kings, or were showered on them when ascending the throne, (according to a very ancient custom,) might have been obtained from the sea which forms the southern boundary of their dominions; and the pearls here found were most highly prized, according to Pliny, (Nat. Lib. ix. c. 35). Theophrastus mentions those pearls which some islands in the Erythrean sea produce; and Mr. Hill in his notes on that Greek Lithologist (p. 93, Lind. 1746), says "the finest in the world are those of the Persian Gulf. There are a great number found about Cape Comorin and the island of Ceylon, but they are greatly inferior to the Persian, and very large ones have been found about Borneo, Sumatra and the neighbouring islands, but not of the fine shape and water of the Persian." This confirms what Salmasius had before declared. "In sinu Persico Majores reperiuntur qua et ceteris omnibus candoris ac magnitudinis doti anteferuntur. Indc. Romanis."

adferabantur." Plin. Exercit. p. 824, (ed. 1689). The pearls of this gulf are celebrated by various eastern writers among them Hamdallah Cazvini. In describing the sea of Oman, or of Fars, he says, and from the island of Hormuz to the island of Bahrein, it is possible to procure pearls by means of divers; but those which they find in diving about Bahrein, are of such magnitude as cannot be equalled elsewhere; and the chief pearl fishery is from Keis to Kharek; near Aden also, very good pearls may be obtained.

In addition, to its admitted character of an attribute of power, the hindooes looked upon the pearl as symbolical of maiden purity, and hence arose the custom of presenting a pearl at the marriage of a high-born hindoo girl, where, amid the performance of various ceremonies peculiar to the occasion, it is formally given to some honoured guest either by the father of the bride or the bridegroom.

In China, pearls were presented as tribute, and given in dowry two thousand years before the Christian era. In the *url-ja*, the most ancient Chinese book of words, a work composed 1000 B.C., pearls are spoken of as precious objects, which were used as charms or amulets to guard the wearer against fire. In those remote ages it seems probable that the Chinese derived their pearls from the fresh-water mussel only; for it is stated, in the ancient record already referred to, that pearls were brought from the interior of the western part of the empire. About the commencement of the Christian era, native supplies had, however, already fallen short of the increasing demand for this precious commodity, and ships were sent forth to obtain the much-coveted beads from India. As it was then, so the pearl still continues to be regarded by the Chinese as an attribute of power, serving even now as the accredited badge of rank, to distinguish mandarins from smaller men. The Hebrews must, like their eastern contemporaries, have been very early acquainted with pearls, as they are mentioned in the Book of Job. According moreover, to some commentators, the Hebrew word *Penimin*, which is constantly translated "rubies" in the Proverbs of Solomon, should be rendered "pearls." The Romans employed three names to designate the pearl, viz., *Unio*, "the one" par excellence, a term that Pliny tells us first came into use in the time of the wars of Jugurtha, when the fashion of the single ear pendant was in the ascendant, *bacca*, "the berry," in allusion to the ordinary form of the bead; and *margarita*, which, although borrowed directly from the Greek, seems to be derived from the Sanscrit word *mangara*, signifying "decorative." The name *Unio* has been incorporated into science by its application to an extensive genus of pearl-yielding fresh-water

mussels. According to some authorities, our name of pearl, which appears under very slight modifications in almost every European language, is derived from *pirula*, a little pear, or from *pilula*, a pill, while others give it a Teutonic origin, deriving it from the old German word *berlin*, a little berry. The term *margarita*, which has lingered in all the southern European dialects derived from the Latin, has not found its way into the Teutonic or Slavonic tongues. Pliny, in his *Natural History* not only describes the manner in which the bead was supposed to be produced within the shell, but expatiates with indignant warmth upon the dangers and difficulties that attend its capture, and the extravagance, folly, and wickedness, to which a desire for its possession has led men and women in all ages. We learn from him that, after the conquest of Alexandria, pearls came into common and almost universal use in Rome. Before that period they must, however, have been highly prized, as we are told by Suetonius, that Julius Cæsar, before he set out on his expedition to Gaul, expended six million sesterces (nearly 50,000*l.*) in the purchase of one fair pearl as a parting gift to Servilia, the mother of his traitor friend, Marcus Brutus. Cæsar's admiration of pearl is, however, worthy of more than a passing notice, if, as some historians assert, one of his principal inducements to visit Britain arose from a desire to ascertain the truth of the reports, which had reached him in Gaul, that pearls abounded in the neighbouring island of Britain. If such were, indeed, the motive that influenced Cæsar, Britain owes no trifling debt of gratitude to the pearl for having been the means of bringing its savage inhabitants thus early within the sphere of Roman civilization; but, whatever was the incentive that drew the Romans to those shores, it is certain that they at once directed their attention to the discovery of the capabilities of their new conquest; nor were they long in ascertaining that some of the British rivers yielded pearl-bearing mussels. Pliny informs us, however, that the pearls found in Britannia were small and of a bad colour, the reason, perhaps, why Cæsar, instead of presenting them to one or other of the fair Roman matrons whom he delighted to honour, merely devoted them to the decoration of a breast-plate or cuirass, which he caused to be suspended in the temple of Venus Genetrix.

Certain it is, in the time of Alexander I, pearls formed part of the exports from Scotland; and a vestige of this trade has even lingered on to a comparatively recent period; for we are assured that pearls, to the amount of 10,000*l.*, were sent to London from the Tay and Isla between the year 1761, and the beginning of the 19th century. The rivers in the north of Ire-

land, the Tay in Scotland, and the Conway in Wales, have all, from time to time, yielded tolerably good pearls, although the produce has always been so uncertain as to make it not worth the cost of the labour.

Among the ornaments in vogue among the fair dames of Rome, the most characteristic, perhaps, were the pearl ear-pendants, known as *elenchi* and *crotalia*. The *elenchus*, in its original form, consisted of one long pear-shaped pearl, full and rounded at the bottom; after a time, however, when pearls became less uncommon in Rome, the solitary pendant was discarded by ladies of rank in favour of the compound *crotalia*, and the single drop came to be in some degree regarded as one of the attributes of an acknowledged courtesan. The compound *elenchi* consisted of two or three pear-shaped pearls, linked together in such a manner as to strike against each other at every movement of the wearer's head; whence they were called *crotalia*, from *crotalium*, a brass musical instrument resembling castanets. These tinkling ornaments were sometimes suspended from the fingers and sandals, as well as from the ears, and must, one would think, when thus worn, have produced a noisy clatter, the very reverse of agreeable. It is evident, however, that the Roman ladies considered the rattling noise which they made whenever they moved as something peculiarly distingue. "A fair pearl at a woman's ear", says Pliny, according to Holland's antiquated version, "is as good as an huisher to make way for her, for every one will give such the place. Nay, our gentlewomen are come now to weare pearl upon their feet, and not on their shoo-latch only, but also upon their startops and for buskins which they garnish all over with them. For it will not serve their turne to carrie pearles about them, but they must tread upon pearles, goe among pearles, and walke as it were on a pavement of pearles." The necklace most approved of by the ladies of Rome was that consisting of three rows, and known as the *trilinum*. This ornament consisted of one row of pearls fitting somewhat closely round the throat, a second longer string or chain composed of green or blue stones alternating with large pearls, and another similarly formed row long enough to fall far down over the bosom. Where the necklace consisted only of two instead of three rows, it was called a *dilinum*, whilst a necklace of one string of beads was known as a *monile*. When we picture to ourselves a Roman belle adorned with a costly *trilinum*, lustrous *crotalia* hanging from her ears, hands, and feet, with her hair enclosed in a pearl net, or braided with strings of the same precious beads, and chains of pearls linked to the rings on her fingers, we shall no longer wonder that "a mere bit of a

woman" should have carried about on her own little person the accumulated treasures of her house.

Jean Baptiste Tavernier, Baron d'Aubonne, the son of Dutch parents, settled at Paris, was born there in 1605, and was a traveller from his boyhood, having visited most of the countries of Europe between the ages of fifteen and twenty-five. The last thirty years of his life were spent in making repeated voyages to and from Asia, and in visiting all the great cities of Asia Minor, Persia, India, and Thibet; of which he has given detailed accounts, more especially in reference to the courts of the various sovereigns which he visited in the prosecution of his business. According to his own statement, he made six journeys from Paris to Ispahan, and more than twice as many from Ispahan to Agra, and other parts of the dominions of the Great Mogul. He twice visited the diamond mines of Golconda, and never seems to have spared time or money when he wanted to effect a purchase or a sale of jewels. He found that, in regard to magnificence, the Oriental courts far exceeded those of the western world at that time, although he seems to have formed no very exalted opinion of the taste which regulated its display; and, among other peculiarities, he was much struck with the fact that the orientals gave the preference to pearls having a yellow tinge, for which they were always ready to give the highest prices, considering that the whiteness of a pure pearl was not sufficiently becoming to their own yellow skins. Tavernier gives his readers a full and detailed account of the famous "peacock throne" of the Grand Mogul Aurengzeb, the barbaric glory of which has long since departed, never to revive.

The most perfect pearl in respect to form, colour and size, seen by Tavernier during his sojourn in the East, was one that had been bought at the fishery of Catifa, in Arabia, by the king of Persia, for about 20,000*l.* of our money. This pearl was entirely free from any defect. The largest pearl then known was in the possession of the Great Mogul, who was so chary of it that he seldom wore it. Another marvellous pearl, seen by Tavernier, belonged to Imenheet, the prince of Muscat, who waged a successful war against the Portuguese, and contributed largely to the decline of their supremacy in the Indian seas. The pearl owned by this prince was perfectly round, of such excessive clearness as to be almost transparent. It is to be doubted, however, whether any pearl celebrated in ancient or modern times can be compared, in point of size, with a colossal beauty belonging to Mr. Hope, which is said to weigh 450 carats (or about three ounces), measuring two inches in length, and

four-and-a-half inches in circumference. Truly this is a *pellegrina*, or paragon, the sight of which would have pleased Tavernier more than all the wonders of art and nature that he witnessed during his six voyages from Paris to Ispahan, and his twice six journeyings from Ispahan to the extreme boundary of the Eastern world. Yet, superlative as is the Hope pearl for size, the palm of excellence in respect to beauty of form and intensity of lustre is due, according to Fischer von Waldheim, a great authority on these points, to a small pearl, weighing only thirty carats. This paragon which formed part of the priceless treasures of the Zosima Museum at Moscow, when Fischer saw it in 1818, was perfectly round in form, and so lustrous that, when it was rolled along a piece of fine cambric, it looked like a ball of silver. The owners of this treasure, who had then no expectation of meeting with a purchaser capable of paying the price at which it was valued, kept it enclosed in a gold-mounted echinus shell, through whose convex crystal cover the Zosima pearl shone forth with almost diamond-like lustre.

Cleopatra's pearl.—The world-renowned tale of Cleopatra's pearl bears testimony to the luxury and prodigality that characterised the last of the Ptolemies. The story runs that, at a feast in the palace at Alexandria, Antony staked a heavy wager that his fair hostess would find it impossible to expend ten million sesterces—about £80,000, of our money—on one entertainment. The fair queen accepted the challenge, and at once proved her reckless prodigality and her determination to eclipse the lavish expenditure of her victor by removing from her ear one of the two incomparable pearls that had descended to her from her ancestors, and, dropping the pendant into a cup of vinegar, swallowing the costly draught. Not content with this marvellous display of extravagance, she was about to take the fellow of this lustrous bead from her other ear and immolate it in like manner, when Lucius Plaucus, who had been appointed umpire in this lover's contest, snatching it from her hand, prevented the double sacrifice by proclaiming aloud that the victory was again with the lovely queen of Egypt, and that Antony had been fairly vanquished. The rescued pearl was afterwards divided, and the severed halves employed to adorn the ears of the Venus of the Pantheon. We learn from Pliny that the palm of extravagance in this respect is not due to Cleopatra, as before her time a similar feat had been performed by Clodius, the son of the tragic actor *Æsop*. According to old Philemon Holland's version of the *Historia Naturalis*, "Clodius upon no wager at all, but only in a braverie, and to know what taste pearls had, mortified them in

vinegar, and drunke them up, and, finding them to content his pallat wondrous well, he gave to everie guest at his table one pearle a-piece to drink in like manner." Dr. Mobius, in his *History of pearls*, denies the practicability of this much-renowned feat of gastronomy. The most, that the queen of Egypt could have done, he says, was to have swallowed a pill worth some £80,000, as no amount of vinegar could have dissolved the pearl within any period of time to which the most elaborate and prolonged supper could possibly be extended; for, even if the delicate outer layers had been dissolved, the organic portions of the pearl would still have remained undestroyed. Determined to prove the false pretences on which Cleopatra has claimed the wonder of succeeding generations for her unparalleled extravagance the German doctor, as if it were his mission to destroy a very harmless historical myth, instituted a series of experiments on the solution in various acids of small seed pearls. It is needless to say that these investigations were prosecuted with that pertinacity that only German experimentalists can employ and the result thoroughly satisfied him that Cleopatra's supposed feat was an impossibility. We are not sure, however, that Dr. Mobius will earn any great amount of gratitude for his pains.—*King; Williams' Middle Kingdom*, p. 272; *Hon'ble Mr. Morrison's Compendious Description; Journal of the Indian Archipelago*, Vol. iv, p. 490; *Ramusio*, Vol. i.; *Craufurd's Dictionary*, p. 330; *Eng. Cyc.*: *T. Finmanuel; On the natural and artificial production of pearls in China*, by F. Hague, H. H. M. Consul at Ningpo, 17th December 1853; *Low's Sarawak*, p. 89; *Keppel's Ind. Arch.*, Vol. i, p. 59; *Walton's State*, p. 38; *History of Japan*, Vol. 16, pp. 110–11; *American Expedition*; *Tomlinson; Journal of the Royal Asiatic Society of Great Britain and Ireland*, Vol. xvi, Part 11, p. 280; *Recollections of Ceylon, its Forests and its Pearl Fisheries*, S. PEARLASH.

Kien-sha, CHIN.

The term is applied to calcined potash. It has a spongy texture, and a whitish pearly lustre. Pearlash can be prepared from nitre and charcoal.

PEARL-BARLEY.

Fimi, Chin.

Husked barley.

PEARL, FALSE, are made of fish bones. False pearls are sent from China to India for ornaments, as well as employed by the Chinese.

PEARL FISHERY, see Jezan, Pearls.

PEARL, MOTHER OF.

Sudd, Hind. | Gohur parvur, Pers.
Indong mootiara, Malay. | Seepie moothoo, Tam.

Mother-of-pearl used to be sold by the Lubbi Stone Merchants, cut into beads and other ornaments which first they called Surat Munnie, owing to their being brought from Surat. The beautiful lining of shells, known as mother-of-pearl, is manufactured into articles of great beauty. The sea ear or Oreille de Mer, is a shell-fish abundantly found in Jersey island, and used in a variety of ways for food, while the shell is preserved, and exported to England, where its pearly iridescence causes it to be valued in ornamental papier mache works, vases and table-tops.

PEARL OYSTER, is a term applied to the *Meleagrina margaritifera*, which is not however an oyster proper but a genus of the Aviculidæ or wing-shell family of molluscs. The pearl-oysters are less oblique than the other aviculæ and their valves are flatter and nearly equal. They are found in about 12 fathoms water at Madagascar, Ceylon, the Persian Gulf, Swan river, Panama. There are three principal kinds worth from £2 to £4 per cent. 1, the silver-lipped, from the Society Islands, of which about 23 tons are annually imported into Liverpool. 2, the blade-lipped, from Manilla, of which 30 tons were imported in 1851. 3, a smaller sort from Panama, 200 tons are annually imported. In 1851, a single vessel brought 340 tons. These molluscs afford the oriental pearl and their shells the mother-of-pearl of commerce. Mr. Hopo's pearl said to be the largest known, measures 2 inches long, 4 round, and weighs 1,800 grains. Sections of pearls show very fine concentric laminæ surrounding a grain of sand or other extraneous matter. The nacreous lustre has been attributed to the diffraction of light from the outcropping edges of the laminæ, but Dr. Carpenter says it may result from the minute plication of a single lamina.—*Woodward*.

PEARL RIVER or Chu-kiang, a river near Macao. The pearl river affords two or three kinds of fresh-water shell-fish, of the genus *Mytilus*, which are obtained by dredging. See Chu-kiang.

PEARL SAGO, granulated sago meal. See

PEAT, is composed chiefly of the decayed fibres of mosses, and is used as fuel. Dr. Falconer obtained very modern peat, out of the banks of the Hooghly, a few feet below the

surface of the soil, in which were seeds of the *Euryale ferox*: this plant is not now known to be found nearer than Dacca (sixty miles North East, see p. 255), and indicates a very different state of the surface at Calcutta at the date of its deposition than that which exists now, and also shows that the estuary was then much fresher. This peat Dr. Falconer also found to contain bones of birds and fish, seeds of *Cucumis maderaspatana* and another Cucurbitaceous plant, leaves of *Saccharum sara* and *Ficus cordifolia*. Specks of some glistening substance were scattered through the mass, apparently incipient carbonisation of the peat. Peat was discovered on the Neilgherries. It is generally distributed over the entire range of the hill tract, and is so abundant that it is sold at the bog-side at 1s. per cartload of 1,000 lbs., and at about 2s. 6d. a ton, at the principal settlement, Ootacamund. It exists in large quantity and may be purchased at a reasonable rate; and if a proportion of this was used in houses with the wood, the expenditure of the latter would be much lessened, and the total cost to the consumer considerably reduced. Turf fuel is cut stacked in several places close to the station, and is to be had at the rate of Rs. 2 or 2½ per cartload. It burns well and makes a cheerful fire, especially when mixed with wood. Peat, or turf fuel; is now used on the Neilgherry hills more than formerly. The plants producing it, are different from those of Europe. Good peat has been found in the Mid Himalayas at the Sach pass, resembling Irish turf in its character, and in the genera of producing plants.—*Faulkner; Hooker's Him. Jour, Vol. ii, p. 341; The Universal Review, p. 564; Cleghorn's Forests and Gardens of South India, p. 162; Cleghorn, Punjab Report, p. 19.*

PEAUX, FR. Hides; skins.

PEAUX D'AGNEAUX, FR. Lamb skins.

PEBBLES, the quartzose minerals of Cambay, are sold in Europe and America, as Scotch, Irish, Chamounix, Niagara, and Isle of Wight. Pebbles according to the locality whence brought.

PECH, HIND. A wire screw used in surgery.

PECH, GER., IT. Pitch.

PECH, a river near Sindwara in Nagpore.

PECHA, HIND. A scarf worn by Lahouli women.

PECHAK, HIND. A reel for gold thread.

PE-CHE-LE, a province of China the principal length of which extends from 38° to 40½° north latitude, is bounded by Chinese Tartary on the north, by Ho-nan on the south-west, by the Imperial sea and Shantung on the east, and by Shan-se on the west. Peking, the capital of the empire, is situate in this province, together with nine other cities of

the first class, forty of the second class; and one hundred and eighty of the third class. In the Gulf of Poche-le, the tide, being retarded by islands, rises only about ten feet, but the greater part of the land being only about three feet above high-water mark, and there being but few mountains, the rivers are navigable for a considerable distance, notwithstanding their comparatively small size, and in the rainy season they frequently overflow the country. The river Pei-ho experiences a tidal rise one hundred miles inland from the bay; it flows through a completely level country, the soil of which is composed of light sand and micaceous particles, blended together with portions of clay and vegetable mould, without a single rock, stone, pebble, or gravel of any kind. *Sirr's China and the Chinese*, Vol. i, p. 410.

PECHWAN, HIND. A hooka with a long twisted, peel, pipe.

PECTEN, a genus of molluscs.

PECTINES, LAT. Combs.

PECU, IT. Cattle.

PECHIKA, TEL. *Ambrosinia unilocularis*, R. iii. 493.

PEDA also Gomayam, TEL. Cow-dung and Bratties, or cow-dung cakes.

PEDA-DOSKE, TEL. *Cucumis momordica*.

PEDA DULCHIRRAM, TEL. of Godavery, Dirasana of Circars. *Acacia speciosa*, a valuable timber tree.

PEDA-KAL-MESURA, TEL. *Casearia*, species.

PEDALI, or Pedayi, or Bedali. *Griffithia fragrans*, W. and A.

PEDALIACEÆ, Lindl. The oil seed tribe of plants, comprising 2 gen. 3 spec., viz. 1 *Pedalius*; 2 *Sesamum*.

PEDALIUM MUREX, Linn., Roxb., Rh.

Kaka mooloo,	MALEAL.		

A succulent pretty large plant, with small yellow flowers which appear in the rains, the green leaves when agitated in water render it mucilaginous: this is prescribed by the natives in dysuria, the seeds are supposed to possess similar virtues. This succulent, ramous, annual, grows generally over the country, but chiefly on the Coromandel coast, in a moist sandy soil; flowers in the rainy and cold seasons. The fresh leaf of this plant, when agitated in water, renders it mucilaginous, in which state it is prescribed by the natives, in cases of dysuria and ischuria. The seeds which are contained in the prickly capsule are supposed to have similar virtues and are administered in decoction.

The fresh plant renders water or milk very mucilaginous without altering the taste, colour or smell of the liquid. This thickening disappears in a few hours. A watery infusion of this kind sweetened with sugar is a favourite and excellent demulcent in acute gonorrhœa. Butter milk is often fraudulently thickened by the use of the leaf; the plant is a good mucilaginous demulcent, much used by the natives as a drink in gonorrhœa, and is useful as a diuretic, in urinary diseases. It is considered cool and tonic.—*Riddell; Hort. Mal.; Ains. Mat. Med.*, p. 69; *Roxb. Fl. Ind.*, Vol. iii, p. 114; *O'Shaughnessy*, p. 480; *Beng. Pharm.*, p. 304; *Powell's Hand-book*, Vol. i, p. 364.

PEDILANTHUS TITHYMALOIDES, the Jew bush, of the West Indies, introduced into the Calcutta Garden, and now common everywhere about Calcutta in hedges. A shrub about 6 feet high, abounding in white bitter milk, known and used in America as ipecachuana:

in numerous trials no proof was obtained of its efficacy; this is probably the result of deterioration of properties through the influence of the climate of Bengal, as this American plant, is used in the West Indies as a substitute for the ipecacuanha. It is seen in cultivation occasionally, and in the neighbourhood of Calcutta it is abundant as a wild plant.—*O'Shaughnessy*, p. 566; *Mason*. See Euphorbiaceæ.

PEDIR POINT or Batoo pedir, in lat. 5° 31' 00" N., long. 95° 52' 30" E. bears distant 15 miles from Batoo Pootie S. 65° E. and is a table-land of moderate elevation.—*Hors*.

PADMA or Kamala, see Lakshmi, Vedas.

PEDMALAYA, see Lakshmi.

PEDONG, BURM. Pterocarpus marsupium.

PEDRA BRANCA or White Rock, in lat. 1° 20' 20" N., long. 104° 25½' E. lies in the middle of the entrance of the Straits of Singapore, 7½ miles west from the east peak of Pulo Aur, on which is erected the Horsburgh lighthouse.—*Hors*. See Singapore.

PEDRA BRANCA, or Tysing-Chan, a rock with a summit on the south coast of China, in lat. 22° 18½' N. and long. 15° 7¼' E., 49 miles eastward of Lema Island.—*Hors*.

PEDRAHUME, PORT. Alum.

PEDRO DA COVILHAM and Alfonso de Payva, were sent as merchants in 1494, via Genoa, Alexandria, Cairo and the Red Sea, to Aden, where they separated to meet again at Cairo, in Abyssinia, Payva to search for Prester John, whom he heard of as reigning there over a highly cultivated people, but he died before reaching Abyssinia. Covilham went on to India where he made drawings of cities and harbours, especially Goa and Calicut. Thence he returned along the coast of Persia to Cape Gardafui, and continued south to Mozambique and Zofala where he ascertained that that land joined the Cape of Good Hope. From Zofala he returned to Abyssinia and sent his diary, charts and drawings to Genoa by some Portuguese merchants who were trading to Memphis. On receipt of these, king Emmanuel, in 1495, sent four ships under Vasco de Gama, who visited Natal and Mozambique: in 1498, he was at Calcutta, in 1499 back at Lisbon.

PEDRO POINT, see Tanjong bato.

PEDRO-TALLA-GALLA, the highest peak in the mountains of Ceylon, 8,280 feet above the sea.

PEDUM, a genus of molluscs.

PEDUMPA, or Puli dumpa, TEL. Dioscoria deamona, R. iii, 805—W. Ic. 811—D. triphylla, Willd.—*Grah. cat.* 218. Roxb. distinguished between these two sp. which Graham has united.

PEEAZ, HIND., PERS. Onion.

PEECH, PERS. Tallow.

PEE-CAJENNEAM, Wedelia calendulacea.

PEECUM CHEDDY. Luffa acutangula.

PEE-DAUP, BURM. Mimosa, species. A wood of Tavoy.—*Dr. Wallich*.

PEEDOO MARUM, TAM., the Peemah wood.

A small tree wood used for building in Wy-naad where it grows plentifully.—*McIlvor, M.E.*

PEEK DAN, or Oogal dan, HIND., a spittoon.

PEEKUN-KAI, TAM. Cucumis acutangulus.

PEELA-BIHUNGARA, BENG., HIND. Wedelia calendulacea.

PEELA-BIHUNGARA, DUK. Verbena triphylla.

PEELA MOM, HIND. Yellow bees' wax.

PEELAN, the largest of the Islands adjacent to Baseelan, is about 7 miles long.—*Hors*.

PEELA PULLUM, TAM. Artocarpus integrifolia, Linn.

PEELIA DOGHOO-KAIA, TEL. Mucuna prurita, Cowage.

PEELI SAYND, DUK. Euphorbia tortilis.

PEE-MAH, BURM. Lagerstræmia, sp.

PEEMAH WOOD, ANGIO-BURM. See Peedoo marum.

PEE MA PEW, BURM. White Peema, a tree of maximum girth 6 cubits and maximum length 30 feet. Very abundant all over the Tenasserim and Martaban provinces near the red Peema. When seasoned it floats in water. It is a tough wood, lighter than, but does not last for so long a time as, red Peema, and rots in any position when shut out, as in the hulls of ships, in store, &c.—*Captain Dance*.

PEE MARUM, TAM. Sterculia guttata.

PEENARI MARUM, or Peenata Marum, TAM. Sterculia fætida.

PEENGADO and Bambwai, timber of Burmah possess the same property as Anan in resisting decay, but are less abundant, denser in grain, abound in knots and are smaller in size than that timber: they are, however, prized by the Burmese for their useful properties, and are with Thengan generally used in the whole tree as posts for monasteries, houses, &c. "In the construction of wharfs and embankments on the river face, both "Anan" and "Peengado" would be found valuable for posts, and if proper care be observed in the selection of the timber and in freeing it from all the sap portions of the tree, it would doubtless prove as lasting as brick-work.

PEENNAS, HIND., TAM., TEL. Beans.

PEEPOOLI-JHUN-JHUN, BENG. Croton laria sericea.

PEEPUL, HIND. Ficus religiosa, Linn, the poplar-leaved fig tree, the celebrated tree of Buddha Gaya, of which a shoot has been cherished at Anurajapura for twenty centuries. Such trees are maintained in the courtyard of nearly

every wihara or temple in Ceylon as objects of veneration.—*Tennent*, i, 343, ii, 614; *Hardy's Eastern Monachism*, p. 212; *Know*, p. 18; *Yule Cathay*, Vol. ii, p. 367.

PEEPULEE. Copper mines occur at this place.

PEER, HIND., a spiritual guide or saint.

PEERALHI.—? *Epicarpurus orientalis*.

PEERAN-I-PEER, the saint of saints, i. e., Dustageer.

PEE-RAPUTHEE.—? *Bignonia scabrella*.

PEERIA NUDDY, near Gaenic in Bareilly.

PEER-I-DUSTAGHEER SAHIB, a mahomedan walee or saint whose tomb is at Baghdad. He is considered the chief of their saints.—*Herk*.

PEER JULAL.—? oblations are offered at his shrine.

PEER MUGGUN. A place of mahomedan pilgrimage, ten miles west of Kurrachee, famous for its hot springs and crocodile tank, from which it is erroneously supposed to derive its name, the crocodile here being the long-snouted garial, not the short-nosed muggur. About a hundred of these are kept in a marsh close by.—*Dr. Baist's Catalogue*.

PEERO or Piru, SINDI, name of fruits, Mitha Piru, is *Salvadora persica*, Kan-pirun, *Solanum incertum*, Phika-piru, is *Phyllanthus multiflorus*.

PEEROONJOLAY MARAM, TAM. Hymenodyction utile.—*W. Ic*.

PEER POINTEE. Father Pointee, or St. Pointee, a mussulman saint. His tomb, resembling that at Sicligully, though less picturesquely situated, stands on a little cliff above the river, with some fine bamboos hanging over it.—*Heber's Journal*, Vol. i, p. 199

PEER PUTTA, HIND. *Chamærops ritchiana*, *Griffiths*.

PEER PUTTAREE. HIND. an agate.

PEERZADAH, PERS., HIND. Son of a Peer, from Peer, a saint, and Zadah, the offspring. It means a religious devotee, and is considered a most sacred appellation.—*Pottinger's Travels in Beloochistan & Sind*, p. 139.

PEETA, also Haridra, SANS. Turmeric, *Curcuma longa*, *Roxb.*, *Rheede*.

PEETAKARA, HIND. *Chrysophyllum acuminatum*.

PEETALEE SHEERNEE, HIND. Cakes of raw sugar.

PEETAMVARA, SANS., from peeta, yellow, and umbara, cloth.

PEE-TANDALE COTTI, TAM. *Crotalaria verrucosa*.

PEETAPOOR. In Guzerat, occupied by the Bagela race.

PEETHA KALABUNTHA, TEL. *Agave vivipara*.

PEE THA KHA HSEN FREE, BURM. *Cassia sp.*

PEE THA KHA HSEN BAU, BURM. *Cassia, sp.*

PEET-SHAL, BENG. Peet shala, HIND. *Pterocarpus marsupium*.

PEETUL, GUZ., HIND. Brass.

PEETUMMA, TEL. *Vachellia farnesiana*, *W. & A.*

PEEYAR CHEROONJIE, HIND. *Buchanania latifolia*.

PEGANUM HARMALA, *Linn.*

Harmala ruta.

Syrian rue,	ENG. Harhar?	HIND. ?
Hurmara,	DUK. Islam lahori,	
Harmal,	Spelanc,	TR.-INDUS.
Isband,		

This plant occurs in many parts of India, and is found in the Taj garden at Agra. The seeds are used in native medicine, and called Lahoree Hoorumul. In the "Mukhzun-ul-Udwiah," the seed is called Moolie; the same as the *Πύραρον* of Dioscorides. *Peganum harmala*, and *Lactuca virosa*, are both said to possess narcotic properties like opium. Many north African or Arabian forms, such as *Peganum*, *Harmala*, *Fagonia cretica*, *Balanites Aegyptiaca*, *Acacia arabica*, *Alhaji*, *Grangea*, *Calotropis*, *Salvadora persica*, extend through the drier parts of India, and others, *Cleome*, *Balsamodendron*, *Astragalus hamatus*, *Cucumis colocynthis*, *Berthelotia*, *Anticharis arabica*, &c., have a less extensive range, and there is a striking resemblance between the vegetation of tropical Africa and tropical Asia. Used in dyeing black. The seeds of this plant are attracting attention in Europe as a brown and black dye. The plant grows everywhere on waste broken ground in the Punjab, and might be collected at a very cheap rate, except perhaps as regards carriage but the subject wants attention. The *Peganum harmala* is abundant in many parts of the Punjab plains from the Sutlej westward, is more rare to the east. It also occurs in the N. W. Himalaya up to Kashmir (5,000 feet), and in Tibet at 8,300 feet (*Thomson*). Has a strong nauseous smell, was remarked by Elphinstone (en route to Kabul) near Peshawar, and compared to "Devil in the bush," so was supposed by Royle to be *Nigella*. The seeds of this plant were at one time imported into England from the Crimea, &c., as a red dye, and some years ago enquiries were made with a view to sending some for trial from the Punjab. But it was found that they would not have a chance, chiefly owing to the discovery of the cheap coal-tar dyes. It is an indigenous and abundant plant. Principally used as a fumigatory agent to avert evil influences especially when any person is present suffering from wounds, ulcers or abscesses. The plant is considered proper only for sweepers

and not to be touched by Sikhs or Hindoos, but the seeds are burned on a fire if any person enter a room who may have any discharge which could render him unclean.—*Drs. Hooker and Thomson's Flora Indica*, pp. 83, 115; *Powell's Hand-book*, Vol. i, pp. 295, 335, 452; *Royle*, p. 155; *O'Shaughnessy*, p. 260.

PEGASUS, a genus of fishes of the section Syngnathidæ, one of the species is known as the flying horse: the flying fish and flying gurnard, are other flying fish.

Pegasus natans, L.—Three inches long, a small fish with two largish fins near the head.

Pegasus draconis, L.—Three inches long, dark-coloured, with two very large fins near the head.

PEGU lies between the parallels of 15° 44' and 19° 27' north latitude and the meridians of 94° 31' and 96° 52' east long. The area is estimated at 32,250 square miles, and is allotted for revenue purposes into the following divisions:—

Rangoon, Sq. M.	9,800	Henzada, Sq. M.	2,200
Bassein, „	8,900	Tharawaddi, „	1,950
Prome, „	5,500	Tounggoo, „	3,900

The inhabitants consist principally of Burmans and Peguers; the Karen; the Karen-nee or Red Karen; the Khyin whose women tattoo their faces; the Yeh-baing of the Yoma range and the Shan, who form separate communities. Under the Burmah rule, the revenue of Pegu is supposed to have been about Rupees 15,71,498, but the revenue, about the year 1857, amounted to Rupees 30,21,062, two-thirds of which amount is raised from taxes on the land, capitation, fisheries, excise and inland and sea customs. Major Phayre, in July 1856, set down the following as the area and population of the British Province of Pegu.

District.	Area in Sq. Miles.	Pop.
Rangoon.....	9,800	137,130
Bassein.....	8,900	128,189
Prome.....	5,500	70,000
Henzada.....	2,200	103,775
Tounggoo.....	3,950	34,957
Tharawaddi.	1,950	66,129

Total.... 32,300 540,180

Pegu has four great mountain ranges; the range separating Arracan from Pegu is about 4,000 feet high; the range separating the valley of the Irrawaddy from that of the Sitang, about 2,000 feet high; the Martaban and Tenasserim ranges, about 5,000 feet, and the fourth or most eastern separates the Sitang and Salween rivers, and extends into the large and compact mountain group of Younzallen to the south-east of Tonghoo. The area of this lofty region is about 100 square miles, and several peaks rise to 7,000 and 8,000 feet. Pegu was annexed by proclamation on 20th Dec. 1852,

contained, in 1867, 32,300 square miles 900,000 people; Tenasserim and Martaban contains 37,000 square miles and 332,000 people; Arracan contains 10,700 square miles and 362,000 people; Assam contains 20,000 square miles; since 1819, 100,000 square miles of territory have been conquered from Burmah in the province of Assam, Arracan, Tenasserim and Pegu.

Pegu collections.

1853-54.....	Rs. 12,44,763	1856-57.....	Rs. 34,90,478
1854-55.....	„ 23,30,603	1857-58.....	„ 40,81,477
1855-56.....	„ 30,21,062	1858-59.....	„ 45,31,120

The geographical area of the province of Pegu according to the last official returns of 1871, amounts to 32,250 square miles, and the population to 10,41,346.

Until 1863, its several provinces were most anomalously placed with reference to an efficient administration. Arracan was under the authority of the Lieutenant-Governor of Bengal, Pegu was under the direct control of the Governor-General in Council. Tenasserim was partly under the orders of the Governor-General in Council, and partly under the Board of Revenue, and the Sudder Dewanny and Nizamut Adaulut. Though of one cognate race the Burmese were thus subjected to different forms of British administration. There was no intelligible system conducted and no uniformity in any of the provinces. It was therefore, as natural as it was politic, to amalgamate them into one separate and distinct Government. Accordingly, on the 31st of January 1863, three maritime provinces of India beyond the Ganges, which had been conquered from the Burmese Empire, were united under one local administration and called 'British Burmah,' comprising the ancient kingdoms of Pegu and Arracan, with the long line of sea coast known as Tenasserim. The two last of these were acquired by treaty after the war of 1825-26. Pegu was occupied and retained consequent on the war of 1852.

The Province of British Burmah lies along the eastern shore of the Bay of Bengal, extending from the mouth of the Naf Estuary, in about 20° 50' north latitude to the Pak Chan river in about 10° 50'. It possesses a direct line of sea coast, of not less than nine hundred English miles, and a total area of ninety thousand square miles. Each division possesses one principal seaport that is to say; Tenasserim has Moulmein; Pegu, Rangoon; and Arracan, Akyab. The first and last mentioned ports, have risen entirely under British rule, Rangoon was founded by Alombra, the Burmese conqueror of Pegu, and was peopled by the inhabitants of the ancient capital, who were brought away for that purpose. Arracan, the most northern division of the province, is separated to

the eastward from Pegu and Upper Burmah, by a range of mountains, which attains at its greatest elevation, about seven thousand feet. The range runs nearly parallel with the line of sea coast, and gradually lowers toward the south. The northern portion of the country has a large area of alluvial soil, in the lower course of the river Kuladan and its numerous affluents. The breadth of the land there, from the seashore, to the water shed mountains is from eighty to ninety miles. A large portion of the country is hilly, covered with forest and difficult of access. The water shed range, separating Arracan from Pegu extends southerly, and between that range and the seashore, for a length of nearly two hundred miles, as far as a point of land near Cape Negrais, the country is a mere narrow strip of land. For the last hundred and fifty miles, the hills seldom exceed five hundred feet elevation. That portion of Arracan was united with Pegu, when the latter was occupied by the British.

Pegu and Martaban lie in the valleys of the Irrawaddy and the Sitang rivers. These valleys, bounded east and west by mountain ranges, are narrow in the upper portions, but expand at the delta of the Irrawaddy, into a magnificent alluvial region, penetrated by a vast number of tidal creeks, and extending over ten thousand square miles.

Northern Tenasserim is bounded to the west by the last hundred miles of the course of the great river Salween. This river without a delta and with passless rapids one hundred miles from its mouth, which bar the ascent of boats to Central Asia, is joined at Moulmein by two streams which facilitate communication with the interior. The breadth of land from the seashore at the mouth of the Salween to the central mountain range which divides the province to the eastward from Siam is about eighty miles. The space is gradually narrowed to forty miles at the southern extremity in 10° 50' of north latitude. There is no river of importance southward of the mouth of the Salween. The interior of the country is a wilderness of hills, thickly wooded, running in a general north and south direction, with long narrow valleys. Several salt springs are found in the Henzadah district, undoubtedly of some economic value, in the localities where they are found. Nearly mid-distance between the valley of the Irrawaddy on the east, and the coast line of the Bay of Bengal on the west, runs the Yomai or Arracan range of mountains. Spurs of this range are first seen after passing above Henzadah. On the eastern slopes of these hills, and in the valleys lying at their base, some thirteen distinct localities have been traced, where these brine springs are found. With only two or three

exceptions, there are small streams running near the positions of these salt wells. The water of some of these springs, is exceedingly salt and briny. For years past, the people of neighbouring villages have worked them in manufacturing salt. It is obtained by the ordinary mode of evaporation from pans, by a slow process of boiling. The salt is considered good, and is sold at reasonable rates, to the surrounding villages. To these people, the existence of that repository of salt, is most advantageous. A supply of that wholesome and essential condiment is thus procurable not far from their own dwellings. The great bulk of the salt used by the population of the province, and even in the Burmese territory, is, however, manufactured at the villages which fringe the sea coast. The price is very reasonable and is cheap at the places where it is produced. The higher up the river it is taken, the more expensive it becomes, though it never attains to a price, which places its use beyond the reach, of even the poorest among our peasantry. All of the thirteen salt springs which lie generally near the base of the Arracan hills, have been worked by the people of the country. A few are still worked. One of unusual richness, is pronounced to be capable of yielding 920 pounds avoirdupois of salt daily. The wholesale price of salt in the villages where it is manufactured, is between five and six thousand Burmese viss, per hundred rupees. This would make it as low, as three farthings per pound. In the Rangoon market, it is sold at four, to four and a half rupees per hundred viss, or a few fractions over a penny a pound. When conveyed up the Irrawaddy, or inland, it fetches about double and treble this rate.

Dr. McClelland noticing 76 timbers, of the Pegu forests generally, says, eighty-five species of white woods are soft and useless, being only fit for fuel. Many of them however are valuable, either for their fruit, gums, oil-seeds or spices; others, for their close and compact structure, are employed in the manufacture of small ware, as a species of *Nauclea* is used for making combs and two species of *Erythrina* yields the light charcoal employed in the manufacture of gunpowder. These light woods, useless as timber, belong to the families of *Urticaceæ* (including more than twenty species of *Ficus*), and *Sterculiaceæ*, *Laurinæ*, *Rubiaceæ*, *Myristicaceæ*, *Anonaceæ*, *Spondiaceæ* and *Bignoniaceæ*, with odd species from other families.

The remaining white woods, twenty-five in number, are valuable for their strength and closeness of grain. Seventeen of these are fit for house-building, viz.

Hibiscus macrophylla.
Kydia calycina.
Eriolena tiliifolia.

Amoora (Aglaia) rohituca.
Juglans tricocea.
Geloxium bifarium.

Connarus
Grewia floribunda
" *spectabilis*.
" *Hookerii*.
Sapindus rubiginosa.
Millingtonia simplicifolia.
Sandoricum indicum.

Excoecaria agallocha,
Walsura piscidia.
Canarium geniculatum.
Indigofera sp.
Terminalia belerica and *T.*
violata.

And eight of them from the hardness and fineness of their grain, are valuable as fancy woods for cabinet making, viz.

Semecarpus anacardium. *Conocarpus robustus*.
Sibia sp. (glomerata.) *Bauhinia parviflora*.
Casuaria pentandra. " *brachycarpa*.
Chaulmoogra odorata. *Elæodendron integrifolia*.
Strychnos nux-vomica.

The red-colored woods are twenty-five in number, seven from their strength and solidity, are adapted for the various purposes of house-building; viz

Heritiera minor. *Sonneratia apetala*.
" *litoralis*. *Terminalia chebula*.
Eugenia pulchella. *Lagerstræmia pyramah*.
" *myrtifolia*. *Aglaia spectabilis*.
" *vulgaris*. *Ulmus alternifolius*.
" *ternifolia*. " *integrifolius*.
" *jambolana*.

Seven woods from the elegance of their grain and colour, are suited to the various purposes of which mahogany is used, viz.

Cedrela toona. *Careya arborea*.
Swietenia chikrassa. *Barringtonia acutangula*.
Armoria dasycarpa. " *speciosa*.
Pterocarpus dalbergoides. *Castanea indica*.

And eleven are suited to the finer purposes of fancy cabinet work, viz.

Adenanthera pavonina. *Acacia stipulata*.
Calophyllum longifolium. " *catechu*.
Dolichampia pomifera. " *sericea*.
Pygium acuminata. " *elata*.
Photinia serratifolia. *Ricinus dioeca*.
" *Antidesma paniculata*.

Yellow woods are four in number, hard and fine grained, and suited to fancy purposes.

Gmelina arborea. *Morinda exserta*.
Morinda bracteata. *Garcinia cowa*.

The dark-brown woods are twelve in number and are all valuable. Eleven are adapted for house-building, and probably for ship-building and one for special purposes requiring great strength and hardness.

Pterospermum aceroides. *Butea frondosa*.
" *subacerifolium*. *Mangifera attenuata*.
" *acerifolium*. *Anacardium occidentale*.
Pentaptera arjuna. *Zizyphus jujuba*.
" *glabra*. *Averrhoa carambola*.
Melanorrhæa usitatissima *Pierardia sapota*.
Theetsee or *Lignum vitae*. *Ancistrolobus carnea*.
" " *mollis*.
Dalichampia pomifera. *Rondeletia tinctoria*.

The black woods consist of five different kinds, all of which are valuable for their strength and hardness.

Dalbergia, Species. *Inga xylocarpa*.
Cassia Sumatrana. " *bijemina*.
" *Diospyros melanoxylon*.

The light-brown woods are nine embracing all the timber of most value in the province, exclusive of teak.

Dipterocarpus alatus. *Dillenia augusta*, also *D.*
Dipterocarpus turbinatus. *scabra* and *D. speciosa*.
Shorea robusta. *Hopea odorata*.
Melicocca trijuga. *Azadarachta indica*.

The above list embraces all the useful timber

found in the forests of the Pegu province, except teak. The following trees may be had of any size and to any extent.

Sapindus acuminata. *Terminalia bellerica*.
Odina woodier. *Terminalia scevola*.
Dillenia augusta. *Hibiscus macrophylla*.
Dillenia scabra. *Grewia floribunda*.
Blackwellia spiralis. *Ficus macrophylla*.
Blackwellia perpinqua. *Ficus lanceolaria*.
Chytia amena. *Ficus congesta*.
Bombax pentandra. *Ficus glomerata*.
Connarus, species. *Ficus cordifolia*.
Nauclea parviflora. *Ficus nitida*.
Nauclea cordifolia. *Ficus usophylla*?
Nauclea undulata. *Ficus pilifera*.
Nauclea cadamba. *Ficus bifida*.
Uvaria ventricosa. *Ficus mamillaria*.
Bignonia spathodea. *Ficus oppositifolia*.
Bignonia coronaria. *Kydia culecina*.
Bignonia adenophylla. *Eliodendron*, species.
Sterculia alata. *Celtis tetranthera*.
Sterculia ornata. *Grewia nudiflora*.
Sterculia ramosa. *Strychnos nux vomica*.
Sterculia foetida. *Garcinia cowa*.
Sterculia balangas. *Dipterocarpus turbinatus*.
Sterculia guttata. *Dipterocarpus alatus*.
Ricinus dioeca. *Walsura piscidia*.
Artocarpus incisa. *Waltheria velutina*.
Artocarpus liquosa? *Macroclena spectabilis*.
Sandoricum indicum. *Dalbergia robusta*.
Pentaptera glabra. *Dalbergia frondosa*.
Pentaptera arjuna. *Lagerstræmia pyramah*.
Diospyros melanoxylon.

The town of Pegu, was captured on the 3rd June 1852. The races occupying British Burmah are the Burmese, the Talieng or Mon the Karen, and numerous mountain tribes, and tribes dwelling near the rivers.—*Winter's Burmah*, p. 16; *Report by Col. Phayre, Rangoon Times*; *Dr. McClelland in India Selections*, No. ix. See Amherst, Burmah, India, Idrawadry, Karen, Mon, Moulmein, Rangoon, Talieng.

PEGOO, TIB. The yak Cow—small, like the cow of Bengal. Hair long. *Sauh*—cross between cow and yak. *Sauh Yak*—produce of cow by yak bull. *Ba Sauh*—produce of female yak by bull. These are great milkers, better than yak or cow; tail half-cow, half-yak. Females give young with bulls or yaks, best produce with yaks. Elevation of shoulder less than in the yak. Hair long, but less so than the yak.

PEH-FEN, CHIN. White-lead.

PEHJABAH ISLANDS. Two small islets off the coast of Sumatra.

PEH-KIANG, CHIN. *Zingiber officinale*, *Roscoe*, *Roxb*.

PEH-LAH, CHIN. Insect-wax is a product of the province of Sz-chuen, where the tree on which it feeds, the Peh-lah shrub, flourishes, but though the insect thrives there, it is found necessary to keep up the supply of insects by the constant importation of eggs from beyond the western frontier of the province. The insect is about an inch in length, and of pale-grey colour and one insect exudes an ounce of wax in the season, of the summer months. The

is not affected by rain but, when the leaves fall it dies. The wax is then collected and melted in a cloth over boiling water. It is pure white. On the largest cakes in Hankow is often observed written, "it mocks the frost and rivals the snow." The price was 40 dollars a picul or about 15*d.* a pound. The vegetable tallow of which candles are usually made melts with great facility; in order therefore, to prevent them from running, they are coated with a thin crust of finest insect wax, which is extremely hard, and slow to melt, so that it retains the vegetable tallow in a liquid state and is a clean and economical ingredient.—*Oliphant*, p. 405.

PEHLEVI, an ancient language used in the time of Ardeshir now called Huzvarish. It was the ancient language of the Persians prior to the mahomedan conquest by the Khalifs, in A. D. 636. See Arian, India, Iran, Pahlavi.

PEHLWAN or phailwan, PERS. In ancient writings applied to a hero of romance, such as an Amadis de Gaul, &c., who performs feats of wonderful or superhuman prowess. But of late it has been used to less heroic characters: wrestlers, prize fighters, and bullies, as well as persons of great strength and courage.—*Fraser's Journey into Khorasan*, p. 376.

PEHMER, see Kandah rao.

PEHO. The two rivers Sha-ho and Peho, unite below Peking, and afterwards bear the latter name. The lake is that called Thai-tchi or Si-hai-tsu, to the east (west) of the imperial palace.—*Yule Cathay*, Vol. ii, p. 259. See Pehho.

PEHOA, or Prithudaka, near Thanesar.

PEE-T'UNG, CHIN. Zinc.

PEH-T'UNG-YU, CHIN. Wood.

PEH-YUEN, CHIN. Zinc.

PEH-YUEN-TAH, CHIN. Oxide of zinc.

PEI or Pey, also Pisacha, TAM. A demon. Though pey and pisacha are to a certain extent, interchangeable, yet people who are skilled in diabolical refinements draw a distinction between them. Pey, they say, means the ghost of a human being that has become powerful and malignant. It has a name and a place of residence, and is systematically worshipped. The pisacha, on the other hand, they say, has no home, or name, or worship. The bhuta, they add, is a demon of a higher order, an attendant on the brahmanical demon-gods. It is still more worthy of notice that pey has meanings which pisacha has not. In combination with names of plants pey means wild, uncultivated, useless for human food; in combination with names of animals it means insane. The use of a word in combination often throws light on its original meaning, it is possible that this application to plants and animals may be only a metaphorical transfer of the older mean-

ing of "devil." Still, in either case, the direct derivation of pey from pisacha, a word which is never used in this way, may be regarded as improbable.

PEIARA, BENG. *Psidium pyrifera*, Linn.

PEIGNES, FR. Combs.

PEIHO, or white river, disembogues into the Gulf of Pe-Tche-Lee, has four mud forts with about 100 guns, at its southern entrance. See Pe-ho.

PEING-NAI, BURM. *Artocarpus integrifolia*, Linn.

PEINI-MARM, MALAY. Syn. of *Vateria Indica*. Linn.

PEISHWA, or Peshwa, a title of the chief minister of the Mahratta kingdom. Sevajee, the founder of the Mahratta power, began his career as a plundering bandit at the early age of seventeen, and at the time of his death in 1680, he had established his power over the greater part of the Concan. He had few pretensions beyond those of a successful rebel against the declining mahomedan power. Most of his possessions were wrested from his son and successor Sambajee, who was taken prisoner by Aurungzeeb and cruelly put to death, and whose son, Saho or Sahojee, was carried into captivity. But the efforts of the emperor to subdue the Mahrattas, in which he persevered till his death in 1707, were unavailing. For although he succeeded in taking most of their forts, the Mahrattas under different leaders revenged and enriched themselves by incursions into the imperial dominions, and overran the whole country south of the Nerbudda. The ill-judged bigotry of Aurungzeeb, in provoking by religious persecution the Rajpoot princes of Malwa, favoured the cause of the Mahratta invaders. But it was chiefly during the weak reign of Mahomed Shah that the Mahratta supremacy was extended. Sahojee was released from captivity on the death of Aurungzeeb, but on his return to the Deccan, he found himself opposed by his cousin, Sevajee, and his aunt, Tara Bai. By the ability of his minister Balajee Biswanath, Sahojee succeeded in recovering his rights. Being addicted to ease

and pleasure, *Sahjee*, nominally the head of the Mahratta power, established himself at *Sattara* of which place his successors became titular rajahs; while the real authority and actual supremacy in the Mahratta confederacy devolved on *Ballajee*, in whose family the office of *Peishwa* became, as offices under the Mahratta rule usually did become, hereditary. *Ballajee Biswanath* died in April 1720, and was succeeded by his son, *Bajee Rao*, who held office for twenty years. The armies of *Bajee Rao* ravaged *Guzerat*, and completely reduced *Malwa*, of which province *Bajee Rao* was created *soubadar* by the emperor of *Delhi*, being aided in this by the policy of the *Nizam*, who wished to interpose the Mahrattas as a barrier between the court of *Delhi* and his own possessions. After overrunning *Bundelcund* and *Hindoostan*, and exacting a promise of *chout* or a fourth of the revenue of the *Delhi* empire, *Bajee Rao* returned to his southern possessions. He died in 1740, on the banks of the *Nerbudda*, when marching to renew his depredations in *Hindoostan*. A year before his death, the British Government concluded a treaty with him, principally of a commercial nature. *Bajee Rao* left three sons, *Ballajee Bajee Rao*, *Ragoba*, and *Shumsher Bahadoor*, an illegitimate son by a mahomedan woman. The last succeeded to the *Peishwa's* possessions in *Bundelcund*, and his descendants became the titular nawabs of *Banda*. *Ballajee Bajee Rao*, commonly called *Nana Sahib*, succeeded his father in the office of *Peishwa*, after some opposition from *Ragojee Bhonsla* and the *Guikwar* and on his accession he went through the mock ceremony of receiving investiture from the hands of the nominal rajah *Saho*. He was of an inactive disposition, and entrusted his internal government to his cousin, *Sedasho Rao Bhow*, and the command of his armies to his brother, *Ragonath Rao* or *Ragoba*. During this administration, *Angriah* of *Colabah* was reduced, in 1756, by a joint expedition of Mahrattas and English. In the time of *Bajee Rao*, the chiefs *Scindia* and *Holkar* had risen from a low position to be the principal leaders of the Mahratta armies under *Ragoba*. The whole of *Malwa* was divided between them and a few jaghiredars, of whom *Anund Rao Puar* of *Dhar* was the principal. The Mahratta influence was now supreme at *Delhi*, where the dissensions of the court had invited their interference. In 1758 the Mahratta conquests were extended as far as *Lahore* and *Mooltan* by *Ragoba*. But these aggressions provoked the fifth invasion of *Ahmed Shah*, *Abdalli*, at whose hands the Mahrattas sustained a disastrous defeat at *Paniput*, which for a time destroyed their power in northern India. This defeat was to some extent occasioned by a temporary exchange of

functions between *Ragoba* and *Sedasho Rao Bhow*. The *Peishwa* survived this disaster only a few months.

Balajee Bajee Rao, commonly called *Nana Sahib*, was succeeded by his second son, *Madho Rao Bullal*, then 17 years of age, under the regency of his uncle *Ragoba*. Shortly after his accession, his territories being threatened by the *Nizam*, the *Peishwa* became desirous to settle some existing disputes with the British which had arisen in consequence of attacks made on the *Sidee* of *Jinjeera*, an ally of the British government. The disputes were adjusted by treaty. Negotiations were also entered into by the Mahrattas with a view to obtain military assistance from the British, but they were suddenly broken off, the Mahrattas having in the meantime come to terms with the *Nizam*. *Ragoba* long endeavoured to keep *Madho Rao* in a state of dependence, but the talents and address of the latter enabled him to assume the administration which he held for eleven years. He died in 1772 without issue. The year before his death the influence of the Mahrattas was re-established in Upper India by *Scindia*, who overran *Rohileund*, detached the emperor *Shah Alim* from alliance with the English, and replaced him on the throne of *Delhi* where he held him in a state of tutelage. The death of *Madho Rao* was followed by the murder of his brother and successor, *Narrain Rao*, and the usurpation of *Ragoba*. A revolutionary party was formed by the chief ministers of the State in favor of *Gunga Bai*, widow of *Narrain Rao*, who after her husband's murder, gave birth to a son, *Madho Rao Narain*. *Ragoba*, on the other hand, strengthened his position by negotiations with *Scindia*, *Holkar*, and the British. Being deserted by *Scindia* and *Holkar*, *Ragoba* was fain to purchase the assistance of the British by ceding *Bassein*, the island of *Salsette*, and other islands on the *Bombay* coast, which the British had long but unsuccessfully endeavoured to obtain, and of which they had recently taken possession in anticipation of their being occupied by the Portuguese. The arrangements made were reduced to the form of a treaty on the 6th March 1775. Out of this treaty arose the first Mahratta war. The force which was sent to assist *Ragoba* gained some unimportant successes, which so pleased *Ragoba* that he presented to the British the districts of *Humot* and *Amod*, then estimated to yield Rs. 2,77,000 a year. But the successes of *Ragoba* were short lived. The Supreme government in Bengal disapproved of the Treaty and declared it invalid, and deputed an agent of their own, *Colonel Upton*, to negotiate with the ruling ministerial party at *Poona*. In the meantime the ministerial party split into two factions, one headed by *Nana Furnaves* and

Scindia, in support of the young Peishwa, and the other by Moraba, the cousin of Nana Furnaves, who was supported by Holkar and the adherents of Ragoba at Poona. By the vacillation of Holkar the party of Nana Furnaves gained the complete ascendancy.

Hyder Ali died in December 1782, but his son Tippoo although professing acquiescence in the terms of the Treaty of Salbye, continued the war with the British; and a new treaty was concluded in October 1783 between Scindia and the British on the one part and the Peishwa on the other, to enforce his submission in accordance with the 9th Article of the Treaty of Salbye. Before the provisions of this treaty could be carried out, the Madras government had made peace with Tippoo by the Treaty of Mangalore. This treaty, which was concluded without the concurrence of the Peishwa, the Mahrattas affected to consider a violation of the Treaty of Salbye, but the ambitious designs which the leaders of the Mahratta parties now began separately to entertain reconciled them to the arrangements which had been made. On the first appearance of a rupture with Tippoo in 1790, Lord Cornwallis directed his attention to an alliance with the Peishwa. A treaty of offensive and defensive alliance was concluded, to which the Nizam was admitted. The chief Mahratta leaders had now become allies rather than dependants of the Peishwa. Separate treaties had been concluded by the British government with the rajah of Berar, the Gaikwar and Scindia, and it is only as confederacies of equals acting against a common enemy that the Mahratta chiefs again appear united. The independence of Scindia was virtually recognised by the Treaty of Salbye, and his separate conquests in Northern India and Malwa, although nominally held by him as deputy of the Peishwa, gave him full control over the court at Poona. The young Peishwa, Madho Rao, died on the 27th October 1795, and this event was followed by dissensions which threatened the dissolution of the Mahratta confederacy.

In the war which broke out between Scindia and Holkar in 1801, the united forces of Scindia and the Peishwa received a severe defeat on the 25th October 1802. The crisis was opportune for the re-establishment of British influence at Poona, and overtures for a subsidiary force made by Bajee Rao, who had fled from Poona, on Holkar's approach, were favorably received. On 31st December 1802, the celebrated Treaty of Bassein was signed. By this treaty the Peishwa was to receive a subsidiary force of six battalions with guns, and was to cede for their payment territory of the value of Rs. 26,00,000. Bajee Rao was re-seated on the musnud at Poona on

13th May 1802. Holkar fled on the approach of the British force, and Scindia after hesitatingly expressing his acquiescence in the arrangements to be made under the Treaty of Bassein, in which he saw the destruction of his scheme for obtaining control over the Poona government, changed his plans, and formed a league with the rajah of Berar to defeat the treaty. The campaigns against these Mahratta chiefs in 1803, and Holkar in 1805, completely broke up the Mahratta confederacy, and established once for all the supremacy of the British power in India. The territories then conquered from Scindia and the Rajah of Berar were distributed between the British government, the Peishwa, and the Nizam, by the Partition Treaty of Poona in 1804. The Peishwa's share was the city and province of Ahmednuggur. The system of non-interference which the government had followed in Central India and Malwa greatly strengthened the Pindaree hordes, and in 1815 their inroads into British territory made necessary a change in the policy of government. The Pindarees looked much to the support of the Mahratta chiefs. But Scindia was detached from their cause by the Treaty of 1817, Ameer Khan was gained over by being guaranteed in his territories, the force of Holkar was broken in the battle of Mehidpore, and after a harassing war the Pindarees were completely broken up and their chiefs forced unconditionally to surrender. In the meantime Bajee Rao, smarting under humiliation to which he was subjected by the recent treaty, took advantage of the Pindaree war to break off his connection with the British government. On 5th September 1817, after having secretly made extensive preparations for war, he suddenly attacked and plundered the Residency at Poona. After a desultory campaign, in which Bajee Rao continued cleverly to evade the British troops, he was reduced to the utmost distress, and in May 1818 offered to throw himself on the generosity of the British government. He was offered, and he accepted, terms by which he resigned his sovereign power, and agreed to reside at some spot on the Ganges, receiving an allowance at Rs. 8,00,000 a year. Bithoor, near Cawnpore, was selected as the place of his future residence. The residents within the jaghire which was assigned to him at Bithoor were exempted from subjection to the ordinary civil and criminal courts of the country by Regulation I of 1832. Bajee Rao died on 28th January 1851. He bequeathed all his property to an adopted son, Dhoondoo Punt Nana, who was recognised by the British government as his heir. No portion of the pension granted to Bajee Rao was continued to his family. The jaghire at Bithoor, however was continued for

the life of Dhoondoo Punt, but the residents were made subject to the ordinary civil and criminal courts. Dhoondoo Punt is the notorious Nana Sahib who presided at the massacre of Cawnpore and took a leading part in the rebellion of 1857. His fate is uncertain.

It is a common impression among the Europeans in British India, that the newspaper press is a novelty in India, and its influence upon the proceedings of public men a thing only yet beginning, and not fully established.

Mahadeo Rao, Peishwa, the first of that name, reigned at Poona from 1761 to 1771. He was one of the greatest and best men of his time; an able warrior, a bold and fearless administrator and a most conscientious protector and father of his people; to whose misfortune he was carried off by sickness at the age of twenty eight. But his name is still held in veneration and had he lived, he might have made a great figure in history. He was one day seated on the Goolteree hill, near Poona, watching an elephant with his brother Narryen Rao, somewhat younger than himself, by his side, and all the chieftains of the court around. One of the elephants becoming angry, rushed towards the spot where they were standing, and all the officers, forgetting the respect due to the Peishwa, took themselves off with surprising rapidity. The young Narryen Rao rose to fly with the rest—but the Peishwa took him by the arm. "Brother," he said, 'what will the akhbars say of you?' The youth recollected himself, composed his countenance as none but a native can, and sat down again; for a Peishwa's brother may be squashed, but must not run. The danger (as Grant Duff describes) soon became imminent, but was averted by the extraordinary courage of a Mahratta sildar named Appajee Rao, Pahtunkur, who, drawing his dagger, sprang in front of the Peishwa, and turned the animal aside by wounding him in the trunk. The Peishwa declared that this incident gave him high hopes of his brother's future career, and that the brave lad would distinguish himself if he lived, but these two young men were cut off in early life before they were able to render the services to their country of which their virtues gave promise. The great pre-eminence in India which this extraordinary family acquired makes it absolutely necessary to conclude that there must have been some real heroism in their character and disposition to call it out; something at any rate beyond the mere cunning and audacity to which we are perhaps too much inclined to limit their claim to respect. And in truth when we turn to their history no doubt remains that they were very extraordinary men, possessing not merely ability but magnanimity and real patriotism. The first of them was

Ballajee Vishanath, who obtained the office of Peishwa and possession of Poona in the year 1714, was an able minister, among several able men whom India then possessed, and died in 1720. He was succeeded by his son Bajee Rao, a man who may fairly be compared with Sivajee, as the second great consolidator of the Mahratta empire and whose career is one of the most romantic and extraordinary in history. He conquered Malwa and Bundelcund, and appeared, to the terror of the Mogul Emperor before the gates of Delhi; obtained a claim to a share in all the revenues of the Deccan; and compelled the veteran warrior Nizam ool Mulk in a most ably conducted campaign to surrender almost at discretion. Under his rule Scindia and Holkar rose to eminence; the former though of good family, was not very rich, and served originally as a simple sildar, and was even entrusted, as tradition has it, with the care of the Peishwa's slippers. Bajee Rao died April the 28th, 1740. The extraordinary eminence of his talents, in contrast with the indolence of his master the raja Shao, caused the whole power of the state to be centred almost naturally in his hands; and a few years later the revolution in the reigning family which took place on Shao's death made the power of the Peishwas easily paramount.

Ballajee Bajee Rao his successor, was almost his father's equal; and it was under his reign, which lasted twenty years, that the fruits of his able administration were reaped, and the Mahratta empire extended to its widest limits. Nagpore had been conquered long before: Orissa and Bengal, Rajpootana, Rohilcund and Lahore were now successively laid under tribute. Under the "Nana Sahib," as Ballajee was then and is still generally called, the revenue of the Mahrattas rose to ten crores of rupees in one year, including exactions from foreign powers, he realised thirty-six. But it is his distinguishing glory that under his rule the country first obtained that tranquillity which is necessary to secure anything like prosperity, and the peasantry of the Deccan even yet regard his memory with gratitude, as the first ruler who obtained for them the blessing of peace after many ages of anarchy and trouble.

At last, however, these great successes ended in a reverse still more memorable. There was no power in India that could withstand the Mahrattas; but one such entered from the north-west, and contested with them the supremacy over Delhi. Only a few months before, a great Mahratta army, having amongst its officers the Peishwa's cousin Sudasew Rao for its commander, and the Mulhar Rao Holkar, several of the Sindia's, the Guicowar, Powar of Dhar, the Vinchoorkur, the Poorundhuree, and all the noted Mahratta chiefs, had taken Delhi; one of the

chiefs had even proposed, perhaps in jest, to place Viswas Rao, the Peishwa's eldest son, who was also with them, on the throne of Aurungzeeb. But the formidable army appeared of Ahmed Shah, king of Cabul. The two armies met at Paniput on the 7th of January 1761, and on that fatal field the supremacy of the Mahrattas was lost for ever. Such of the survivors as returned to the Deccan left two hundred thousand of their dead behind them. The Peishwa's son and cousin, and the Dhar chief were among the slain. Ballajee Rao was crossing the Nerbudda northwards (for some reports of the impending danger had reached him, and he was bringing an army to the assistance of his friends) when a soucar's kassid was encountered with a note for some one in Aurungabad. The Peishwa opened it and read:—"Two pearls have been dissolved; twenty seven gold mohurs have been lost; of the silver and copper, there is no counting up the sum!" and the arrival of fugitives from the army soon placed the matter beyond a doubt, and all Maharashtra was in mourning. The old Peishwa never recovered the shock. He retraced his steps to Poona, and died at the temple of Parvati, which he had built, in June of the same year.

He had three sons, Viswas Rao, killed at Paniput; Mahadeo Rao, and Narayen Rao the two brothers already mentioned and who successively held the office of Peishwa. Mahadeo Rao was distinguished in the field, but he was more distinguished by his not less intrepid and determined warfare against the corruptions which had crept into the administration. He had one quality which is a sure mark of greatness—the perception of great qualities in others, so that when himself almost a boy he was able to make the best possible selection of ministers. One of these was the celebrated Ram Shastree, who held the judicial administration—a man perfectly incorruptible, and on whose virtues there was no stain ever known to rest. He revived the punchayet system, and originated and consolidated that excellent code of caste law which has since been translated and explained by the learned labours of Professor Buhler. Mahadeo Rao died in 1771, and Narayen Rao succeeded, only to fall a victim to the ambition of an unscrupulous woman. This was Anundee Bhai, wife of his uncle Rugonath Rao, or Rugoba. Rugoba was not a wicked, but he was a very weak man. He allowed his wife to persuade him to arm her with a written order empowering some one or other to seize the person of the young Peishwa; but having obtained it, she altered the word "dharawe" into "marawe." The paper is still, it is said, in the Poona duffer, with the fatal correction plainly visible; and there is no Mahratta who does not believe that it was the hand of Anundee Bhai that made it. The

consequence was that the young prince was slaughtered almost in his uncle's presence whither he had fled for refuge, in the now dismantled palace in the city of Poona, in the eighteenth year of his age. Rugoba did not reap the reward of his guilt; he was indeed proclaimed Peishwa, but public indignation was too strong to allow him to retain the sceptre. He was met too by a difficulty which it was strange he did not foresee; Narayen left a widow pregnant, who easily obtained the support of a party among the ministers, and was conveyed to the fort of Poorundhur, where in 1773 she was safely delivered of a son—Mahadeo Rao the second. A year later Anundee Bhai also, whilst at Dhar, produced a son who became in his turn the second Bajee Rao. During the minority of these youths the government was administered by Nana Furnaves. The tragical end of Mahadeo Rao while still a youth, and the excitement among the people which followed, and which enabled Bajee Rao to assume the administration of the government, his disastrous reign, his fall, and the peaceful but inglorious end of his career,—are well-known. Of all the Peishwas he was—the last and the worst; a most unworthy termination to a succession of great men. After the murder of Narayen Rao, Rugonath, his uncle, appointed the incorruptible Ram Shastree to investigate it. The judge came to make his report. "Well," said the Peishwa, who did it?" "you yourself," said the Shastree; "here is the order in your own hand-writing!" Rugonath admitted his partial complicity; he had given the order for the Peishwa's apprehension; and asked what atonement he could make. "Your own life!" said the indignant Shastree; "for you can be of no further service to your country, and you will never prosper as long as you live!" Nor did he. The Shastree added that he himself would neither enter Poona nor accept any employment while Rugonath bore rule. He kept his word, and retired to a sequestered village near Wasee. The private life of Ballajee was stained with gross sensuality.—*Aitcheson's Treatise, &c., pp. 1-10.*

PEITEIRA MANJO, also Peities manjo, *Maleal*. *Anacardium occidentale, Linn.*

PEK, HIND. *Plectranthus rugosus.*

PEKA BANS, HIND. *Dendrocalamus tulda, Nees.*

PEKARA, TAM. *Terminalia paniculata, W. and A.*

PEKEA, a genus of plants inhabiting Guiana, and furnishing the Saouari or Sawarra nuts of the shops, a very different fruit from that to which the name of Saouari is given in Guiana. Pekea comprehends two species, the *P. butyrosa* and *P. tuberculosa*: the latter,

which yields the fruit in question, is a very large tree inhabiting the woods of Guyana, where it is called *Tatayouba* by the Garipou Indians. The fruit consists of greenish compressed drupes, which adhere around a common centre, and contain a single seed of large size, covered with a brownish rugged woody shell, and enclosing a kernel of a soft consistence, and of the most delicate buttery quality. It is much superior to English walnuts, almonds and filberts. *Pekea buttyrosa*, is a large tree with a trunk 80 feet high, and 3 feet in diameter. The berries are covered by a rind two or three lines thick, and consisting internally of a buttery yellowish substance, which melts between the fingers, and which is sometimes used in cooking instead of animal butter. Under the rind lies a stone covered all over with slender stings, which easily separate, and become very troublesome to those who open the stones; within is a kidney-shaped kernel covered with a brownish membrane, and very good to eat; it is commonly served at table. It is called *Pekea* by the blacks in the neighbourhood of Oyapoco in French Guyana, where it is much cultivated. The species that furnishes the Butter-nuts of the London markets is much like this, but is called *Tata-youba* by the natives of Guyana, and differs in having no stings upon the surface of the stone of its fruits: this is the *Pekea tuberculosa* of Aublet; the *Caryocar tomentosum* of modern botanists. Another species, *Caryocar nuciferum*, bears what are called the Suwarrow, or more properly Saonari, nuts of commerce. It has only three leaflets to each leaf, each with a toothed margin and a taper-pointed extremity; the flowers are very large, deep brown externally and rich crimson in the inside; the fruit is in form like an egg, covered with a thick rough brown rind, beneath which is a soft greenish buttery substance. The nut has a stinging surface, and contains a very excellent kernel, from which may be extracted an oil like that from sweet almonds. These plants might with advantage be introduced into India.—*Eng. Cyc.*, p. 790.

PEKI (*Alnus*), *sp.*

PEKING or Peking in lat. 39° 54' N., long. 116° 32' E., lies N. W. from the entrance of the Peiho river, about 114 or 120 miles inward. Peking means court of the north, and Nankin that of the south, both of them large towns.

Europeans are in the habit of associating with this capital the idea of a city distinguished among all others, by the beauty of its buldings, the width of its streets, and by the animated life within its walls. Peking resembles every other Chinese city, and is still more like an immense village. The city is situated in a large plain, but from the peculiar formation of the land, it is not to be seen from a distance;

and there is nothing to indicate the approach to a capital, excepting perhaps the funeral processions that one continually meets. The first objects which strike the eye of the traveller are the battlemented walls, and the gates crowned with lofty towers. The wall is of a considerable height, thirty-five to forty feet, and surrounded by a canal which communicates with the Peiho, so that a portion of the supplies intended for the capital can reach Peking in very light boats. Peking consists of two cities, separated by a wall—the Mantchou city, Zein-tchau, and the Chinese city, Wai-lo-tchau. In the centre of the former, surrounded by a wall, is the Imperial quarter, Nouanchau, composed exclusively of buildings set apart for the emperor and his suite, whose roofs, covered with yellow tiles, glitter in the sun's rays like burnished gold. All these edifices, kiosques, and temples, are surrounded by gardens, ornamented with lakes and artificial rockwork. Among these is the famous Lake of Water-lilies, a marshy pool, covered with the water plants from which it derives its name. The aspect of the imperial city was doubtless magnificent a few centuries ago, but now everything is in a state of decay owing to the impoverished condition of the treasury. In the Mantchou city, not far from the imperial quarter, are the different departments of government. There reside all the Mantchou employees, and there also are the two establishments with the two churches of the Russian Mission. To the east of the Mantchou city is the Hall of Examination, similar to the one at Canton, but more spacious; there are, besides, shops and restaurants neither remarkable for elegance or cleanliness. The principal streets of Peking are wider than those of other Chinese cities; but the numerous stalls erected in these thoroughfares leave little vacant space. The streets are unpaved and the alleys narrow. During the autumn, winter, and spring the dust is a source of great annoyance, and in the rainy season, the streets are almost impassable: all refuse matter is thrown into the public ways, impregnating the air with miasma.

The Chinese city, consisting mostly of shops, has still less attractions. There, however, is to be found the only street that has been paved with granite blocks, leading from the Imperial palace to the temples of Heaven and Agriculture, at the south of the city. These temples are large establishments, (also surrounded by walls,) comprising several buildings in themselves. The traveller to Peking, who has visited the ports open to foreigners, is particularly struck with the absence of life, and bustle in the streets. It is believed that Peking cannot now boast of more than a million inhabitants, so many having been driven from the capital

by the increased dearness of living. Beggars, for the most part without clothes of any description, and stricken with hideous diseases, make out a miserable existence in the filth and garbage of the streets. These beggars are under the authority of a chief, and are forbidden to sleep within the city.

The most remarkable spot about Peking is the Hai Dian, the residence of the Bagdochan, His Majesty the emperor, situated about seven miles west of the city. The emperor only appears in the capital on occasions of great festivals, or sacrifices. There are two roads leading to this residence, one of which is in tolerable repair, and in the morning presents an animated scene. High officials, with their followers, going to or returning from the palace; a multitude of well-dressed retainers, and handsome equipages, indicating the presence of the court. The grounds around the palace are laid out in vast gardens, which, although better cared for than other parts of the capital still show signs of neglect, and high walls surround the whole. Still further to the west lie a range of mountains, whose summits are crowned with temples more or less picturesque; and here, as well as in another range extending northwards, the Russian missionaries generally pass a part of the summer and autumn. Seven miles to the south of the city is a large deer-park belonging to the emperor, of twenty-six miles in circumference, also surrounded by a high wall. Within are palaces and villages, whose inhabitants are charged with the care of the animals. Eighteen miles north of the city is a mineral spring with a large garden and an imperial palace, formerly the resort of the emperor Kansu, but now all in ruins. In the country around, the inhabitants are peaceful, good-natured and industrious. The ministers and great functionaries of state govern without control, and nothing comes before the emperor save through their hands.

The existing Tartar city at Peking, officially Nei-chhing or "Inner-town," encloses a second called Hoang-chhing or "Imperial (yellow,) town," which, no doubt, represents the outer palace of Odoric's day and that includes a third called Fseu-kin-chhing, or "Red City," which is the actual residence. The Green Mount, to which Kublai caused remarkable trees of every bulk to be transferred still stands conspicuous within the palace walls of Peking. "The eye rests with pleasure upon this round, wood covered, hill, rising picturesquely from the middle of the glittering roofs and umbrageous trees within the palace walls." It is called by the Chinese King-shan, "Court Mountain," Wan-shan, "Ten thousand years Mount," or Mei-shan, "Coal Hill," the last from the material of which it is traditionally said to be composed,

as a reserve store in case of siege. It rises 160 feet above the natural soil, and on it the last Ming emperor met a miserable end. The lake also (called Thai-i-chi) still exists as a swampy hollow, and the "beautiful bridge" is there in decay. In the Peking, or court, pronunciation, the sheng differ materially from those in the Canton and Fuchien dialects. In the court pronunciation, only four sheng are heard: in the Nankin, five; and in the Canton and Fuchien seven or eight. The sheng are produced solely by the sinking, rising, or non-alternation of the sound. The Peking dialect is, in reality, the standard spoken language of the country, holding the same place in China that the London English, as spoken by the educated classes does in Britain.—*R. in North China Herald*, June 30; *Swinhoe, North China Campaign*, p. 353; *Polo*, i, 10; *Expédition de Chine par P. Varin*, 1862; *Davis*, ii, 75; *Timkowski*, ii, 154; *Panthier, Chine, Moderne*, p. 19, quoted in *Yule Cathay*, Vol. i, p. 129; *Meadow's Desultory Notes*, p. 41, 59-60.

PEKKAR, HIND. *Adhatoda vasica*.

PE-KOIL, TAM. A demon temple. See Hindoo, Pe, Peisachi.

PEKUL equal to 133½ lbs., avoirdupois.

10 Cash	= 1 Candarin	16 Tail	= 1 Catty.
10 Candarin	= 1 Mace.	100 Catty	= 1 Pekul.
10 Mace	= 1 Tail.		

PE-KUMATI, MALEAI, TAM. *Citrullus colocynthis*, *Shreed*.

PELA, MALEAI. *Psidium pyrifera*.

PELA CHAMBELI, HIND. *Jasminum chrysanthemum*.

PELAMIS BICOLOR, *Schneider*. An innocuous snake of the Nicobar islands.

PELAN. A very hard, fine, close-grained, heavy, Ceylon wood.

PELARGONIUM, a genus of plants usually called geraniums. Many species of this genus, thrive well in India and are easily raised from seed, the Horse-shoe and Oak-leaf bear flowers abundantly, but it is generally remarked that plants grown from English seed do not blossom. Many of the species thrive well when put out in the garden, but are better for being grown in large pots, and if so placed, as only to receive the morning and evening sun, will blossom most abundantly. The tubers of *Pelargonium triste*, are eaten at the Cape of Good Hope.—*Riddell*.

PELASGI. Ancient Greek races, whose language and civilization were the prototypes of Hellenism and Ionianism. Pococke derives this name from Pelasa, the ancient name of the province of Bahar. Pelasgus, the ancestor of the Pelasgi, is said by Asiatic the Greek poet to have sprung from the black earth, a.c. 700.

PELAU, also Pe-lau-pe-nangwa, BURM. *Bambusa nana*, *Roxb*.

PELEEBHEET, in Kumaon.

* **PELEG.** The Partition, is a scriptural term, according to Chevalier Bunsen, alludes to the branching off of the race of Arphaxad, (the Joktamidæ) which passed into South Arabia.—*Bunsen.*

PELICAN, a genus of birds of the family Pelecanidæ. The Pelican is said to breed on palmyra trees on the Godavery, in the midst of populous villages, within reach of the hand. The Pelicanidæ are as under:

Pelicanus *crispus* of E. Europe.
" *inflatifrons*, *Blyth.*
" *javanicus*, *Horsf.* Lesser white pelican.
" *mitratus* *Licht.* Crested pelican.
" *onocrotalus*, *Linn.* European pelican.
" *philippensis*, *Gmel., Grey.* "
" *sinensis*—China.

PELICANUS INFLATIFRONS, *Blyth.* A remarkable species of Pelican, was seen by Mr. Blyth in the menagerie of the maharaja of Burdwan, in company with specimens of *P. javanicus* and *P. crispus*. It is generally similar to *P. javanicus*, but has the frontal skin curiously inflated, so as to present somewhat the appearance of a largely developed frontal knob of *Anser cygnoides* only feathered; and a further difference consists in the naked skin of the cheeks and pouch being yellowish white, whereas in *P. javanicus* that of the cheeks is deep purplish or livid carneous and of the pouch intense yellow.—*Jour. B. As. Soc., Nov. 1856.*

PELICANUS JAVANICUS, *Horsf.* A visitor to India. Adams saw them in pairs and in flocks, daily on the river, sailing leisurely down some narrow channel, their great bills resting on their crooked necks, or, scared at his approach, sought a safer retreat among the shallows and sandbanks far ahead. Their flight is in general heavy and laborious. In many the bill is bright orange—in some of a leaden-gray colour varying with age. The two species are not easily recognised until observed closely; the roseate hue, however, of the white pelican distinguishes it from the Dalmatian, which is perhaps the more common.—*Adams.*

PELICANUS PHILIPPENSIS, *Gmelin.* The grey pelican inhabits all British India and is the most abundant of all the pelicans.

PELICANUS SINENSIS, or fishing cormorant of China, white throat; the body whitish beneath, and spotted with brown; the tail rounded: the irides blue; the bill yellow.—*Baron; Macartney's Embassy, Vol. i, p. 27.*

PELIJUREE, *HIND.* Root of *Thalictrum foliolosum*. A native of the Himalayas, is used as a febrifuge and a tonic aperient.—*Ben. Phar.; Simmond's Dict.*

PELLA CAMUDI, *MAL.* *Cacalia sonchifolia.*

PELLA CHIKUR-KAI, *TEL.* *Lablab cultratus, DC.*

PELLA-GOMOODOO, *SINGH.* *Antidesma diandrum.*

PELLEJOS, *Pieles, Sp.* Hides.

PELLES, *Port.* Hides, skins.

PELLES, *LAT.* Hair.

PELLEW, *Peeloo'* or Palaos islands, form a chain of islands on the N. W. coast of New Guinea, and extend nearly 87 miles. Most of them are rather low, but they are cultivated and inhabited.

PELLI, *Ir.* Skins.

PELLITORY.

<i>Akurkurra,</i>	<i>AR.</i>	<i>Pietro: parietaria,</i>	<i>IT.</i>

<i>Pyrethrum,</i>	<i>ENG.</i>	<i>Anacyclus</i>	"
<i>Pyrethre,</i>	<i>FR.</i>	<i>Akkaraputta,</i>	<i>SINGH.</i>
<i>Zahn-Wurtzel,</i>	<i>GER.</i>	<i>Akkarakarum,</i>	<i>TAM.</i>
<i>Akulkurra</i> or <i>Akkurkurha,</i>			
<i>Guz, HIND.</i>			

A plant of North Africa, of the Levant, Barbary, Persia, and the south of Europe, cultivated for its root, which is used in medicine as a masticatory and a stimulant. The root is without smell, and when dry, it is some inches long, tough, fibrous, of the thickness of a quill externally gray, internally white. Pellitory is to be found in most Indian bazaars, it being an export from Mocha to Bombay. The Tamil, Arabic and Dukhani appellations are nearly the same. The Vytians prescribe an infusion of Akkaracarum in conjunction with the Lesser Galangal and Ginger as a cordial and stimulant in the lethargic stage of typhus fever and in paralytic affections. They also use it as a masticatory for the tooth ache.—*Ben. Phar.; Faulkner; Ains. Mat. Med., p. 34.*

PELLEVANDRUM, (a blister) in Ganjam.

PELO, *Ir., Sp.* Hair.

PELOA, *MALAL.* *Careya arborea, Roxb.*

PELO DI CAMELLO, *Ir.,* or *Lana de Camelo, Sp.* Camel's hair.

PELON, *MALAL.* *Caryota urens.*

PELOPÆUS, or Dirt dauber, a genus of neuropterous insects, constructs earthen cells side by side, and sticks them on walls and rafters.

PELOPÆUS SPINOLEA. Wasp-Mason.

PELTINI, *Ir.* Combs.

PELTOPHORUS GRANULARIS, *Beauv.* *Manisurus granularis, Linn.*

PELUSIUM, an ancient port on the Red Sea.

PEMAYRUTI, *TAM.* *Anisomeles malabarica.*

PEMBA, called Keddri or Ul kuthera. A low well wooded and fertile island on the coast of Africa, extends from lat. 4° 52' S. to 5° 29' S., and is in long. 39° 44' to 39° 42' E.

PEMBERTON. Author of a Mission to Bootan, *As. Jl.* 1840, vol. xxxi, part 1, 81. Of a report on the eastern frontier of British India. *Lond. Geo. Trans.* 1838, vol. viii, page 3, 391.

PEMBANOO, a root of Arakan from which an arrowroot is prepared and sold at four rupees the maund. The root is obtainable in large quantities.

PEMMICAN. Preserved meat.

PEMPHERIS MOLUCCA, *Cuv.* Length 3½ inch. Inhabits sea of Penang, Moluccas, Batavia and Japan. Its air-vessel is large and thick.

PEMU, TEL. Calamus rotang, *Linn., Roxb.*
PEN.

Plumes a écrire,	FR.	Penne da scrivere,	IT.
Schreibfedren,	GER.	Pera stwoli,	RUS.
Kulm, Guz., Hind., Pers.			

Pens for writing formed of the quills of the goose, swan, fowl, or other bird. Metallic, now extensively used, are manufactured in vast quantities at Birmingham, London and Sheffield, the materials used being steel, copper, brass, gold, zinc. Pens for writing in the Arabic and Persian and Deva-nagari characters are made of reeds and the pens or styles for writing on palm leaves are points of steel.

The reed pens for writing Persian are called

Beroo,	DUK.	Perin nanil,	TAM.
Burro, Kulm, Hind., Pers.		Pedda rolloo,	TEL.

The reed pens used by all mahomedans in writing the Arabic or Persian character, are the product of the *Saccharum sara*, a thin hollow jointed reed. Persian reeds or pens are most esteemed, being tougher and capable of being used much longer than the Indian reed. The *Arundo karka*, *Linn.*, is also similarly used in Sind. Jeremiah, xvii, 1, says: 'The sin of Judah is written with a pen of iron.' In many parts of British India and in Burmah, iron pens are alone used, forming the letters, by making incisions into the palm leaf. Books thus written are very durable. This pen is broad at the top, and at one side is sharp like a knife, to prepare the palm leaves.—*Ains. Mat. Mec* p. 194.

PENÆA SARCOCOLLA.

Ansarut,	PERS.	Gosht khorn,	PERS.
----------	-------	--------------	-------

—*Powell's Hand-book*, Vol. i, p. 378.

PENÆUS, a genus, of the crustacea, viz.:

Penæus canaliculatus, *Edws.* Celebes, Mauritius,
" *monoceros*, *Edws.* India.
" *indicus*, *Edws.* Coromandel.
" *monodon*, *Edws.* Indian coasts.
" *affinis*, *Edws.* Malabar.
" *brevicornis*, *Edws.* Indian coasts.
" *crassicornis*, *Edws.* Indian coasts.
" *styliferus*, *Edws.* Bombay.

PENANCE, called *Tapas*, practised by gods, Rishis, Rakshasas and men, to obtain boons.

PENANG, MALAY. Betel-nut, Areca nut, Penang nut.

PENANG, also called Pulo-Penang and Prince of Wales' Island, an island in lat. 5° 25' N., long. 100° 19' E., is about 15 miles in length, and from 7 to 12 miles in breadth. It contains a population of about 40,000, and

until the year 1870, was a dependency of the Bengal presidency, under the Governor of Singapore. George Town, the capital of Penang, or Prince of Wales' Island, a portion of the province of Wellesley, on the west coast of the Malay Peninsula. In 1870 it was changed to a crown colony. The flagstaff of the fort is in lat. 5° 24½' N., long. 100° 21' E. The harbour is nearly 2 miles broad. The island was presented to Captain F. Light, by the king of Queda, and taken possession of, by him, in 1786, for the E. I. Company. High water at springs occurs at 2½ hours, and with a rise of 7 or 8 feet. Penang is nearly 15 miles long and 7 or 8 miles broad. It has two islands, Pulo Jerajah and Pulo Ramio near the south-west point. Bell Retiro or Government Hill, 4½ miles west of the fort, is 2,550 feet above the level of the sea, and West Hill, lying a mile further west, is 2,713 feet. Horsburgh states Flagstaff Hill to be 2,170 feet. The rainfall on the hill of Penang was in one year 116·6 inches, and on the plain at its base only 65·5 inches, while in Province Wellesley, on the opposite coast, the amount was 79·15 inches. At Singapore the fall is 98 inches, and at Malacca the same. On the south coast of Sumatra, and on the north-eastern face of the Peninsula, the fall is probably much greater. The mean temperature of Singapore is 79·7°, and the temperature of the different months differs very little from the mean of the year. The atmosphere is always surcharged with moisture. The island, has a small bird, not larger than a linnet, that sings most sweetly, perched among the branches of the teak. Nothing can exceed the beautiful luxuriant vegetation of this island, which when ceded to the British in 1786, by the rajah of Queda was an uninhabited forest. On Penang hill 2,700 feet above the sea, the climate is very fine, and the scenery beautiful, the ascent is easy and the road good. Superb specimens of arborescent ferns (the varieties of this plant exceed 300 on the island) noble cypress, a species of fir resembling the larch, wild fruits and flowers line the ascent—the traveller looks down from the summit of Penang Hill on province Wellesley opposite the Strait. Malacca is 250 miles from Penang and Singapore half as much farther. Province Wellesley is twenty-four miles long by eight in breadth. Until lately Penang supplied the London market with nutmegs, but coconut trees have taken their place. Tapioca, for the American market, has been grown to a great extent in the province, realizing fortunes to the planters. Water is brought by pipes into the town from the base of the hill six miles off, and there is a plentiful supply throughout the year. Penang like the other settlements in the Straits, is a free port; In addition to the rapidly increasing produce

from Province Wellesley of tapioca, sugar, &c., tin and spices are brought from the surrounding islands for final shipment to Europe. One rather singular export from the port of Penang is eggs. They are preserved when freshly laid by being covered with mud or ashes an inch thick, made into a paste with water. They keep for years in this state, their salt-casing being removed only when they are about to be used. The great sources of revenue in the Straits' Settlements are the opium and excise farms. Land is sold outright for six rupees an acre, subject only to a tax of one-tenth of the profits for municipal purposes. The Chinese and Malays are confirmed gamblers, and hitherto it has been found quite impossible to put a stop to it. 18 furniture woods, grown in Penang, were sent to the Exhibition of 1851.

Angsena, or Senna	Durian (wild.)	Baloh.
Baymah.	Ebich-tree root.	Mirlimoh.
Baloh Bungah.	Ebony.	Penang wood.
Kulim.	Guava wood.	Ranggas.
Betel-nut tree root	Ibool wood.	Siam wood.
Clove tree.	Kauuning.	Tipbusi.
Cocoa-nut tree root.		

Colonel Frith of the Madras Artillery obtained the following woods.

Brantey.	Dunorhung	Pinang Bach.
Bunho.	Hama Raja.	Pala Utan.
Bintagor.	Maddang Kamen-	Papisrang.
Curupas.	hir.	Penang Teak.
Coorin.	Miraban.	Penang Jack.
Chinjeritt.	Maddang Tan-	Rangha.
Cumpas.	dack.	Rokam.
Cawa-Arang.	Maskaw.	Red wood.
Canis.	Mankadu.	Sankuang.
Chiuray.	Maliler.	Satin wood.
Cocoa-nut.	Maribot.	Siam ebony.
China red wood.	Mandara.	Teak.
Ceylon ebony.	Nebong.	Tampinnis.
Damarlout.	Pasu Lanija.	Tija.
Drum.	Pala.	

About the year 1850 cocoanut planting commenced in earnest to supersede spice cultivation in Penang and it has been an excellent substitute for spice planting and land has been planted with cocoanuts which formerly was used for grazing and other purposes. There is very little more available land in the plains to plant; nor is the value of property less than it was in the best days of spice planting.—*Woods of Penang by Colonel Frith; Rambles in Java; Wathen's Voyages*, p. 144.

PENANG JACK. Wood of a yellow colour. Used only for ornamental furniture.—*Col. Frith.*

PENANG LAWYER. The walking stick, so well known by this name, is a young plant of the *Licuala acutifida*, the *Plass tikoos*, of the Malays. It is a miniature palm, inhabiting Penang, and attaining generally only three or five feet, but in exceptional cases from fifteen to twenty feet in height. The "Penang lawyers" are prepared by scraping the young trunk with glass, so as to wholly remove the epidermis, and nothing more, the inside being

the substance of rattan. It is on this account that the smaller thin sticks are so much more sought after than the larger thicker ones, and are so rare. The sticks are ultimately straightened by fire, and then polished. The sticks are imported into England as walking sticks, and are much valued there. About 400 reached Liverpool annually, from 1851 to 1855.—*Seeman.*

PE-NANG-WA, BURM. *Bambusa nana*, *Rostr.*

PENARU PALAM MARAM, MALAYALA.

A tree, used at times by the natives of Malabar, but is of little value.—*Edye, Forests of Malabar and Canara.*

PENASTER, see *Pinus pinaster*.

PENAR-VALLI, TAM. *Zanonia indica*.

PENATES. Amongst the Romans the gods were arranged into *Dii majorum gentium*, and *Dii minorum gentium*. The *Dii majorum gentium* were the great Celestial deities and those called *Dii Selecti*. The great Celestial deities were twelve in number: Jupiter, Juno, Minerva, Vesta, Ceres, Neptune, Venus, Vulcanus, Mars, Mercurius, Apollo and Diana.

The *Dii Selecti* were eight, Saturnus, Janus, Rhea, Pluto, Bacchus, Sol, Luna and Genius, the daemon or tutelary god, who was supposed to take care of every one from his birth, during the whole of life.

Nearly allied to the genii were the *Lares* and *Penates*, household gods, who presided over families.

The *Lares* of the Romans appear to have been the manes of their ancestors, and there were *Lares domestici et familiares*, *campitales et viales*, *militares et marini*; small waxen images of them were made, and covered with dog's skin, and at festivals brought to the hearth and sacrifices offered to them.

The *Penates* were of two kinds, *Patrii penates*, *familiares que*. Those of the ancestors were worshipped in the innermost part of the house, which was called *penetralia*, also *impluvium* or *compluvium*. The city and temples were under the protection of the *Publici penates*, and these were worshipped in the Capitol.

The *Dii minorum gentium* were *Dii indigetes* or heroes, of whom were Hercules, Castor and Pollux, Æneas and Romulus, as also the Roman emperors.

The gods called *Semones*, were Pan, Faunus, Sylvanus, Vertumnus, Pomona, Flora, Terminus, Pales, Ilymen, Laverna, Vacuna, Averuncus, Fascinus, Robigus, Mephitis, Cloacina also Nymphs, in the earth, Oreades in mountains, Dryades in woods, Hamadryades, Napeæ, Naiades, Nereides and Oceanides, and each river had a particular deity. The *Semones* also included the infernal Judges, Minos, Æacus

and Rhadamanthus, Charon and Cerberus also the virtues and affections such as Piety, Faith, Hope, Concord, Fortune, also foreign deities, the winds and the tempests, Eurus, Auster or Notus, Zephyrus, Boreas, Africus, Corus, Æolus and Auræ.

The Romans worshipped some gods that they might do them good, and others that they might not hurt them, as Averruncus and Robigus. There was both a good Jupiter and a bad, the former was called Dijovis or Diespiter and the latter Vejovis or Vediovis, but Ovid makes Vejovis the same with Jupiter parvus or non magnus.—*Adam's Roman Antiquities, 8th Ed., pp. 228 to 234. See Hindu.*

This is grown over all British India and up the Sutlej valley between Rampur and Sungnam to an elevation of 5,000 feet. Its grain is reckoned more delicate and of a less heating nature than sorghum: like it, it is made into cakes and porridge. Park, in his *Travels in Africa*, informs us that the natives of some parts of that country prepare from this grain a kind of malt, which they use for making beer.—*Cleghorn's Punjab Report, p. 66; Ainslie, Vol. ii, p. 218; M. C. C.; O'Shaughnessy, p. 637; Elphinstone's History of India, p. 12.*

PENINSULA. In the south and east of Asia, there are several peninsulas, that of Arabia, the peninsula of Guzerat, the peninsula of India, and that of Malacca, India, south of the Vindhya range and of the Nerbudda, is termed the peninsula by the British, but the northern hindoos and mahomedans call it the *Dakshana*, or *Dekhan*, or south. At its broadest part, in the twenty-second degree of north latitude, it is twelve hundred miles across, but it tapers away towards the south and in latitude 7° 40' north, ends in the Promontory of Cape Comorin, the Indian Ocean washing its western and the Bay of Bengal its eastern shores. A range of mountains runs along

each side of this peninsula, parallel with the coast, leaving between them and the sea in their whole length from north to south, a belt of low level land from twenty to fifty miles in breadth. These two mountain ranges are termed the Eastern ghauts, and the Syhadri mountains or Western ghauts, and have an average elevation of 1,200 to 3,000 feet respectively, but solitary mountains and spurs from the western range attain an elevation of 6,000 and 8,000 feet above the level of the sea. The western ghauts, on the side next the sea, are scarped and at places sink precipitously 2,000 feet to the level belt below. The Eastern ghauts do not fall so abruptly, but both ranges are covered with thick impenetrable forests through which a few passes lead from the coast into the interior of the country which is upraised by the mountains into table lands from 1,200 to 3,000 feet above the sea, the general declivity of the land being from west to east. This portion of India is governed by the two presidencies of Bombay and Madras, their armies being distributed over the whole of the Dekhan, and branching out into some of the adjoining or recently conquered provinces: thus, the Bombay presidency has its troops in Guzerat, Cutch and Sind on the north-west of the peninsula, and the Madras troops hold British Burmah, Penang, Malacca, Singapore, Hong-Kong and sometimes Aden.

Gold is found on the Neilgherry Hills in the numerous streams of the Malabar Collectorate, in the Dharwar, Bellary, Cuddapah and Madura Collectorates, in Mysore in the Northern Circars and is everywhere washed for valuable gems; diamond, corundum, spinel ruby, garnet, topaz, tourmaline, beryl and quartz are often found along with gold, but are often thrown aside by the gold-washers from an unacquaintance with their appearance in a natural state.

India, south of the Vindhya range and of the Nerbudda river is termed the peninsula, by the British, but the hindoos and mahomedans call it the Dekhan or South. At its broadest part, in the twenty-second degree of north latitude, it is twelve hundred miles across, but it tapers away towards the south and in latitude 7° 40' north, ends in the Promontory of Cape Comorin the Indian ocean washing its western and the Bay of Bengal its eastern shores. A range of mountains runs along each side of this peninsula, parallel with the coast, leaving between them and the sea in their whole length from north to south, a belt of low level land from twenty to fifty miles in breadth. These two mountain ranges are termed the eastern ghauts, and the Syhadri mountains or western ghauts and have an average elevation of 1,200 to 3,000 feet respectively, but solitary mountains and spurs from the western range attain an eleva-

tion of 6,000 and 8,000 feet above the level of sea. The western ghauts, on the side next the sea, are scarped and at places sink precipitously 2,000 feet to the level belt below. The eastern ghauts do not fall so abruptly, but both ranges are covered with thick impenetrable forests through which a few passes lead from the coast into the interior of the country which is upraised by the ghauts, into table-lands from 1,200 to 3,000 feet above the sea, the general declivity of the land being from west to east. This portion of India is divided into the two presidencies of Bombay and Madras, their armies being distributed over the whole of the Dekhan, and branching out into some of the adjoining or recently conquered provinces; thus the Bombay presidency has its troops in Guzerat, Cutch and Sind on the north-west of the peninsula, and the Madras troops hold British Burmah. The central outburst of granite rocks in the peninsula is traced from north of the Godavery, through Hyderabad, the Ceded Districts and Mysore to Ceylon. This rock and greenstone form the prominent features of the Dekhan, clay-slate, mica, chlorite and hornblende schists, sandstones and limestones with fossils of a postoolite age being the stratified rocks through which they burst. The greenstone is supposed by some observers to decompose into a deep black earth, light when dry, and cracked and rent by the sun in the hot season, but forming a tough, deep, tenacious soil in the rains, rendering marching almost, if not wholly impracticable. It is called "regur" in the Dekhan, and is the "cotton soil" of Europeans, by many of whom it is regarded as indicating an unhealthy locality. The granite rocks, on the other hand, decompose into a red sandy soil, which is generally hard, and as it allows a rapid percolation of water and quickly dries, it is less fertile, but is considered more favourable to health. It may be doubted, however, if there be any facts to prove that the one soil is more favourable to health than the other.

The Tamil-speaking inhabitants of the Coromandel coast can make themselves intelligible when they get into the districts on the western coast of the peninsula, where Malayalim is vernacular.

In the extreme south, in which the Tamil language prevails, there were the following ancient kingdoms.

The Chola, was an ancient dynasty of the south of the peninsula of India, regarding whom little has come down to the present day. The several capitals of the Chola were at Conjeveram, Woriur, Combaconum, Gangondaram, Tanjore. But the whole history of this, the most important power in the peninsula, is involved in great obscurity. We have no authentic information that can be trusted, anterior to the 9th century.

Canarese.—The people who speak Canarese are about five millions in number, chiefly in the centre of the peninsula; they are a tall and singularly graceful race with whom, as amongst the Kandians in Ceylon, a community something akin to polyandry is very prevalent. In this they somewhat resemble the Coorg race and the Nair of Travancore.

The Malayalin language is spoken in the south-west of the peninsula by about 2½ millions, and the Tulu, on the sea-board somewhat to the north, by about 100,000 or 150,000.

Sir Erskine Perry and the Reverend Dr. Caldwell remark that the brahmins made a simple classification of the languages of India depending mainly on geographical considerations, by which five northern languages are grouped in one class and five southern ones in another, under the denominations of panch Gaur and panch Dravid, the term Gaur or Bengal applying to all northern India, while Dravida, the name of that part of the Coromandel coast lying between the twelfth and thirteenth parallels of north latitude, is applied to the whole peninsula. Their classification was as under:

The five Gaur.	The five Dravid.
1. Saraswati (extinct)	1. Tamil
2. Kanoji	2. Marathi
3. Gaur or Bengali	3. Carnatika
4. Mathala or Tirhuti	4. Telinga or Telugu
5. Orissa or Urya.	5. Gujerati.

In the Peninsular are the following wild tribes—

* Khond in Orissa.

Saura between the Khond boundaries and Purla Kimediy.

Chenchuar between the rivers Kistnah and Pennar.

Yenedi on the Pulicat lake.

Baidera in Bellary and Zoraporo.

Pulliar in Tanjore.

Marawar at Rannad and Tinnevely.

Kollari in Poodicotta.

Chemnuar? in Cochlin.

Nendi? in Travancore.

Holier in Canara.

Toda, Badagha, Kohtar, Erular, Kurumbar on the Neilgherries.

According to Mr. Logan, the oldest races of India, Ultra India and Asianesia, were of a variable African type, the two principal forms being Australo-Tamulian or quasi Semitic and Negrito, followed in Asianesia by the Malagasi. He is of opinion, that the present prevalent Ultra Indian races entered the region from the north-east and at a very remote period spread on the one side over Ultra India and the basins of the Brahmaputra and Ganges, and partly into southern India; and on the other were diffused by a long succession of movements all over Asianesia. Throughout these regions, they came in contact with more ancient races, and have in some places variously blended with them and in some dis-

lodged or exterminated them, while in others, the old tribes have been able to maintain a certain degree of independence and purity. In southern India, the ancient element was preserved in some degree, owing apparently to a civilization early received from partially allied Semitico-African and Semitic nations, in the Andamans, the interior of the great Nicobar, the jungles of the Malay Peninsula, and in the basins of the Salwin, Irawadi and Kolandan all which appertain also to the eastern region.—*Newbold's British Settlements*, Vol. i, p. 424.

PENINSULAR and Oriental steam navigation company, a great company of carriers, plying with steam-ships ranging up to 2,653 tons between Great Britain and the entire east. In 1868 they had 48 ocean steamers with an aggregate tonnage of 85,632 and 18,620 horse power. In the year 1859, this mammoth company had possessed, 57 steamers and 9 hulks, manned by 18,000 seamen, in their various lines as under:—

Line.	No. of ships.	Tonnage.	Horse power.
Southampton and Alexandria. ...		1165 to 2622	350 to 450
Peninsular ...		782 „ 1650	200 „ 550

PENNAR, (N.) Rises in the Nundidroog

table-land, lat. 13° 23', long. 77° 43' runs N. W. 30 m. N., 95 m.; E. 230 m. into Bay of Bengal. Length 355 m. It receives the Chittravutti, 107; Paupugnee, 130; Chittair, 75 m. The Pennar is comparatively a small stream, but of much geological interest, the greater part of its waters being derived from the districts in which the diamond sandstones and the argillaceous limestones, on which they rest, are exhibited in their most characteristic forms, and where they are most easily investigated. Like all the rivers of southern India, granite is frequently seen in the bed of the Pennar, more especially in its southern branches, where the passes of Ryachottee lead to the granitic table-land of Mysore, having an elevation of 3,000 feet above the sea, or 2,500 above Cuddapah, the principal town of the Pennar basin. The Nulka Mulla hills, extending from the Mysore frontier to the basins of the Kistnah and Godavery, and the minor ranges dependent on them, and having the same composition and direction, are crossed at right angles by the Pennar, which makes its way through them, like the Kistnah, by traversing narrow gorges with perpendicular sides. The plains at the base of the table-land of Banganapilly consist of a rich black alluvium, containing fragments of basalt, jasper, and the various minerals found in the hills. It rests on a fine, compact, dark blue or nearly black limestone, which contains much argillaceous and siliceous matter. This limestone abounds with springs, and is in some places so cavernous as to afford passage to subterranean streams. Basalt protrudes in a few places near Banganapilly. On ascending the hill, the limestone becomes more schistose, and is of a paler colour, gradually approaching in its structure and composition to clay slate, but it is far more friable. On the schist a more or less compact sandstone rests, varying very much in colour, composition, and appearance in different places. Above Banganapilly it contains the diamond breccia described by Voysey. The breccia is not an interstratified rock, but an intermixture of the common sandstone, in different parts of the same stratum, with larger fragments of older rocks, generally rounded but sometimes angular. On emerging from the gorge in the Nalla Mulla range the Pennar enters the plains of the Carnatic, and near its mouth flows through low hills of laterite. This deposit rests on the ordinary granite of the Carnatic, with its associated syenites, hornblende schist, quartz rock, and mica slate. It is in a rock composed of a mixture of the last two minerals that the copper ores of the Nellore district are situated. The ores are of various kinds, but the richest is a silicate, containing, according to Mr. Prinsep, 90 per cent. of the pure metal, copper

also occurs. If this belongs to the "argillaceous limestone" formation, the fact will be of use in determining the relations of that rock to the gneiss, talc slate, and mica schist; a subject on which no observations of any value have yet been made. The primary rocks of this district contain magnetic iron ore and corundum, both of which occur in the diamond sandstone.—*Carter's Geological Papers on Western India*, p. 8.

PENNAH, (S.) Rises in the N. Nundidroog table-land, lat. 13° 32', long. 77° 45' runs S. to Mootanhalli, 55 m., S. E., 190 m., into Bay of Bengal, a mile N. of Fort St. David. Length 245 m. Gold is found in its sands, in its passage through the Carnatic.

In common speech, there are several peppers, black pepper ; white pepper ; long pepper ; melegueta pepper ; cayenne pepper or chili pepper ; guinea pepper ; jamaica pepper and cubeb pepper, the last used as a medicine, the others in food as condiments. The black pepper of commerce is obtained from the dried unripe fruit (drupes) of *Piper nigrum*, a climbing plant common in the East Indies, and

of the simplest culture, being multiplied with facility by cuttings or suckers. The ripe fruit, when deprived of its outer fleshy covering by washing, forms the white pepper of the shops. The dried fruiting spikes of *P. longum*, a perennial shrub, native of Malabar and Bengal, constitute long pepper. According to Dr. Roxburgh, *P. trioicum* is cultivated in the East, and yields an excellent pepper. Pepper is a regular crop on the Western Coast of India in Coorg, Mysore, Canara and Travancore. White pepper is less pungent than the black. The quantity of black pepper exported is immense, that of Malabar is the best.

Piper nigrum or black pepper and *Piper longum* more recently named *Chavica Roxburghii* or long pepper, are chiefly used for dietetic and culinary purposes, *Piper cubeba* and *Artanthe elongata* or the matico plum are principally employed in medicine. The plant which yields cayenne, *Capsicum annuum*, often improperly termed cayenne pepper, does not belong to the family of *Piperaceæ* at all but to that of *Solanaceæ*. The pepper of commerce is furnished by *Piper nigrum*, the black pepper plant which grows both in the East and West Indies, in Sumatra, Java and other islands, it is a shrubby, climbing plant, which attains the height of from eight to twenty feet. The berries, or peppercorns, grow on terminal flower-stalks or spadices. They are at first green, but change subsequently to red and then to black. When any of the berries on a spadix have begun to turn red, the whole are gathered, dried in the sun, and the stalks separated by the hand. In drying, the succulent part of each berry becomes contracted and wrinkled, forming a hardened wrinkled cortex, the corrugations being much raised, and describing a kind of elevated network. It climbs to the height of twenty feet but is said to bear best when restrained to the height of twelve feet. It begins to produce at about the third year, and is in perfection at the seventh; continues in this state for three or four years, and declines for about as many more, until it ceases to be worth keeping. The fruit grows abundantly from all its branches, in long, small clusters of from twenty to fifty grains. When ripe it is of a bright red colour. After being gathered it is spread on mats in the sun, when it loses its red colour and becomes black and shrivelled as we see it. The grains are separated from the stalks by hand-rubbing. That which has been gathered at the proper period shrivels the best but if plucked too soon, it will become broken and dusty in its removal from place to place. The vine produces two crops in the year but the seasons are subject to great irregularities. Those berries are the best which are not too small nor too much corrugated,

which are heavy and sink readily in water. In a section of the black berry, two parts are to be distinguished an outer and an inner, the first is black or reddish black; and the second more or less white, hard and brittle, except in the centre of the seed where it is frequently soft and pulverulent. The active properties of black pepper depend upon an acrid resin, a volatile oil, and a crystallisable substance called piperine, which exists also in long pepper, and in cubebs. The resin is situated chiefly in the outer part of the cortex, the volatile oil in the inner part or fourth layer, and the piperine in the yellow cells of the seed itself. Pepper is liable to adulteration, linseed, mustard-seed, wheat-flour, pea-flour and ground rice.

The pepper vine rises about two feet in the first year of its growth, and attains to nearly six feet in the second, at which time, if vigorous and healthy, the petals begin to form the corolla or blossom. All suckers and side shoots should be carefully removed, and the vines should be thinned or pruned, if they become bushy at the top. Rank coarse weeds and parasitical plants should be uprooted. After being gathered, the fruit is spread on mats in the sun to dry, when it becomes black and shrivelled. The grains are separated from the stalks by hand rubbing. The roots and thickest parts of the stems when cut into small pieces and dried, form a considerable article of commerce all over India, under the name of *Pippula-moola*.

In a very good soil, a pepper vine will yield about one-eighth of a pound of dry produce at the end of the first year; at the end of the second, about a quarter of a pound; and at the expiration of the third, probably one pound; at the end of the fourth, from three to three-and-half pounds; ditto fifth, from eight to ten pounds. After the fifth year up to the fifteenth, or even the twentieth year, about ten pounds of dry merchantable produce may be obtained from each vine, under favourable circumstances. A pepper plantation never survives the thirtieth year, unless in extremely rich soil, and then it is unproductive; nor will the young vine thrive on an old worn out pepper land, a peculiarity which is applicable to the coffee tree. The chief crop lasts from August to February. Four pounds of dry produce, for ten of green, is considered a fair estimate. Great care is requisite in the management of the vine, and especially in training and tying it up on the props. It is subject to be injured by the attacks of a small insect. The green pepper dries in two or three days, and if it is intended that it shall be black, it is pulled before it is quite ripe. To make white pepper, the berry is allowed to remain somewhat longer on the

wine; when plucked, it is immersed in boiling water, by means of which process and subsequent friction, before drying, the husk is separated. Three kinds of black pepper are distinguished by wholesale dealers. "Malabar pepper, the most valuable, is brownish-black, free from stalks and nearly free from dust is Penang pepper, brownish-black larger, smoother, free from stalks, but very dusty. It is sometimes used in England to manufacture white pepper. Sumatra pepper, the cheapest sort, is black mixed with stalks and contains much dust. Under the name of Sumatra pepper, some dealers include the Penang or brownish-black sort, and the black Sumatra sort. Three kinds of varieties of white pepper have also been distinguished. Tellicherry pepper, which is of two kinds: large fine Tellicherry pepper is larger and whiter than any other description of white pepper, and fetches a higher price; small or coriander-like pepper is shrivelled. Common white pepper comes from Penang by Singapore, it is round, and not shrivelled, its value depends on its size and whiteness. English bleached or white pepper, when the two preceding sorts are scarce, brown, Penang pepper is bleached. The yellowest and largest are chosen for this purpose for neither an expensive nor small sort would pay. Almost all the plants of the family Piperaceæ, have a strong aromatic smell and a sharp burning taste. This small group of plants is confined to the hottest regions of the globe; being most abundant in tropical America and in the East Indian Archipelago, but more so in the equinoctial regions of Africa. The common black pepper, *P. nigrum*, represents the usual property of the order, which is not confined to the fruit, but pervades, more or less, the whole plant. It is peculiar to the torrid zone of Asia, and appears to be indigenous to the coast of Malabar, where it has been found in a wild state. From this it extends between the meridians of longitude 96 degs. and 116 degs S., and the parallels of latitude 5 degs. S. and 12 degs. N., beyond which no pepper is found. Within these limits are the islands of Sumatra and Borneo, with the Malay peninsula and part of Siam. Sumatra produces by far the greatest quantity of pepper. In 1842, the annual produce of this island was reckoned at 30,000,000 lbs., being more than the amount furnished by all the other pepper districts in the world. A little pepper is grown in the Mauritius and the West India islands, and its cultivation is making some progress on the western coast of Africa, as England imported from thence 2,909 bags and casks in 1846, and about 110,000 lbs. in 1847. Mr. J. Crawford, F. R. S., recently estimated the produce of pepper at lbs. 50,000,000, as follows:—

Sumatra (West Coast) ..	lbs. 20,000,000
„ (East Coast) ..	8,000,000
Islands in the Straits of Malacca ..	3,600,000
Malay Peninsula	3,733,333
Borneo	2,666,667
Siam	8,000,000
Malabar	4,060,000

If we add to this,
 Western Coast of Africa & B. W. Indies 53,000
 Java 4,000,000
 Mauritius and Ceylon 80,000
 It gives 54,133,000 as the total produce of the world.

Black pepper constitutes a great and valuable article of export from the Archipelago. In the first intercourse of the Dutch and English with India, it constituted the most considerable and important staple of their commerce. The production of pepper is confined in a great measure to the western countries of the Eastern Archipelago, and among these to the islands in the centre and to the northern quarter, including the Malay Peninsula. It is obtained in the ports on both sides of the coast of the latter, but particularly the north-eastern coast. The principal quarters, according to Mr. Crawford, are Patani, Tringanu and Kalantin. In the Straits, a large quantity is produced in the island of Singapore, and above all in Pinang, where the capital of Europeans and the skill and industry of the Chinese have been successfully applied to its culture. The western extremity of Sumatra, and the north-west coast of that island, are the most remarkable situations in it for the production of pepper, and here we have Achcen, Tikao, Bencoolen, Padang, and the country of the Lampungs. The production of the eastern extremity of Sumatra or Palembang is considerable, but held of inferior quality. In the fertile island of Java, the quantity of pepper grown is inconsiderable, nor is it remarkable for the goodness of its quality. The province of Bantam has always furnished, and still continues to produce, the most pepper; but the culture of this creeper is fast giving place in Java to staples affording higher profits and requiring less care. The exports were in the following years—

1830 .. piculs 6,061	1843 .. lbs. 3,737,732
1835 11,868	1848 461,680
1839 11,044	1851 95,637
1841 13,477	1852 135,690

The number of pepper vines in the district of Bencoolen, in the close of the year 1852, was as follows:—1,571,894 young vines; 2,437,052 bearing ditto; total, 4,068,946. Up to the end of September there had been delivered to the government 1,145 piculs white pepper, and 1,128 piculs black pepper, while of the harvest of 1852 there were still probably to be received 330 piculs white, and 4,967

piculs black pepper. The south, the west, and the north coasts of the great island of Borneo produce a large quantity of pepper; as early as 1721 it was a staple commodity of this island. Banjarmassin is the most productive place on the south coast, and the State of Borneo proper on the north coast. The best pepper certainly does not grow in the richest soils, for the peppers of Java and Palembang are the worst of the Archipelago, and that of Pinang and the west coast of Sumatra are the best. Care in culture and curing improves the quality, as with other articles, and for this reason chiefly it is that the pepper of Pinang is more in esteem than that of any other portion of the Archipelago. From the ports and districts of Siam 3,500 to 4,000 tons are exported annually. The duty in 1851 levied on pepper in England was 6*d.* per lb., while the wholesale price for that of Pinang, Malabar, and Sumatra is about 4*d.* per lb. White pepper ranges from 9*d.* to 1*s.* 6*d.* per lb. The prime coast in Singapore is not more than 1½*d.* per lb. About 70,000 or 80,000 piculs of pepper are annually exported from Singapore. More than one-half of the pepper exported from Singapore is grown in the island by Chinese settlers. A reduction in the duty on pepper has always been followed by a very large increase in the consumption of the article, as will appear from the following table, showing the importation and consumption in Great Britain during some of the first and last years of the different rates of duty:—

Year.	Quantity consumed	Duty Singapore price.			
		<i>d.</i>	<i>d.</i>	<i>s.</i>	
1811	...lbs. 1,457,383	10½	0	7½	to 0
1814	941,569	10½	0	11	1
1820	1,404,021	6	0	6½	0
1824	1,447,030	6	0	4½	0
1826	2,539,027	0	0	4	0
1836	2,749,491	0	0	0	0
1837	2,625,075	6	0	0	0
1845	3,210,415	6	0	2½	0 4½

An acre of pepper vines will yield 1,161 lbs. of clean pepper. In Sumatra a full-grown plant has been known to produce seven pounds; in Pinang the yield is much more. The average produce of one thousand vines is said, however, to be only about 450 lbs.

Pliny states that the price of pepper in the market of Rome in his time was, in English money, 9*s.* 4*d.* a pound. The pepper alluded to must have been the produce of Malabar, the nearest part of India to Europe that produced the article, and its prime cost could not have exceeded the present one, or about 2*d.* a pound. After the great discovery of Vasco de Gama, the price of pepper fell to about 1*s.* 3*d.* a pound, a fall of 8*s.* 1*d.* from that of the time of Pliny, and of 4*s.* 9*d.* from that of the mahommedan Arabs, Turks and Venetians.

The imports into Great Britain were:

	Imports.	Home consumption.
1826.....	lbs. 14,000,000	7,500,000
1841.....	15,000,000	9,500,000
1845.....	9,852,084	3,209,718
1846.....	5,906,586	3,299,955
1847.....	4,669,930	2,966,022
1848.....	8,125,545	3,185,337
1849.....	4,706,042	3,257,911
1850.....	8,028,319	3,170,883
1851.....	3,996,496	3,303,403
1852.....	6,641,699	3,524,501

The following return shows the number of bags of pepper imported into the United Kingdom, with the quantity retained for home consumption:—

	Imports.		Retained for home consumption.	
	Black. bags.	White. bags.	Black. bags.	White. bags.
1843.....	37,840	3,861	21,163	2,257

1848.....	65,518	3,042	31,665	2,950
1849.....	43,651	2,616	32,246	3,859

Ethiopian pepper. The fruit of *Xylopia aromatica* is commonly called Ethiopian pepper, from being used as pepper in Africa. The seeds of some species of fennel-flowers (*Nigella sativa* and *arvensis*), natives of the south of Europe, were formerly used instead of pepper, and are said to be still extensively employed in adulterating it. In Japan, the capsules of *Xanthoxylum piperitum*, or *Fagara piperita*, are used as a substitute for pepper, and so is the fruit of *Tasmania aromatica* in Van Diemen's Land.

Black Pepper.

Hu-tsalin,	CHIN.	Lada, Lada-itam, MALAY.
Kala-mirch,	HIND.	Maricha, "

White Pepper.

Safed mirch,	HIND.	Lada putih, MALAY.
--------------	-------	--------------------

Black pepper and white pepper are the fruit of the *Piper nigrum* the former being the dried fruit, while the white pepper is the ripe berry deprived of its skin by soaking it in water, rubbing it off and drying it in the sun. This has less of the peculiar virtues of the spice than black pepper, and is not so generally used. Pepper is a warm carminative stimulant; it is used largely in Europe but in the south and east of Asia, the capsicum, Chili or Cayenne spice is preferred. It strengthens the stomach, gives tone to the system, and assists digestion. In the Northern Circars, of the Madras Presidency, the *Piper trioecum*, an excessively pungent pepper, is largely used as a substitute for black pepper, and in America, the plants *Peltobryon longifolium*, *Serronia jaborandi*, are similarly used, also, at the Cape, *Cocobryon capense*, and *Chavica Roxburghii*, the long pepper of commerce, is used similarly all over the world.

There are two modes of cultivating pepper, on the Western coast of India. In Calicut, it is in gardens; but in other parts of

Malabar, it is grown in large fields. The jack, mango, cashewnut or other trees with a rough bark, are planted in rows, and when they have attained the height of 15 or 20 feet, the pepper is planted at their bases and sown thickly, it covers the stem and festoons over the branches. The pepper cuttings or suckers are put down by the commencement of the rains in June and in 5 years the vine begins to bear. Each vine bears 500 to 700 bunches, which yield about 8 or 10 seers when dried. During its growth, it is necessary to remove all suckers and the vine is pruned, thinned and kept clean of weeds. The vine bears for 30 years, but every 10 years the old stem is cut down and layers are trained.

Pepper is grown largely both at Singapore and Pinang and propagated chiefly by slips. When the slips have been some months planted and have attained three or four feet in height, their tendrils are detached from the props, and the whole plant bent down and buried a few inches below the surface of the ground. In a short time, the buried vine sends up a number of shoots and the strongest of these are selected and carefully trained up the props; small pickings are obtainable for the first three years, but in its fourth year it attains maturity, and yields its full return, probably 3 or 4 lbs. weight. The berries which are about the size of a pea grow in clusters like currants. For the black pepper, the berries are gathered while green, about a month before they would ripen. They are first exposed to the sun which causes the soft outer skin to dry up round the little seeds inside, giving the rough shrivelled appearance which the marketable article possesses. They are next conveyed to a shed, and placed in a series of sieves over a slow wood fire.

To prepare white pepper, the berries are allowed to ripen and become of a beautiful bright red colour; the outer or fruity skin becomes tender and soft and is of a sweetish taste. When plucked the berries are collected in loosely woven bags and steeped for a day or two in water, either hot or cold. This serves to loosen and detach the red pulpy seed covering, and when taken out and dried in the sun, a little hand-friction is all that is required to clear the seeds. They are then winnowed and thus made ready for the market.

The black pepper vine is indigenous to the forests of Malabar and Travancore, and for centuries has been an article of exportation to European countries from that coast. Although growing in other countries of the east, Malabar pepper is considered to be the best. Its cultivation is very simple, and is effected by cuttings or suckers put down before the commencement of the rains in June. The soil should be rich, but if too much moisture

be allowed to accumulate near the roots, the young plants are apt to rot. In three years the vine begins to bear. They are planted chiefly in hilly districts, but thrive well enough in the low country in the moist climate of Malabar. They are usually planted at the base of trees which have rough or prickly bark, such as the jack, the erythrina, cashewnut, mango tree and others of similar description. They will climb about 20 or 30 feet, but are purposely kept lower than that. During their growth it is requisite to remove all suckers, and the vine should be pruned, thinned and kept clear of weeds. After the berries have been gathered they are dried on mats in the sun, turning from red to black. They must be plucked before quite ripe, and if too early they will spoil. White pepper is the same fruit freed from its outer skin, the ripe berries being macerated in water for the purpose. In this latter state they are smaller, of a greyish white colour, and have a less aromatic or pungent taste. The pepper vine is very common in the hilly districts of Travancore, especially in Cotayam, Meenachel and Chenganacherry districts, where, at an average calculation, about 5,000 candies are produced annually.

Long pepper the *Chavica roxburghii*, is another cultivated species. It is readily propagated by cuttings. The stems are annual, and the roots live for several years, and when cultivated, usually yield three or four crops, after which they seem to become exhausted, and require to be renewed by fresh planting. The berries of this kind of pepper are lodged in a pulpy matter like those of *P. nigrum*. They are first green, becoming red when ripe. Being hotter when unripe, they are then gathered and dried in the sun, when they change to a dark-grey colour. The spikes are imported entire. The taste of the berries is pungent though rather faint. For further information on the vegetable products of Malabar, see Drury's useful plants of India.—Cameron; Simmonds; Markham, pp. 452-53.

Cayenne Pepper.

Capsicum,	ENG.	Lal-mirch,	HIND.
Chili pepper,	"	Lada-merah,	MALAY.
Cayenne,	"	Chabai,	"
Red pepper,	"	Chabai lombok,	"

Capsicum is the powdered pods of the *Capsicum annum*, has a bitter acrid, pungent taste. In British India and in China, it takes the place of the black pepper in the estimation of the people. The several species of capsicum are natives of South America, whence they have been introduced into the Old World, and become universally diffused, from the fondness of Asiatics for warm condiments. Chili, either simply or in composition, is the Mexican name for all the varieties and species of this genus, but many varieties have no doubt been raised to the rank of

species. The fruit varies much in form, being round, oblong, cordate, or horned, and either scarlet or yellow, and more or less pungent in taste. The horn-shaped variety is most common, from 2 to 3 inches in length, and from $\frac{1}{2}$ to 1 inch diameter at the base, and usually called Capsicums, and the plant *C. annuum*. One variety, called Cockspur pepper, has the fruit long and slender. Sometimes the fruit is globose or lobed; the variety is then called *C. baccatum*. When the fruit is small, elongated and pointed, the variety is called Bird-pepper, and botanically *C. minimum*. When the plants are allowed to grow beyond the year, they become shrubby, and form the variety called *C. frutescens*. The berry or fruit of the capsicum, in its dried state, when powdered, forms Cayenne pepper, but are often preserved in vinegar as a pickle, and the fluid likewise employed under the name of Chili vinegar. The fresh capsicums used in Europe are principally obtained from the *Capsicum annuum*, a weedy plant found wild in South America and the West Indies, but grown largely in Southern Asia. It grows from one to two feet high, forming a dark-green bush, with ovate or ovate-lanceolate leaves; its flowers are small and white; its fruit is extremely variable in size, colour, position and even in quality.

The large red bullock's heart and yellow tomato capsicums are mild enough to be sliced with salad. A much hotter species is the *C. fruticosum*, or *frutescens*, or goat-pepper, of the East Indies, which differs from the *C. annuum* in being a shrub and in its fruit being very small. There is also a kind cultivated by the Chinese, with black fruit.

Jamaica pepper, or All-spice, or Pimento is the fruit of *Eugenia pimento*, a native of the Caribbee islands, but now cultivated in the East Indies. The berries are gathered before ripening, and are dried for seven days, by exposure to the sun, during which they lose their green colour and become of a reddish brown. Their taste is warm, aromatic, pungent, and slightly astringent, and with the oil which they yield, called Pimento oil, they are used in domestic economy.

This pepper is the produce of a perennial plant a native of Bengal, Siam, &c. The fruit is hottest in its immature state and is therefore ga-

thered whilst green, and dried in the sun. It is met with in entire spikes about an inch long, possessing a darkish brown, or grey colour. It has a weak aromatic odour, an intensely fiery, and pungent taste, and its properties correspond closely with those of black pepper.

The root of the long-pepper is a favourite medicine of the hindoes; it possess the virtues of the berry, but in a weaker degree, and is prescribed by them in cases of palsy, tetanus, and apoplexy. The long pepper is produced in abundance in many parts of Upper, as well as Lower Hindoostan. Pepper root is procurable in most Indian bazaars.—*Ainslie.*

PEPPER, WILD. Filfil burree, the fruits of several species of *Vitex*.—*Ben. Ph., p. 30.*

PEPPER-WORT, Eng. *Xanthoxylon alatum*, *Roxb.*

PEPUDEL, TAM. *Tricosanthes cucumerina*, *Linn.*

PEPULOR Aswath, HIND. The Indian aspen leaf, *Ficus religiosa*; its tremulous motion is owing to its long leaf stalk, which is twisted by the weight of the leaf when acted on by the wind. It is sacred to the god Vishnu, who was born under its branches, hence the cutting of it is accounted an unpardonable sin, not to be atoned for even by sacrifice; fortunately the wood is useless, so there is little temptation. The buddhists regard it as their holiest tree, and say that the egg-shaped leaves, suddenly tapering to a point, always tremble out of respect to Gotama, who sat under its branches. On the fleshy part of the leaf being removed, and the skeleton varnished, most beautiful

drawings of insects, birds and flowers, are made by the Chinese. In Kandy, the form of its leaves was allowed to be painted only on furniture employed exclusively for the king's use. Bird-lime is made from the juice of the stem; the leaves of this, as well as of the castor oil plant, are given for feeding silk-producing worms. The lac insect delights on its twigs. The fruit comes out on the branches. Its Sanscrit names are chaladala, quivering branches—peppala, the preserver—kungarasan, elephant's food—ashvatter, not durable. The trunk, when old, has many ridges and hollows, as if many trunks were united: the bark is deemed a good tonic.

PERA, HIND. A kind of sweetmeat, made in round cakes.

PERAH or Perach river, on the Malay coast 8 miles east of the Sambilangs, is said to extend 150 miles inland.

PERAK, HIND. A head ornament, worn by married women in Spiti, Ladakh.

PERAK, MALAY. Silver.

PERAK. Lieut. Newbold, from the several opportunities he had of seeing the Binua race observed that their general physical appearance, their lineaments, their nomadic habits and a few similarities in customs, point to a Tartar extraction. Sir S. Raffles, says that Jäva was originally peopled by emigrants coming in vessels from the Red Sea; from whence it is inferred that these ancient Egyptians might have been the ancestors of the people at present called Binua. The Jakun occupy the south part of the Malay peninsula. Under that name are comprised all the various tribes, known under the terms of Orang utan, Orang bukit, Orang sungie, Orang laut, Rayat, Sakkye, Halas, Balandas, Besisik, Akkye, etc., different names which denote not several kinds of men, but only point out the places where they are found, or their way of living. Sir S. Raffles' opinion was that the people of the Archipelago and peninsula were of a Tartar stock but there is a remarkable difference in the physical appearance of the several classes of Jakun. Those of Malacca are generally as tall as the common run of Europeans; they are more dark than any other of the wild tribes.

The Jakun of Johore are a fine race of men; many of them are taller than those of Malacca; the face also expressive and well characterized, and the expression of the eyes in many of them is a little severe. The

Jakun of the Menangkabau States, are very short, their physiognomy is low, and seems to announce great simplicity; many of them are ugly and badly made indicating a degenerated race. The constitution of the Jakun is generally strong, the hair is black, ordinarily frizzled, but very different from the crisp hair of the Caffree. Some of them leave the whole to grow, and turn it round the head, as the Cochin Chinese, others, as many of those of Malacca, cut their's entirely; others, chiefly of the Menangkabau states and of Johore, shave the head, leaving it only at the crown above three inches in diameter where they never cut it, the same as the Chinese; and to prevent this head of hair from being hooked by the branches of trees in their sylvan habitations, they tie it up in the form of a top knot. They have scarcely any beard, and many of them have none at all. The women leave their hair to grow, and then tie it up in the same way as the Malay women; but as they have but little occasion to care much for appearance, it will be easily imagined that they are not very particular in this respect. It has been said that in the forests of Pahang are found numerous tribes of Jakuns, who are nearly as white as Europeans, small, but very good looking; and the Malays catch and take them to Pahang or to Siam, where on account of their whiteness and comeliness they sell them very dear. The Jakuns of Malacca, are the least in number, and cannot be more than three hundred, about one-half of whom are near Reim and Ayet panas, at Ayerb aru, Gassim, Kom-mender, Bukit singhi, the river of Muar near Pankalangkota, at Poghalay, Sagil, Segamon, Lemon, Jawee, the small river of Pago, and that of Ring. The remainder are to be found, at Bukitmore, Ayer trass, Bukit gadong, Tanka, and it is reported there are a good number at Segamet. The Jakuns of Johore inhabit that part of the peninsula which is under the sway of the sultan of Johore, cannot amount to more than one thousand, scattered over that large extent of country. The author omits the Binua of those portions of the Simrong and other branches of the Indian which are in Johore. The southern part of Pahang is inhabited by the same tribe of Binua who are found in Johore. The Jakuns of Johore build houses in the Malay way, some of which are fine buildings, more comfortable than any Malay house in the interior of Johore: all raised about six feet from the ground, and entered by a ladder like the Malay houses, others are as described by Lieutenant Newbold rude edifices on the top of four high wooden poles: thus elevated for fear of tigers, and entered by means of a long ladder. The roofs are often thatched with Chucho

leaves. There is but one room, in which the whole family is huddled together with dogs and the bodies of the animals they catch. The huts are so made as to be moveable at a moment's warning; they are ordinarily situated on the steep side of some forest-clad hill, or in some sequestered dale, remote from any frequented road or foot-path, and with little plantations of yams, plantains and maize; some have also fields of rice about them. The bones and hair of the animals upon, whose flesh the inmates of these scattered dwellings feed, strew the ground near them, while numbers of dogs generally of a light brown colour give timely notice of the approach of strangers. The Jakuns of Malacca characterised as the most ignorant, are also the poorest and most miserable, their best houses are about the same as the worst of those of the Menangkabaus, and families live without any house. Five or six families, choose a place in the thickest of the forest, and clear a circle of about thirty feet in diameter; which they surround with the branches of the trees they have just cut; to this they join other thorny branches collected from other parts, and so make a sort of bulwark against tigers, bears and panthers, which are there in good number. Having done this they proceed to establish their dwelling in this enclosure, in the following way, each family works to construct what will serve for a bed during the night, a seat in the day time, a table for the repast, and a dwelling or shelter in bad weather. It consists of about fifteen or twenty sticks of six feet long, laid one beside the other, supported at the two extremities by two other transverse sticks which are set upon four wooden posts; the whole being about two feet in height, four feet broad and six feet long. One dozen Chucho leaves gathered by their ends, tied at the head of the bed, extend themselves and cover it until the other extremity; these beds are placed around the enclosure, in such a way that when all the persons are sleeping every one has his feet towards the centre of the habitation which is left vacant, to be used as a cook room, or for any other purpose.

The clothing of the Jakuns (when they use any) is ordinarily the same as those used by the Malays, but poor, miserable, and above all very unclean; many of them use cloths without washing, from the day they receive or buy them, until they become rotten by use and dirt; and they are obliged to throw them away. If some vermin are found, which is often the case, principally upon the women who are more dressed, they are immediately eaten with delight as in Cochin-China. If many of them are badly dressed, and some

nearly naked, it is more from a want of clothes than in accordance to their own wishes for the most agreeable presents which can be offered to them are some trowsers, sarongs, bajus, or some handkerchiefs to put round their head, as is the Malay fashion, those of them who go habitually nearly naked, do not appear so before strangers excepting they have no clothes. The Jakuns of Johore, who are superior to the others in many respects, are also the best dressed, their women are much the same as Malay women as to dress, and the order of their appearance; having also great numbers of rings on their fingers, some of which are crystal some of copper, and some of tin; but also a good many of silver; they take a peculiar pleasure in these ornaments, as well as in silver bracelets. The men have at least trowsers, small baju and a handkerchief for the head. The Jakuns of the Menangkabau states, have the same dress as that used by the Jakuns of Johore, and the women the same ornaments, but are not so well clothed; many of them go nearly naked, at least near their houses; and those who use clothes, show often an embarrassment which proves that they are not accustomed to their use. The Jakuns of Malacca are badly dressed, many of the women have only a sarong, and, if they are married, a ring, the necessary present of the husband before he marries them. The greater part of the men have nothing but a strip of the fibrous bark of the Terap tree, beaten into a sort of cloth of a reddish-brown colour, called a sabaring, round their loins; part of this comes down in front, is drawn between the legs and fastened behind. The Jakuns are not so lazy as either the Malays or hindoos. Their first and principal occupation is the chase; by which they feed themselves and their families. When there is no more food at home, the husband leaves home, beats the forest, and sometimes return with large pieces of venison, but sometimes with nothing; and on such days they go to sleep without supper. In the day time they remain at home where they prepare arrows and the weapons, the matter with which they poison their arrows, they cook and eat the animals caught the day before. They traverse the jungle all the day seeking after rattan, dammer, garu-wood, and several other articles of commerce; the next morning, sometimes with fowls they cook flesh before they eat it: but at other times they eat it raw: some merely put the animal upon the fire till the hair are singed, when they consider it as cooked. Some large monkeys after having been thus raw cooked, were dished up upon a mat as a meal to some seven or eight persons, who speedily devoured the whole in a few minutes, leaving only the skeleton. Some Jakuns refuse to eat

the flesh of elephants, under the pretext that it would occasion sickness: but many others are not so scrupulous.—*Hist. of Java, Vol. i, p. 62, 63, 2nd Edition; Journal of the Indian Archipelago, No. v, May 1848, Vol. ii, pp. 242 255-59, 260-61.* See India, Jakun, Quedah, Semang.

PERCA, the perch, a genus of fishes of the family Percidæ, as under:

FAM. 3.—Percidæ.

FIRST GROUP.—Percinæ.

3 *Perca*, 5 *Percichthys*, 2 *Paralabrax*, 8 *Labrax*, 2 *Lates*, 1 *Cnidon*, 2 *Psammoperca*, 1 *Percalabrax*, 3 *Acerina*, 1 *Percarina*, 6 *Lucioperca*, 2 *Pileoma*, 3 *Boleosoma*, 2 *Aspro*, 1 *Etelis*, 1 *Centropomus*, 1 *Nippon*, 1 *Enoplosus*.

SECOND GROUP.—Serranina.

1 *Aprion*, 1 *Apsilus*, 15 *Centropristis*, 1 *Callanthia*, 13 *Anthia*, 1 *Anyperodon*, 1 *Prionodes*, 135 *Sorranus*, 27 *Plectropoma*, 1 *Trachypoma*, 1 *Polyprion*, 1 *Pogonoperca*, 1 *Grammistes*, 3 *Rhypticus*, 1 *Aulacoccephalus*, 1 *Diploprion*, 1 *Myrionodon*, 19 *Genyorogus*, 45 *Mesopron*, 1 *Glaucosoma*.

THIRD GROUP.—Pentaceratina.

3 *Pentaceros*, 1 *Oreosoma*.

FOURTH GROUP.—Priacanthina.

15 *Priacanthus*.

FIFTH GROUP.—Apogonina.

19 *Ambassis*, 1 *Microichthys*, 58 *Apogon*, 9 *Apogonichthys*, 5 *Chilodipterus*, 1 *Scombrops*, 1 *Pomatomus*, 1 *Acropoma*.

SIXTH GROUP.—Grystina.

2 *Oligorus*, 1 *Grystes*, 3 *Aripis*, 1 *Huro*, 1 *Percilia*, 1 *Lembus*, 12 *Centrarchus*, 8 *Bryttus*, 1 *Pomotis*, 1 *Anoplus*, 1 *Odontoctes*, 11 *Dules*.

PERCA SCANDENS, *Dalldorf*. Syn. of *Anabas scandens*.

PERCHERS, a sub-division of birds, comprising 2 gen., 15 sp.

PERCIVAL, Caussin De, Author of an Essay on the History of the Arabs before mahomedanism, during the time of Mahomed, and until all the tribes became mahomedans, Paris 1847.

PERCOPSIDÆ, a family of fishes.

PERCY ILES, near Morton Bay, has a rasorial bird, the size of a fowl, which constructs

great mounds of earth, leaves, sticks, stones, and coral in which the eggs are deposited at a depth of several feet from the surface, and left there to be hatched by the heat of the fermenting mass of vegetable matter. In addition to these, are numbers of the pheasant-tailed pigeon, and the brush-turkey (*Talegalla lathamii*), the latter much esteemed for the goodness of its flesh.—*Macgillivray, Voyage, Vol. i, p. 62.*

PERDICINÆ, the partridge sub-family of birds, of the family of Phasianidæ as under:—

Fam.—Phasianidæ.

Sub-fam.—Pavoninæ, 2 gen., 4 sp. viz., *Pavo cristatus janicus*, *muticus*, 1 *Meleagris gallopavo*.

Sub-fam.—Polyplectoninæ, 5 gen., 10 sp. viz., 3 *Cerionis*, 1 *Ithaginis*, 3 *Gallopardix*, 2 *Polyplectron*, 1 *Argus*.

Sub-fam.—Phasianinæ, 3 gen., 2 sub-gen., 16 sp., viz. 3 *Gallus*, 7 *Euplocamus*, 1 *Pucrasia*, 3 *Phasianus*, 1 *Thamalea*, 1 *Lophophorus*.

Sub-fam.—Tetraoninæ, 2 gen., 2 sp. viz., 1 *Tetragalus himalayensis*, 1 *Lerva nivicola*.

Sub-fam.—Pteroclininæ, 1 gen., 4 sp., viz., 4 *Pteroclis arenarius*, *fasciatus*, *alchata*, *exustus*.

Sub-fam.—Percidinæ, 8 gen., 22 sp. viz., 1 *Numida*, 4 *Francolinus*, 1 *Caccabis*, 2 *Perdix*, 1 *Rhizotheria*, 4 *Arboricola*, 3 *Rollulus*, 2 *Percidia*, 4 *Coturnix*.

The Chukor and the Monal (*Perdix chukor* and *Lophophorus impeyanus*) occur in the Himalaya. Mr. Blyth created the genus *Sacca*, from the Tibetan Sak-pha, the *T. hodgsoniæ Blyth*. The essential characters of this genus or sub-genus are as follow: Bill, strong with a heavy overlying upper mandible, scarped along the cutting edges. Nares subvertical and opening towards the head. Wings and tail longer, and less bowed and gradated, and stronger than in *Perdix*; but not so long or acuminate as in *Lerva*, and about equal to *Francolinus*. Wings with 3-4-5 quills longest and nearly equal, 1-2 not much gradated: 1st, only $\frac{1}{2}$ inch less than the longest. Tail 16, rounded, firm. Tarsi moderate, equal to the longest toe and nail, nude, bi-scaled in front, no spur? Lateral toes subequal and furnished with the usual basal membrane. Nails blunt, scooped inferiorly and having a salient margin all round: orbits subnude as in *Arboricola*. This fine species is obtained in the western part of the province of Tsang.—*Royle's, Ill. Him. Bot. p. 36.*

PERE-ARETEI. TAM. *Alpinia galanga.*

PEREI PASTAWANE, TRANS-INDUS. *Fluggea virosa, Roxb.*

PERENA TEREGRAM, MAL. *Ficus glomerata, Roxb., Willde.*

PERE-MARAM, TAM. *Ailanthus excelsus.*

PERFUMERY, the exports from India, are nearly all from Bombay to China, Great Britain, France, Arabia and Persia.

1858-59.... „ 5,989 1860-61.... £ 8,458

PERGAMOS, a kingdom bequeathed to the Romans by the last Attalus; and its library,

transported by Cleopatra, to enrich the Alexandrian collection, is said to have been destroyed by the barbarous zeal of the caliphs. The provinces of Asia, contributed to erect in Pergamos a magnificent temple of Augustus, the pagoda of which, having eight columns, is represented on many of its medals. All the Pergamenean coins, according to Spanheim, bore the figure of a serpent; and we may perhaps discover the cause of this device, in the devotion of the people to the worship of *Æsculapius*. They looked back to the period in the regions of fable, when their city was favoured with his presence; and the annual games in his honour and the erection of a temple for the celebration of his rites, testified their respect and reverence for the legend. In the *Æsculapian* worship the serpent invariably entered; a live animal of the draconic species was always preserved in the sanctuaries of the god; and, hence, as a "genius loci," and an emblem of the tutelar divinity, the serpent figures upon the coins of Pergamos. It is remarkable, that the city exhibiting the device upon its coins, should be stigmatised as the place "where Satan dwelleth"—the old serpent, the dragon of the apocalypse. It is evident from the representation of the apocalyptic writer, that the Pergameneans were deeply sunk in superstition and vice, and familiar with the most obscene and degrading rites of heathen worship. The picture drawn by the sacred writers of the condition of the gentile world, is gloomy and revolting; but the evidence of contemporary profane annalists, affords an ample confirmation of its fidelity. In describing the licentious manners of the Cretians, the Apostle Paul cites a prophet of their own, to corroborate his statement.

Modern free-thinkers have attempted to find something deeply philosophical in the religious rites of the ancients; but in tracking the labyrinth of their sacred ceremonies, the most vicious scenes present themselves in bald and undisguised deformity; and even supposing the inculcation of moral truth to have been intended in some of the mysteries, it is difficult to conceive, that any feature of its original character remained, after the nauseous and disgusting medium through which it passed.—*Milner's seven Churches of Asia*, p. 240.

PERGULARIA GLABRA, *L.* Syn. of *Vallis perglanūs*, *Burm.*

PERGULARIA ODORATISSIMA, *Smith*, *W. Ic., W. Contr.*

Asclepias odoratissima, *Roxb.*
Cynanchum odoratissimum, *Lour.*

Cowslip creeper, Eng. | *Sita manoharam*, TEL.
Fragrant pergularia, " |

A creeper with a climbing woody stem, cracked bark, flowers yellow, and very fragrant,

well adapted for covering trellis work: furnishes a perfume. In the gardens in Moulmein, often cultivated. *Pergularia pallida*, is given by *Wight.—Jaffrey; Mason.*

PERGULARIA TINCTORIA, *Spr.* Syn. of *Marsdenia tinctoria*, *R. Brown.*

PERGUNNAH. In the mahomedan law revenue system, a *pergunnah* is a sub-division of a *soobah*. The N. W. Provinces of India excluding the Saugor and Nerbudda territories comprise no complete *soobah*, but only portions of the four *soobahs* of Agra, Allahabad, Delhi, and Oudh. Each *soobah* was divided into a certain number of *circars*, and each *circar* into *pergunnahs* or *mehals*, (which are used as equivalent expressions,) and the *pergunnahs* again are aggregated into *dustoor* or districts, and as the *pergunnahs* of the *dustoor* are of course always contiguous, the *dustoor* statement in old registers, if copied with any regard to correctness, frequently forms a very important means of the verification of doubtful names. *Soobah* is an Arabic word, signifying a head of money, or a granary. *Circar* is literally a chief, a supervisor: *dustoor*, besides signifying a rule, is also a minister, a moonshee. *Pergunnah* means tax-paying land, as well as a perfume composed of various ingredients. The title of *Soobahdar*, or lord of the *soobah*, is long subsequent to Akbar's time. *Sipahsalar* was then the only designation of the emperor's viceroy in each *soobah*.—*Elliot*.

PERIA-TAMBIRAN, *Tam. lit.*, the great god, the name of an image in the temples of the *gramadevata*.

PERICLYTE. The mahomedan doctors so read the word *paraclete*. *Periclyte* means illustrious, and they quote it from the forged gospel of St. Barnabas, of which the *Moriscoes* in Africa have a Spanish translation.—*Sale's Koran*, P. D., p. 9; *Chatfield's Hindoostan*, p. 271.

PERICROCOTIDA, a family of birds embracing 1 gen. 8 sp. of *Pericrocotus*, of the sub-family *Campephaginæ*, the minivet birds.

P. speciosus, *Lath.*, of British India and Malaya.
P. roseus—? China.
P. flammeus, *Forster*, of S. W. India.
P. brevirostris, *Vigors.*, Himalaya, Assam.
P. igneus, *Blyth.*, Malacca.
P. xanthogaster, *Raffles.*, Sumatra.
P. miniata, *L.*, Java.
P. elegans, *McClelland.*, Assam, Burmah.

Adams describes the *Pericrocotus peregrinus* or crimson flycatcher pursuing their gambols around the tall walnut-trees of a Cashmere hamlet. He says the flammeous flycatcher (*Pericrocotus flammeus*) represents a genus of beautiful birds. There are besides various other species, such as the rose-coloured, (*P. roseus*), found in Continental India; the short-billed flycatcher, (*P. brevirostris*), a native

of the eastern Himalaya; and the black and scarlet thrush (*P. speciosus*) of Latham, skins of which he had seen from the western Himalaya, but never had the good fortune to meet with the beautiful bird. The flammeous flycatcher frequents woods and forests. He had seen flocks at elevations of from 8,000 to 9,000 feet, flitting among the pine-tops and frolicking with each other, or sporting about in quest of insects, the deep red of the males contrasting with the brilliant yellow of the females. Their call is loud. The gaudy lesser crimson-breasted flycatcher (*Pericrocotus peregrinus*) he says is a tenant of the woods and hedges. Sometimes flocks of males, at other times females only, are observed, the rich and beautiful plumage of the former is very striking; insects and larvæ constitute its favourite food.—*Adams; Jerdon.*

PERIDOT, is difficult to polish from its softness, its colour evaporates from exposure to light. The peridot of the deepest green are the most esteemed but they vary greatly in colour.—*King, p. 37.*

PERIM. An island in the Straits of Bab-el-Mandeb, several miles and a half from the Arabian, and eleven miles from the African coast. It is termed by the author of the *Periplus* of the Erythraean Sea, the island of Diodorus, and is known amongst the Arabs, as Mayoon. Perim is attached to the Government of Aden. Its formation is purely volcanic, and consists of long, low, and gradually sloping ranges of hills, surrounding an excellent and capacious harbour, about a mile and a half in length, half a mile in breadth, and with a varying depth of from four to six fathoms in the best anchorages. The hills have formerly been intersected with bays and indentures, which in the course of time have been filled up with coral and sand, and are now low plains, scantily covered with *salsola*, sea lavender, wild mignonette, and other plants which delight in a salt, sandy soil. These plains occupy about one-fourth of the island, and occur principally on the north side. The rocks which are all igneous, are no where exposed, save where they dip perpendicularly into the sea; they are covered with a layer of volcanic mud, of from two to six feet in depth, above which is another layer of loose boulders, or masses of black vesicular lava, in some places so thickly set as to resemble a rude pavement. The highest point of the island is 245 feet above the level of the sea. All endeavours to procure water upon it have failed, and but a scanty supply is procurable from the adjacent coasts. Water-tanks have been constructed, which are chiefly supplied from Aden, and it is proposed to erect reservoirs to collect the rain, as well as a condensing apparatus. Perim has never been

permanently occupied by any nation save the British. Albuquerque landed upon it in 1513 on his return from the Red Sea, and, having erected a high cross on an eminence, called the island Vera Cruz. (The Portuguese in Asia, Vol. i, p. 193.) It was again occupied for a short time by the pirates who frequented the mouth of the Red Sea, and who amassed considerable booty by plundering the native vessels engaged in the Indian trade. They formed a project of settling here, and erecting strong fortifications: but having with much labour, dug through the solid rock to a depth of fifteen fathoms, in a fruitless search for water, they abandoned their design, and removed to Mary's island, on the east side of Madagascar. (Hamilton, Vol. i, p. 43.) In 1799 it was taken possession of by the East India Company, and a force under Lieut.-Col. Murray was sent from Bombay to garrison it, with the view of preventing the French troops, then engaged in the occupation of Egypt, from proceeding to India, to effect a junction with Tippoo Sultan; but it was found untenable as a military position, and as the Straits were too broad to be commanded by any batteries on the shore,—the troops were accordingly withdrawn. Of late years, however, in consequence of increasing steam navigation in the Red Sea, the attention of the Indian Government has frequently been directed to the necessity of a Light-house, to facilitate the navigation of the Straits: Perim was consequently re-occupied in the beginning of 1857, and a number of labourers sent to commence the work. The island is trachytic; the culminating points reach an elevation of 228 feet, and prove that the island itself is the result of a volcanic eruption under the sea. The lava had first raised up the large bank of madreporé which covered the bottom, and had then forced its way through the interstices, and become visible over the water, the vast crater of this volcano has embraced the bay of Perim, and in course of time covered the new island with mud, ashes, trachytic blocks, &c., and then became extinguished. The pirate fleets of Perim and Bulsar used to attack the fleets of the neighbouring states. Bab-el-Mandeb is 20 miles broad. Perim and other small islands are on its northern shores.—*Playfair's Aden; Maury's Physical Geography*, pp. 123, 247. See Bab-el-Mandeb, India.

PERIOPHTHALMUS, a little mud fish, found in great quantities on the mud banks of the Ganges delta, in company with the scarlet crab. Sharks are numerous in the Soonderbuns; the hammer headed shark, one of the *Zygæna* is also occasionally caught off the Sandheads.

PERIPLOCA APIHYLLA, Duch.
 Bata, PANJAB. | Barratta, barre, PANJAB.

A plant with leafless erect stems, common in many places Trans-Indus, and in the Salt Range, and occurring in the outer hills east to the Chenab, occasionally up to 3,500 feet. In parts of the Peshwar valley it is so common as to be used for fuel. It is eaten by goats, the buds are eaten raw, or cooked as a vegetable; and as food, they are considered to have a beneficial effect on wounds.—*Dr. J. L. Stewart*.

PERIPLOCA INDICA, Willd. *Hemi mus indicus*, R. Brown.

PERIPLOCA SECAMONE, is said to be used to adulterate Scammony.

PERIPLOCA SYLVESTRIS, Willd.

Gymnema sylvestre, R. Br.
 Root of wild Periploca. | Sirroo coorinja vayr, TAM. Binuge, SINGH.

This bitter root is supposed by the native practitioners to possess virtue in cases of snake bite. Internally it is prescribed in decoction and the powder is applied to the part that is bitten. The root is supposed to possess virtues similar to *Ipecacuan*.—*Ains. Mat. Med.*, p. 314.

PERIPLOCA TUNICATA, Retz. Syn. of *Cynanchum pauciflorum*, R. Br.

PERIPLUS of the Erythræan sea. Letronne supposes that the author of this voyage wrote in the time of the emperor Septimus Severus and his son, namely, between the years 198

and 210 of the Christian era. Dean Vincent supposes it to have taken place about the tenth year of the reign of Nero (A. D. 64). It was doubtless near, but subsequent to this era. Periplus, seems a record of an experienced sailor who had navigated the Red Sea, the Persian Gulf, and the coasts of Malabar and Coromandel who had resided many years at Baroach, in the court of a hindoo rajah. He describes Arabia as having pilots, sailors and persons following maritime pursuits. He mentions that large vessels were navigating the Bay of Bengal to the Ganges and Chryse. See Aden, Kalian.

PERISTROPHE LANCEOLARIA. One of the *Acanthageæ*; *Peristrophe speciosa*, *Peristrophe montana*. Vide *Justicia*.

PERISTYLUS. This elegant terrestrial orchid with snowy blossoms is occasionally seen in Tenasserim, Wight in *Icones*, gives *Peristylus exilis*, *Lawii*, *plantagineus*, *richardianus*, *robustior*, and *spiralis*, and Voigt gives *elatus*. W. V.

PERITA CHETTU, or Kharjurapu chettu, TEL. *Phoenix dactylifera*, L.

PERIWINKLE, *Vinca major*, the Greater Periwinkle has flowers of a fine purple-blue colour, and larger than those of any other species. The English name, Periwinkle, seems to be derived from the French, *Pervenche*. In Chaucer's time it was called *Perwinke*:—

"There sprang the violet al newe,
 And fresh perwinke rich of hewe."

In olden times great virtues were attributed to the Periwinkle; amongst other things, Culpepper says, "the leaves of the Periwinkle eaten by man and wife together do cause love between them." In Italy this plant is called *Fiore di Morte*, from the practice of making garlands of it in sorceries and incantations, hence the French still call it *Violette des Sorciers*. *Vinca minor*, Lesser Periwinkle, has procumbent stems; the flowering stems usually erect. It is a native of Europe, in the same situations as *v. major* and is often found in Great Britain.—*Eng. Cyc.*

PERIWINKLE TREE. *Calpicarpium roxburghii*:

PERIYA-PALAYAM, see Hindoo.

PERJI, MALAYALA, a tree of the forests of Malabar and Canara, about twelve feet in height, and ten inches in diameter. Its timber is very hard and strong, is used by the natives for knees and boat timbers; but is ranked among the jungle-woods of the coast.—*Edye, Forests of Malabar and Canara*.

PERKENIER, see Ai island.

PERKHATUNA, HIND. *Cocculus laeba*.

PERNA, a genus of molluscs.

PERNAMBUCO COTTON, *Gossypium acuminatum*. Humboldt mentions that in the equinoctial regions of America, cotton extends

to nearly 8,000 feet above the level of the sea, but in Mexico, 22° of N. latitude, it reaches only to 5,500 feet. In the Himalaya Royle had seen it about 4,000 feet in the tract between the Ganges and the Jumna rivers; Dr. Govan mentions it as extending with the sugar-cane to about 4,200 feet between the Jumna and Sutlej rivers; both situations are within 28° to 31½° of N. latitude, but in neither is it cultivated to any extent, a few plants only are grown about the villages, of which the produce is used up by the women of the family. Mr. Trail mentions that the cotton of the Kemaon district is superior in softness of texture, gloss of colour, and length of fibre. It is generally admitted that the quality of cotton improves in proportion to its vicinity to the sea; but the Pernambuco cotton is said to be injured by this proximity, and to improve in proportion as its cultivation advances into the interior (Koster's Brazil.)—*Roxb.; Royle's Ill. Him. Bot., p. 88.*

PERNINÆ, a sub-family of birds, 2 gen. 3 sp. viz., 2 Baza, 1 Pernis.

PERNING-KOLLEN, see Kummaler.

PERNIS APIVORA. Honey Buzzard of Europe, Asia, N. Africa; migratory. In India common (if identically the same), in addition to *P. cristata*. In the crestless or sub-crested Indian specimens (adults), there is a marked tendency to the development of three dark stripes on a white throat, and in the *Astur trivirgatus* and sundry other Indian species. Can such be a hybrid race between *P. apivora* and *P. cristata*?

PERONIA, a sea slug-like greenish-coloured creature found on the rocks of Formosa and Borneo.—*Colla.*

PERRY. A fermented liquor made from the pear fruit, in the same manner as cider is from apples. It is chiefly made in Worcester-shire.

PERSEA of the Ancients, fruit of *Balanites egyptiaca*,

PERSEA GRATISSIMA, *Gærtn.*
Alligator pear, ENG. | Avocado pear.

P. gratissima is the Avocado pear of the West Indies, and receives its name in consequence of the resemblance in form between its fruit and that of a European pear. The plant which bears it is a tree about the size of an apple tree; the leaves are oblong, veiny, and the flowers small, and of a greenish yellow colour. The fruit is the size of a large pear, and is regarded as one of the best produced in the West India islands. In the inside it is yellow, and contains a kernel inclosed in a soft rind. In taste it is said to resemble the peach, but to be much more agreeable, though not so sweet. It is sometimes eaten with pepper and salt, but more frequently with a little

ugar and lime-juice. Three varieties are mentioned, the red, the purple, and the green. — *Wight's Icones*, 1823; *Eng. Cyc.* See Dyes.

PERSEPOLIS, we do not know whether it was originally called Elumais, Istaker, or Pakht-i-Jemshed. After the establishment of the empire by Cyrus, he and his immediate descendants divided their residence chiefly between Babylon, Susa, and Ecbatana. He was a conqueror long before he was a king; and while Sardanapalus, his father, reigned in Persia and occupied his own capital; and Cyaxares his uncle yet lived, and maintained his state in Ecbatana, the principal city of the Medes, the present Hamadan, Cyrus resided at times in Babylon, which he had subdued, and then afterwards at Susa, when the death of Abradates gave the whole province to his generous prince and friend. Cyrus did not live more than eight years after he became master of the empire, and therefore could not have had much time to distinguish Persepolis by any long residence there; though he often went thither. We learn from several writers, that at different periods both Cyrus and his successors had added to the splendours of the city which the Greeks called Persepolis. Xenophon clearly points out its situation. (Strabo. Diod. Siculus.)—*Porter's Travels*, Vol. i, pp. 576, 577. See Hindoo, Istakhr, Jamshid, Persian kings.

PERSIA. The territory known to Europeans by this name, is called by its people Iran. Pars or Fars, from which the term Persia is derived, is a province of the country called by the Greeks *περσις*, Persis, which contained the chief city, and the most splendid of all the Royal palaces. From Pars is also formed Parsee, the Aryan race who are now following the tenets of Zoroaster. The entire southern region of Fars, bordering on the Persian Gulf, is called the Garmsair or "hot region." It extends from the sea to the latitude of Kazeroon, and runs parallel with the Persian Gulf, from the banks of the Tab to the confines of Laristan; from Bushire, eastward as far as Cangoon, the tract is named the Dushtistan or "land of plains." The Tungistan, commonly pronounced Tungistoon, or "narrow land," is a small tract of land east of Bushire. The greater portion of the people of the whole Garmsair, are an independent lawless set, many of the tribes being robbers by profession. A huge wall of mountains separates the Garmsair, or low region, from the Sardsair, or high table-land of Persia. One of the most conspicuous of these, is an abrupt lofty hill, named Hormooj, where specimens of coal were found. Sardsair signifies "cold region." It is also termed the Sarhada, a word literally signifying "boundary or frontier," but generally applied to any high land where

the climate is cold. Persia has hardly one river which can be termed navigable, unless the Euphrates and the Tigris may be considered as belonging to that empire. The Karoon in Khuzistan, the Arras or Araxes in Aderbijan, and the Heilmund, which flows through the province of Seistan, are the largest within its ordinary limits. The rains, except in Mazenderan, are neither frequent nor heavy. Of the deserts of Persia the most celebrated is that called the Great Salt Desert. It extends from the vicinity of the cities of Koom and Kashan to that of the sea of Durra and the district of Tarshish; and from the province of Kerman to that of Mazanderan, being in length about four hundred miles, and in breadth two-hundred and fifty. It may also be said to join the deserts of Kerman and Segestan, and like those of Arabia is impregnated with nitre and other salts. The deserts of Kerman, Segestan, Mekran, and Kuzistan, are mentioned in the article Deserts. Kara-Kam, or the Black Desert, divides Khorassan from Karizm, and extends from the foot of the mountain to the north of Meshed, as far as the Lake of Arral. Persia has an area of about 26,000 miles, with a population of 10,000,000.

Mahomedans, Shiah	7,500,000
" Sunni	1,500,000
Christians, Nestorians	100,000
" Armenians	200,000

The rural population may be about four millions, and there are four great cities Isfahan 60,000, Teheran 80,000, Tauris and Meshed, each 100,000.

The ordinary revenue of the crown, is about two millions but much of the land is held under agreement to give military service. The crown revenue is derived chiefly from land and the tax averages about 20 per cent. of the gross produce. The marriages are of two kinds, one the "aqdi" with a girl of the bridegroom's own rank, the other, the "seegha" from the women of humbler birth. Many of the women read and write, especially the Kajar women. The happiest and most glorious era of Persian history was when that country was governed by the first monarchs of the Seljookian dynasty of Tartar princes. The most ancient of the races that ruled in Persia, was the

Peshdadian dynasty. Of the fourteen known names of this dynasty, the first was Kaiumars, by some supposed to be Adam or Noah, who reigned at Balk; in this line, we notice the name of Jamshid who reigned at Persepolis; Feridun, who was restored by Kawa, the blacksmith; and Afrasiab who was king of Turkistan.

The *Kaianian* dynasty followed the Peshdadian, and amongst its names are Kai Kobad (Kai signifies the mighty). Kai Kaus, son or grandson. Rustam his general. Kai-khosru, grand-

son, Cyrus the great. Lohrasb, son of Orond Shah. (Cambyses omitted.) Gushtasp, his son, Hystaspes of Grecian history. Isfendiari, his son, Apanda or Astyages of do. Kai Bahman, or Ardashir daraz-dast, Artaxerxes Longimanus.

Homai, daughter and wife of ditto.

Darab, son of ditto.

Dara, his son, the Darius overcome by Alexander the Great.

The petty kings, Muluk-ut-tawaif, who follow Alexander, called by the Persians the Ashkanians and Ashganians, are the Arsacidæ of the Greeks.

Ardashir Babegan bin Sasan, Artaxerxes, the first of the Sassanian kings, A. D. 226.

Ardashir (Artaxerxes ii, the 10th), A. D. 81.

Ardashir iii, (the 25 Sassanian) in A. D. 629 under whom anarchy prevailed.

Ardashir-daraz-dast, or of the long arm, was Kai Bahman, the Artaxerxes Longimanus of the Romans.

After the death of Alexander the Great, Persia as well as Syria, fell to the lot of Seleucus Nicator, who established the dynasty of the Seleucidæ. Antiochus Soter succeeded Seleucus Nicator, and in the reign of his successor, Antiochus Theos, Arsaces, a Scythian, who came from the north of the sea of Azoff, induced the Persians to throw off the Greek yoke, founded the Parthian empire, and made Rhages his capital. This was likewise the period of the foundation of the Bactrian kingdom by Theodotus the governor of it, who finding himself cut off from Syria by the Persian revolution, declared his independence. Arsaces is called Asteh by eastern writers, and is said to have been a descendant of the ancient Persian kings. When he gained the kingdom it is said he promised to exact no tribute and merely to consider himself as the head of a confederacy of princes, united for the double object of maintaining their independence and freeing Persia from a foreign yoke. This is the commencement of that era of Persian history called by eastern writers, Muluk-ut-tawaif, or commonwealth of tribes.

Chor-saci, is an ancient term by which the Scythians designated the ancient Persians. Baron DeBode supposes the town of Ardea in Fars near the mountainous region of Ardekan, to have been one of the chief towns of the ancient Persians. The Persians built Al maidan out of the ruins of Babylon.

Koornah, is one of these three Apameas built by Seleucus in honour of his first wife, Apamea, daughter of Artabazus. It is situated at the point of a triangle, formed by the confluence of the rivers Euphrates and Tigris, and although now dwindled into a petty town, it was formerly a place of consequence. Koor-

nah is situated on a low flat, with apparently a rich soil, and along the river are low banks to prevent the country being flooded. At this spot some oriental traditions have fixed the Garden of Eden.

It was at Nahavend, in A.D. 632 (Hejira 21) that the celebrated battle of Kadesia was fought, in which the troops of the caliph Omar, commanded by the Arab chief Noman, who was there slain, defeated the Persians in the reign of Yezdejerd, one of the Sassanide princes. This monarch, shortly after his defeat, was killed by a miller of Merv, with whom he had taken refuge. The dynasty of the Sassanides had reigned in Persia 415 years; it became extinct with Yezdijerd, and Persia then fell under the dominion of the caliphs, who compelled the population to embrace Islamism. The town of Nahavend is built just at the foot of the north-east range of hills, upon some craggy points. In the centre of the town rises the citadel, a most imposing-looking structure, and really of some strength. It crowns the top of the highest of the craggy points upon which the place is built, and is supported by immensely solid mud walls from without, rising at least 100 feet high.

The battle of Kadesia fought in the year of the Hejira 21 (A.D. 632) under the kaliph of Omar, by the Arab general Saad, against Rustum, the commander-in-chief of the Persian army, in the reign of Yezdijerd iii, the last of the Sassanian race. This battle lasted three days, at the end of which the Arabs were victorious and the Persian monarchy destroyed. In A.D. 906, Rhages was taken by Ismail, founder of the Samanee dynasty. It ceased now to be a seat of empire, and in A.D. 967 became the capital of the house of Shemgur, a race of petty princes who maintained a kind of independence, while the dynasties of Saman and Dilemee divided the empire of Persia. In A.D. 1027, Rhages was the last conquest of Mahmud of Ghuzni.

Timur Lung, usually called Tamerlane, succeeded to the throne of Chaghatai at Samarcand in 1370, being then in his thirty-fourth year. Spent two years in settling his own kingdom and putting down opponents; and then proceeded to extend his dominions by seizing on all others. In addition to Persia he extended his victories over Asia Minor, Syria, Armenia, Georgia, Tartary, Hindoostan, and a great part of Persia. He penetrated to the confines of Siberia, and plundered Moscow. He had placed on his own head no fewer than twenty-seven crowns; and was about to essay the conquest of China with an army of 200,000.

In the beginning of the seventeenth century, during the reign of Shah Abbas the Great, the English first established commercial settle-

ments in Persia. Two enterprising Englishmen, Sir Anthony Sherely and his brother, with a few followers, had made their way to the court of Persia, where they met with a distinguished reception. Sir Anthony returned as envoy from Shah Abbas to establish an alliance with the christian monarchs of Europe for the destruction of the Turks and with a grant. Permitting all christian merchants to trade freely with Persia. Under the patronage of Shah Abbas, the English, the French, and the Dutch had established factories at Gombroon, to which place the Persian monarch afterwards gave the name of Bunder Abbas or the Port of Abbas, by which it is now known. Shah Abbas, however, had less toleration for the Portuguese, who, in 1507, under Albuquerque, had conquered and occupied the island of Hormuz, at the entrance of the Persian Gulf, not far from Gombroon, and he resolved on their expulsion. He was joined in this enterprise by the English, then at war with Portugal, with whom in 1622 he entered into an engagement granting them half the plunder of the island and half the future customs of Gombroon and Hormuz. The Portuguese were driven out, but the promises of the king of Persia to the English were not kept. The factory at Gombroon was maintained through many losses and disasters till 1761, when it was withdrawn in consequence of the oppressions of the provincial Governor of Lar. The death of Shah Abbas in 1628 was followed by the rapid fall of the Suffavean dynasty. Four weak princes of that house successively ascended the throne of Persia. During their reign the Turks severed from the Persian empire some of the best of the western provinces, the Arab ruler of Muscat possessed himself of the islands in the Persian gulf, the Affghans of the Abdali tribe made themselves independent in Herat and the Ghilzies in Candahar; and in 1722, within a century after the death of Shah Abbas, Ispahan was besieged by Mahmud of Candahar, to whom Shah Hossein formally resigned his crown. The Affghan dynasty was short-lived. Mahmud died insane in 1725. His cousin and only successor Ashraf was slain in 1730 while fleeing in the desert before his conqueror Nadir Kooli Khan, the warrior Nadir Shah. After the abdication of Shah Hossein, his son Tamasp had assumed the name and state of king, and was unceasing in his feeble efforts to recover the crown. Shah Tamasp was permitted to enjoy his nominal sovereignty only two years, when he was dethroned by Nadir Kooli, who, with affected reluctance, accepted the crown. Little had remained of Persia in the feeble grasp of Shah Tamasp, when, in the year 1726, Nadir Shah, after a life of vicissitudes, found himself at the head of a band of

robbers in Khorassan, at the age of about thirty-five. The genius of this man alone quickly changed the aspect of affairs, and Persia, from being trodden under foot by all, became, during his lifetime, a formidable empire, and enjoyed once again the glory, such as it is, of being a conquering nation. The first exploit of Nadir Shah was the conquest of Meshed, and the rescue of all Eastern Persia from the Affghans; the next was his victory at Hamadan over the Turks, and their expulsion from Azerbaijan and the other western provinces of Persia. While he was besieging Erivan he received the news that the Affghans had again invaded Persia: so he turned round, beat them, and took Herat and Ferrah. He forced the Russians to abandon, by treaty, all conquests on the Caspian Sea, preparatory to his attack on Turkey, and then dethroned his imbecile sovereign Shah Tamasp, whom he had first taken the pains thoroughly to discredit. He failed in an attack on Bagdad, but was successful in Georgia and Armenia, taking the cities of Gengah, Tiflis, Kars and Erivan, the former possessions of Persia in those parts. After his seizure of the throne, he subdued the Bakhtiyari and put Teheran in safety; he then marched 80,000 men and took Candahar and Cabul; sending kind and flattering letters to the Tatar chiefs beyond the Oxus, whose country he did not want, telling them that he would never invade the rightful inheritance of the descendants of Gengis Khan and the high Turcoman families. He thus secured his rear, and affecting indignation and necessity, advanced to the attack of India, because the emperor of Delhi had not answered his letter requiring the reddition of certain Affghan chiefs. In a rapid and successful march he passed through Lahore, beat the emperor Mahomed Shah, and entered Delhi in 1739. The inhabitants were respected till on a report of his death, they rose upon his troops. He then at last gave orders for a general massacre. While it raged, Nadir sat alone and gloomy in a mosque, where Mahomed Shah found him, and entreated him to spare his people. The emperor of India should never sue in vain, replied Nadir, who gave orders for the carnage to cease; so great was his discipline and power over his troops that he was immediately obeyed. After restoring the emperor to his throne, he returned to Persia, conquering on the way Scind, Balkh, Bokhara and Khaurism or Khiva. Meshed was his new capital, whence he made expeditions against the Lesghins and Turks: becoming gloomy and cruel during the last six years of his life, he was murdered in 1747. Under Nadir Shah, the Persian empire had recovered for a time its former glory. He not only recovered the provinces conquered by the Turks and the Russians, but

reduced Sind, Candahar, Cabul, Balkh, and the whole country between the Oxus and the Caspian sea, carried his arms to Delhi, which he gave up to plunder and massacre, and compelled the emperor of Delhi to cede to him all his possessions west of the Indus. Within a few years after his murder in 1747, the mighty empire which he had re-created was dismembered. Ahmed Khan, Abdali, proclaimed himself king of the Affghans, took Candahar and Herat and laid the foundation of an empire which he extended by conquests more brilliant than those of Nadir Shah. The province of Khorassan was all that was left to Shah Rokh, the blinded grandson of Nadir Shah. This was guaranteed in his independent possession by Ahmed Khan, but was soon broken up into a number of independent principalities. The southern and western provinces of Lar, Fars, Irak, Azerbaijan and Mazenderan were subdued by Karem Khan of the tribe of Zend, and a prince of the Suffavean house named Shah Ismael, a son of the sister of Shah Houssein, was set up as a king. But he was a mere puppet and was soon cast into prison, and Karem Khan ruled alone. He was a just ruler. In 1763 he granted to the British a firman for a factory at Bushire and for the trade of the Persian rule. Karem Khan died in 1779 after a vigorous rule of twenty-six years. His death was the signal for fresh revolutions marked by the most atrocious cruelties, in the course of which the four surviving sons of Karem Khan were savagely mutilated. This state of things ended in 1795 in the elevation to the throne of Persia of Aga Mahmud Khan of the Kajar tribe, the founder of the present dynasty. In 1788, during the brief rule of Jaffir Khan, nephew of Karem Khan, and the last representative but one of the Zend family, the British who, during the revolution, had been subjected to many oppressive exactions, obtained through the chief of their factory at Bussora another firman for unrestricted trade in the Persian dominions. From the success which had attended the invasion of India by Nadir Shah and Ahmed Shah, Abdali, it was believed that the plains of India were exposed to be periodically ravaged by any ambitious ruler in Afghanistan. In 1796, Zeman Shah, grandson of Ahmed Shah, Abdali, advanced to Lahore with the professed purpose of restoring the house of Timour from the domination of the Mahrattas, and after some years in 1801, Captain Malcolm was sent on an embassy to Persia. The re-conquest of Afghanistan was always a favorite dream of the Kajar dynasty, who conceived that their rights of sovereignty over that country were as complete as in the days of the Suffavean kings. In 1828 Futtch Ali Shah was induced by the

Russians to advance on Herat, the key of Afghanistan, but, two expeditions were unsuccessful. His son Mahomed Shah, who was ever a friend of Russia and an enemy to British interests, revived the project, and with a large force laid siege to Herat, on 23rd November 1837. To force the Shah to renounce his ambitious projects, a demonstration was made in the Persian gulf by the occupation of the island of Kharack. This induced him to withdraw from Herat after a siege of ten months, during which all his efforts had been frustrated by the energy and ability of Lieutenant Eldred Pottinger, an officer of the Bombay Artillery. Mahomed Shah died in August 1848 and was succeeded by his eldest son Naseer-ood-deen. On the death of Yar Mahomed Khan his successor feeling himself insecure in power, and being threatened by the Ameer of Cabul and by Kohun-dil Khan from Candahar, Syud Mahomed Khan made overtures to Persia, and a force was despatched by the Shah nominally to reduce the Turkomans, but in reality to occupy Herat. A force was sent in December 1855, in violation of the agreement which had been made by the Persian government. Mahomed YusooF was taken prisoner, and Herat was captured on 26th October 1856. The quarrel could not be adjusted, and a force was sent from Bombay to occupy Kharack, and on the 1st November 1866 war was declared. After a brief successful campaign under Sir James Outram, a treaty of peace, concluded 3rd February 1857, was signed at Paris on the 4th March 1857. In this the previous treaty was adhered to for the abolition of slavery in the Persian gulf. In 1861 an attempt made to arrange for a telegraph line through Persia to Bunder Abbass, failed, but in 1863, the king resolved in constructing a line from Khanakia on the Turkish frontier, through Teheran, Ispahan and Shiraz to meet the British line at Bushire.

The entire town population of Persia does not exceed, if it equals eight millions of souls. The country is very thinly peopled; and a great proportion of it being a barren desert is destitute of inhabitants. The entire annual revenue amounts to about three millions of tomans, not quite a million and half sterling. Persia resembles the highlands of Scotland, in being divided among tribes, the chiefs of which command great respect. Persia is a thoroughly aristocratic country, where high birth and polished manners are much considered. In this point it differs much from Turkey and even Russia, where the feeling is thoroughly democratic, that is to say, Turks and Russians cannot feel or understand why, because the father has been distinguished, the son should be respected. Perhaps one-third of the inhabitants of Iran are

nomadic, and this section, by its habits, as well as mode of life, constitutes a race separate from the other or fixed portion, which consists of Persians, Kurds, Armenians, Arabs, Jews and Parsees. The region intervening between the Euphrates and the Indus is thinly peopled. It is occupied by races, the bulk of whom are nomade and of varied origin bounded by the race on the north, known to Europe as Affghans, by the Brahui mountaineers and the Balooch races of Baluchistan, and races on the sea coast whose origin is unknown. Macdonald Kinneir (*Geog. Mem.* p. 44) questions whether the inhabitants would amount to more than eighteen or twenty millions even including the Iliyat races, who probably exceed the number of those who reside in towns. The word Iliyat is derived from Eel, a Turkish or Tartar word, signifying tribe; to which "aut," an Arabic termination of the plural, is added; a combination not uncommon. The Iliyat tribes in Persia, are of Tartar and Turcoman descent; and of tribes from the Bakhtiara mountains, who are of a race totally distinct from the northern hordes, and, probably, something more indigenous to the soil, than any of the other wanderers; but all lead the same manner of life, and bear the common name of Iliyat their pastoral habits little distinguishing them from the Bedouin Arab, or the nomade Tartar on the banks of the Tedzen. The subjects of the Persian empire therefore consist of two large distinct classes: the stationary inhabitants of towns and cities; and the wandering dwellers in tents and temporary villages. They comprise a very large portion of the population of the country, though their actual numbers are not well known. They are mahomedans of the Sunni sect and herdsmen. Many of the best families in Persia are of Iliyat origin. The present royal family is of the Kajar tribe, a Turkish Eel, which came into Persia with Timur. In winter, the Iliyat either inhabit temporary huts, or follow the sun into warmer districts; the empire of Persia being sufficiently extended to yield a temperate climate somewhere, in almost all seasons. They change their places of encampment with the season and climate, going in the summer to the Yeilauk or quarters where pasturage and water are to be found in abundance; and when the cold of winter sets in, adjourning to the Kishlauk or warmer region, in which their flocks and herds, as well as themselves are better sheltered. Their summer abodes consist of large black tents, made of woven horse-hair, the sides being matting, or dried rushes. They are usually pitched in a quadrangular form on the banks of their hereditary rivers, and under the brow of the mountains which had shadowed their forefathers for unknown generations. Hence, though they wander, it is yet within

bounds. They have a country, and only change their place in it. The nomade tribes of Arabia and of Tartary bear the same character; possessing an extended inheritance, though it be only a desert. The Iliyat constitute the military force: and their chiefs, to whom the tribes are entirely devoted, are the hereditary nobility of the kingdom of Persia. Those in the southern provinces, the Bakhtiari, Fielhi, and Mahmaseni, trace their origin to the most remote antiquity, and are probably the descendants of the warlike bands who inhabited the same country in the days of Alexander. The Kashgoi are a nomade Turkish tribe of about 120,000 families, whose chief is the Il-Khavi of Fars. They and the Bakhtiari from the warm pastures of Arabistan and the head of the Persian gulf, arrive in spring on the grazing of Isfahan. At the approach of winter, both the tribes return to their respective Garmsair or wintering lands. The entire southern region of Fars, bordering on the Persian gulf, is called the Garmsair or "hot-region." It extends from the sea to the latitude of Kazeroon, and runs parallel with the Persian gulf, from the banks of the Tab to the confines of Laristan. From Bushire, eastward, as far as Cangoon, the tract is named the Dushistan or "land of plains." The Tungistan, commonly pronounced Tungistoon, or "narrow land," is a small tract of land east of Bushire. The greater portion of the people of the whole Garmsair, consists of an independent lawless set, many of the tribes being robbers by profession. Each tribe has a separate grazing ground for its flocks: and this land, from long and undisputed possession, is considered as the property of the different chiefs. In the fine season they are continually on the move, in search of pasturage; but, in the winter, several of the tribes, amongst which may be numbered the Karagoosli and Afshar, settle in villages. In Dahistan, Asterabad, and the northern parts of Khorasan, instead of tents they live in small portable wooden houses. They principally subsist on the produce of their flocks, and consequently grow but a very small proportion of corn; they manufacture cloth, as well as several other little articles for their own use, and the most beautiful Persian and Turkish carpets, so much admired in Europe, are the work of the Iliyat. Inured, from their infancy, to arms, to danger, and fatigue, and tenacious, at the same time, of the honour of their tribe, they are at once the prop and glory of their country. Each tribe is divided into "teera" or branches, and each teera has a particular leader, all of whom are, however, subservient to the chief. These chiefs are, both from birth and influence, the first men in the empire; they are always mutually jealous and hostile; and the king, by nicely balancing the power of the one against

that of the other, insures his own safety and the peace of his dominions. It is also the custom to detain at court, either the chief himself or some part of his family, as hostages for the fidelity of the tribe. The Ilyat or "tribes," says Sir John Malcolm, are all soldiers, and generally horsemen. The cities furnish no soldiers to the army except infantry, they are defended by a militia, who sometimes take the field. In their conduct and morals, the Ilyat women are vastly superior to those of the towns and settlements. They are chaste and correct in their lives, and faithful to their husbands. Persians designate as Ilyats, the whole of those tribes who subsist by their flocks, and also that portion which is employed in the pearl fishery. The Ilyats do not admit that they belong to the old Persian stock, but believe themselves to be descended from strangers, who had been attracted by the thirst of conquest, like the Saracens from the west, or the followers of Jengiz Khan, and other adventurers from the east. The Ilyats settled in Persia at a recent period, and have preserved their peculiar habits and customs. The funerals of the Bakhtiyari, for instance, are attended with dancing and other symptoms of rejoicing and if the man should have been killed in battle, the rejoicings (and this is the case also among the Arabs) are on that account the greater. The Ilyats are brought up in ignorance of almost everything, except tending their flocks, weaving tent cloth, occasional cultivation of the ground, and martial exercises. The head of each tribe is its leader in war, or in the predatory excursions; and he practically teaches his hardy followers to despise the peaceable occupations of the cultivators, who, when not sufficiently protected, are frequently plundered of their corn and cattle. The Ilyat chiefs and their families are the only permanent aristocracy of Persia, in which kingdom they occupy a position nearly resembling that of the old feudal chieftains in Europe; and at times they have been raised by their personal talent, aided by fortuitous circumstances, to the throne itself. Fattch Ali Shah, was an instance of this sudden elevation. The Ilyat communities usually consist of twenty or thirty families. They make carpets and tents, and have all things within themselves except clothes, copper utensils, pack-saddles and personal ornaments for their dress, and these they obtain from the Persians. Being entirely a pastoral people, their property is calculated by the number of animals (more particularly sheep) which they possess. These constitute the ordinary medium of traffic, and they are sheared twice in each year. Allowing one-fourth for the usual exaggerations to the east, there would still be about 600,000 families, which, at an average of four and

a half persons to each, would give 2,700,000 Ilyats.

After Persia was overrun by the mahomedans from Arabia and Tartary, most of the people seem to have become mahomedans, and little is known of the history of the fire-worshippers in the years preceding the arrival of a small remnant of them on the coast of Guzerat. On their being presented to the hindoo ruler of that country they avowed their reverence of the cow and its products. This doubtless was done with the object of conciliating the people amongst whom they had arrived, and it is perhaps the sole concession which during the succeeding three hundred years they have openly made to the religions around them. They are a well educated people and many of their women also have been educated. In their habits, they have nothing in common with hindoos, and they retain towards mahomedans a dislike, to call it by no strange term, which has been handed down from the time that they were driven forth, a small band of pilgrims, from their native land. They have largely engaged in commerce and trade, and cling to the British and their customs, their dislike of the mahomedans and the absence of all sympathy on their part with hindoo habits, encouraging their Anglican inclinations.

Bokhara has a considerable number of Persians especially Persian captives, who are brought in small parties. The greater majority, however, of this people were transplanted from Merv, in the reign of Amir Seyid, when that city fell under his sway. With a view of weakening it, and thereby ensure his own safety, he ordered 40,000 families to be transported from Merv to the neighbourhood of Samarkand. It is from them the Persians of Bokhara chiefly descend. The Persian population are easily distinguished by the regularity of their features, and their bushy black hair. They profess outwardly the Sunni faith, though in their hearts they remain Shia, cordially hating, therefore, the Bokharians.

The Persians of Cabul amount to 12,000 families; they reside in a separate quarter of the city, which keeps up an esprit de corps among them; it also gives them a knowledge of their power which may prove salutary or prejudicial to the factions that divide the country according to circumstances. Besides the Tadjiks, who are the original inhabitants of the country, the tribes descended from the Indian stock, and Kuzzilbash sprung from the Tartar conquerors of Persia, there are other nations found in small portions in the country inhabited by the Affghans. It would excite great surprise to find a colony of French or Spaniards settled in a town or country in Great

Britain, and remaining distinct from the people of the country, after the lapse of several centuries, but this is by no means an uncommon thing in Asia. The wandering habits of a great part of the population familiarizes the whole to the idea of migration. It is also frequently the policy of the Asiatic. The most numerous of this class are the Arabs, who have probably emigrated from Persian Khorassan. Many Arab tribes are still to be found in great numbers and power in that country, where they have probably been settled since the first period of the mahomedan conquest, or at least since the time when the Arab dynasty of Samaunee ruled in Bokhara. The number in Affghanistan may be about two thousand families, some of whom form part of the garrison of Bala Hissaur at Cabul, and the rest reside at Jellalabad, between Cabul and Peshawur. These last are under a chief of their own, who is of such consideration, that the daughter of one of his ancestors was the wife of Ahmed Shah, and the mother of Tymoore. They have lost their original language, but they still live in one society, and are all settled and engaged in tillage.

The bravery of the Persian soldiery has been shown in the attacks on Herat, and at the storming of Bast, as well as on other occasions, they possess the important qualifications (for a country like Persia) of cheerfully accomplished long and difficult marches, even when scantily supplied with necessaries. The Persian like the modern Kurd and Turkoman, is almost always mounted; and having been trained from his infancy, he is one of the most expert horsemen in the world. He is, in fact, quite unrivalled in his skilful management of the animal when ascending the steep sides of rocky mountains, which by most persons would be considered altogether inaccessible for a horseman. The Bakhtiyari and other tribes, maintaining a kind of half independence in the mountains, are also very expert riders; but every Persian, man and boy, is a finished horseman, and particularly skilful in loading and firing from the back of the animals. Like his Parthian ancestors, he can turn round when pursued, and fire his long gun directly to the rear. He then gallops off at full speed, hanging down from his saddle on the off side in such a way that the greater part of his body is covered by the horse. It is not an uncommon thing to see a Persian, whilst going at a brisk pace, stoop down, take a sheep, or even a much smaller object from the ground, and carry it off with unrelaxed speed. The sling is just of sufficient length to allow of its supporting the piece over the left wrist, whilst the hand grasps the muzzle, so as to facilitate the loading. On one occasion, a fowling-piece, belonging to Lieutenant Lynch's

party, was thus taken up from the ground, but the timely use of a rifle recovered it. The ancient Persians held that veracity is the mark of piety. The modern Persians are regarded as skilful in dissimulation. Among themselves, with their equals, the Persians of the higher classes who are settled in towns are affable and polite; to their superiors, servile and obsequious; and towards their inferiors, haughty and domineering. All ranks are equally avaricious, sordid and dishonest, when they have an opportunity of being so; nor do they care for detection when they have once reaped the benefit of their superior genius, as they term it, one disagreeable feature in Persian society, being their utter disregard of the truth. With a very few exceptions, they are all alike in dissimulation. Notwithstanding their rapacity and eager pursuit after money, they are by no means niggardly, as far as their own personal gratification is concerned. A Persian loves to make a show with his wealth, however nefariously acquired; and generally spends his money freely in pomp, ostentation, and profligacy. To the Persians have been attributed many of the worst qualities of human nature and his thoughtless extravagance is of itself a root from which many evil branches cannot fail to spring. He is notorious for a total disregard of truth, and for the fraud with which ordinary dealings are conducted. He is devoid of shame in private life, and as insensible to disgrace in public; and, provided he can escape punishment, the most dishonest artifices are viewed as legitimate means of accomplishing his ends. He is superstitious as well as hypocritical in religious matters, faithless in friendship, subject to strong prejudices, and of a revengeful disposition. His minor faults are garrulity and a love of vain display, to which last even personal comforts and cleanliness are too often sacrificed, he is remarked for a dogmatical and egotistical bearing, and a haughty demeanour towards inferiors, with as usual in such dispositions, the utmost servility towards those above him. This dark picture is not, however, without brighter spots. Owing to his politeness towards strangers, and an apparently hospitable disposition, the first meeting with a Persian usually makes a favourable impression, though the offer of his house means no more than the Spanish compliment in like cases; and, it may be the phrase, "it is yours," or "it is at your command," may be easily traced back from Spain into Barbary, and from thence into Arabia. He is, moreover, quick-sighted, sociable, witty and affable, buoyant in spirits, well acquainted with the forms of politeness, and, to a certain extent inquisitive in matters of science and art.

Persians consider the number "thirteen" so

unlucky, that in general, they will not even name it. When they have occasion to allude to this number instead of mentioning sezdeh (thirteen), they say ziyad (much more) or hech (nothing.) The Arab, the Persian, the Affghan and Sikh when speaking of the people of India, only call them "black men," and even in India the mahomedan descendants of the Arab, Persian, Moghul and Affghan conquerors, use the same expressive designation, "Kala Admi," literally black man, being ever in their mouths. And hindoos themselves, in their various tongues, likewise so distinguish themselves from all the fair foreigners.

The offering from an inferior is called pesh-kash. A gift or recompense from a prince or superior is called inam, or khelaat, also baklishish, a Persian word much used in this sense by the Turks.

The dress of Persian women consists of a pair of immensely wide trowsers, like a couple of petticoats tacked together, made of silk, or cotton, and fastening round the middle by a running string—a very short chemise of gauze, reaching only to the waist—a koortnee or jacket reaching to the hips having open sleeves, which may be buttoned close if required—an arackcheen or small skull-cap upon the head, and sometimes a charkud or handkerchief thrown over the head and descending on the shoulders and back. In full dress a mahomedan lady wears the peshwaz or Persian robe, in which dancing women usually perform. It has long tight sleeves, a tight body crossed in front, and a very voluminous muslin skirt, the most fashionable amplitude being about forty, or even sixty yards in circumference. This garment is often trimmed in a costly manner with gold or silver lace, and is only worn as a bridal dress or at domestic festivals. The Persian ladies regard the bath, as the place of their greatest amusement. They make appointments to meet there; and often pass seven or eight hours together in the carpeted saloon, telling stories, relating anecdotes, sharing their kalions, and completing their beautiful forms into all the fancied perfections of the east; dyeing their hair and eye-brows, and curiously staining their fair bodies with a variety of fantastic devices, not unfrequently with the figures of trees, birds and beasts, sun, moon, and stars. This sort of pencil-work spreads over the bosom, and continues down as low as the navel, round which some radiated figure is generally painted.

The usual riding costume of a Persian gentleman, consists of a black lambskin cap, pinched into a conical shape, which is worn alike by prince and peasant. The material is brought from the country about the Oxus, and varies much in quality and value. An open shawl surcoat, lined with fur, reaches about

half way down the thigh, the sleeves are cut off a little below the elbow. These surcoats seldom cost less than 25*l.*, often much more. Under this a light gown is worn, reaching nearly to the ankle, and open on the sides for about a foot from the bottom. These gowns, likewise an universal dress, have slits left open under the arms and inside the elbows. A shawl is tied round the waist, and supports a long dagger with a handle of ivory or bone, sometimes ornamented with jewels. In cities, the surcoat is usually laid aside, and in winter a cloak of cloth is substituted. On horseback a pair of roomy Hessian boots, of black or red leather, are drawn over the voluminous "shal-nar" or "Cossack" trowsers.

The custom of approaching superiors with presents has been the habit of the countries of Asia from the most ancient ages. It is indeed the fee which barbarous despotism exacts from petty rulers and governors under their authority. The natives of Persia do not recline on cushions in the luxurious manner of the Turks, but sit in an erect posture on a thick felt, called a numud. They have seldom or ever fires in their apartments, even in the coldest season; and, in order to be warm, fold themselves in a fur pelisse, or a barounce, which is a handsome robe of crimson cloth, lined with shawls or velvet. Like other oriental nations, they rise with the sun; and having dressed and said their prayers, take a cup of coffee, or perhaps some fruit.

The natives of Persia are enthusiastically devoted to poetry; the meanest artisan of the principal cities of that kingdom can read or repeat some of the finest passages from their most admired writers, and even the rude and unlettered soldier leaves his tent, to listen with rapture to the strain of the minstrel who sings a mystic song of divine love, or recites the tale of a battle of his forefathers. The very essence of Soffeicism is poetry. The following is a list of poets in their true or their takalloos names who have written in the Persian language.

Many of the tales and stories current throughout Central Europe, came to it through the

Persian. Professor Max Muller in a lecture on the "Migration of Fables;" traced the history of some familiar examples of this class of literature, until their source was lost in the mists of Indian antiquity. The familiar adage, "Count not your chickens before they are hatched," many would refer to Lafontaine, and to his milkmaid, Perrette. But about the year 550 of the Christian era, it was told to Khosru Nushirvan, king of Persia, that there existed in India books of great worth and wisdom, capable of instructing mankind in matters important to their welfare. The king desired that his own subjects should share in the benefits to be obtained from these books, and he instructed his vizier to employ a proper person to obtain and translate them. The Royal physician, Barzuyeh, was selected for the work and succeeded in accomplishing it. Barzuyeh refused all reward beyond a dress of honour, but stipulated that a notice of his own life and opinions, probably written by himself, should be appended to the work. Of this notice Professor Max Muller said that it was a *Religio Medici* of the sixth century, and that it exhibited the thoughts of a man who turned away from formalities in search of truth, and who, like many such seekers before and since, found his best refuge from the uncertainties of life in his endeavours to alleviate the sufferings of his fellow men. Among the Indian writings thus translated was a collection of fables known as the *Pancha Tantra*, or five books; and they were rendered into Pehlevi, the ancient language of Persia. The original version by Barzuyeh is lost, but between the years 754 and 775 it was translated from Pehlevi into Arabic by Abdallah ibn Almo kaffa, who held high office at the Court of Almansur, khalif of Bagdad, the contemporary of Justinian. This second rendering of the *Pancha Tantra* has been preserved, and an edition of it was published by de Sacy in 1816. It contains among other fables the story of a brahmin, who collected rice by begging, and put the surplus into a pot, which he suspended over his couch. It occurred to him that there might be a famine, in which case he would sell his rice for a hundred rupees, and would buy two goats. The goats would multiply and become a herd, and he would sell them and buy cows. The cows would calve, and increase in value, and he would then buy buffaloes and cultivate land. With the produce he would buy mares, and would sell their foals for gold, with which he would buy a fine house. Then a brahmin would bring him his daughter in marriage, with a rich dowry, and they would have a son, who should be called Somo Sala, and should run to sit upon his father's knee. The child should so run when his father was sitting reading, and would be in danger of

being kicked by one of the mares. The father would call out to his wife, "Take the baby! Take the baby!" but she, intent on household cares, would neglect the call. Then her enraged husband would spring up and give her a violent kick, and the brahmin kicked out so vigorously that he kicked his pot and broke it, and the rice ran out and made him white all over, so that people said of those who formed foolish plans that they should be made white, like the father of Somo Sala. This fable in its course towards modern times, has undergone modifications. In one of these the dreamer was a holy man who had collected butter and honey, and the immediate cause of the final catastrophe, the breakage of the jar, so that the butter and honey ran down upon his beard, was the flourish given to his stick as an expression of his determination to chastise the son who was to crown his prosperity, if that son proved a negligent or backward student, and failed to profit by the masters that would be obtained for him. The version of Abdallah ibn al-Mokaffa was itself translated into Greek by Symon Seth, and from his Greek into Italian and Latin. It was also translated, directly or indirectly, into Hebrew, Latin, German, Spanish, French and English, but the version from which Lafontaine appears to have taken some of his stories came through two successive Persian translations, of which the second, a modernized one, was long a Haileybury textbook, and which appeared in French as the fables of the Indian sage Bed-pai or Pilpay. Lafontaine did not obtain Perette from this source, as the original fable was not included in the collection. Sergius, a Christian, held a position of trust under Al-Mansur, and his son, under the name of Johannes Damascenus, became a famous theologian and controversial writer. Among other works, he wrote a treatise on Christian morals, in the form of a kind of religious novel, the history of Balaam and Josaphat. The latter was a young Prince, of whom it had been predicted that he would embrace Christianity, and become a devotee. His father endeavoured to seclude him from all knowledge of human misery or evil, and to attach him entirely to the pursuit of pleasure. But at length the young Prince took three drives, and saw old age, sickness, and death. He became a hermit, and had been accepted as an actual person by both the eastern and western Churches and was canonized by both. In the Greek Church the festival of St. Josaphat is celebrated on the 16th of August; in the Church of Rome on the 27th of November. But the son of a great officer at the Court of Al-Mansur would certainly be acquainted with the Indian literature that Abdallah ibn al-Mokaffa had translated from Pehlevi into Arabic;

and the history of Josaphat is simply the history of Budd'ha, as given in the sacred books of the buddhist religion. It is strange, indeed, that the founder of buddhism, a religion that had endured for 2,400 years, that even now numbered 455,000,000 adherents, and that taught a morality second only to that of Christianity, has received the highest honour that the Church of Rome can bestow; yet no member of that Church who reads the life of Budd'ha need feel ashamed that this heathen saint had been added to the calendar.

When the Greek historian Procopius wrote, (early in the sixth century of our era), the Persians appear to have scrupulously abstained from concealing human bodies by interment, leaving them all for dogs, and birds of prey. Agathias, another historian and not many years later, says that human bodies were universally consigned to birds and beasts by the Persians, who deemed it unlawful to conceal the dead, either underground, or in a case or cover of any description. Yet that sepulchral urns were occasionally used among them, is affirmed by Mir Yahia, in a passage which D'Hierbelot, seems to have amplified, according to his French translation; and of which Gaulmin's latin version does not perfectly correspond to the original text, at least as it appears in two copies of the Lubb-ut-Towarikh; manuscripts not particularly inaccurate. These having mentioned the sculptures and royal tombs in the mountain of Istakhr, inform us that "the graves or sepulchres of those Persian kings who existed before mahomedanism were of three kinds; some bodies being deposited in natural caves, or dakhmahs contrived in mountains; others between rising grounds, in vallies which were afterwards filled with such a quantity of stones, as to become a general level, (or, as one copy expresses it, until they formed a pile or heap,) and some having been put into urns or jars, were preserved in the ground." This author, merely describes in this passage, the different modes of royal sepulture. In the present day, unless a death happen to take place during the night, the funeral follows immediately after it. The body is washed with rose-water; then, being wrapped in a white sheet and cotton shroud, it is carried on a bier to the grave, where the priest, having read some passages from the Koran, throws earth on the body as it is finally deposited in the ground. No coffin is provided, and the corpse is placed on its right side, with its face towards the west. If the deceased be rich, a funeral feast is kept for several days after the ceremony, and alms are distributed at particular intervals. But when a person of rank dies, it is not unusual for the king to command the body to be conveyed to Meshid-Ali, or one of the other places

of Shiah pilgrimage; followed by his charger bearing the arms, clothes, &c., of the deceased, and also by numerous led horses, with the badges, ensigns, and other expensive insignia of funeral state.

The great caravan lines are in five directions. The first passes westward from Central Persia towards Bagdad, Mesopotamia, Syria and Asia Minor. The second runs northward through Erz Rum, and into Europe by the way of Constantinople. The third goes also to Europe by Tiflis. The fourth runs eastward to Bokhara and China. And finally, a fifth proceeds to India by two distinct lines, which unite at Herat. One of these routes comes to this town from Irak, and the south-western provinces of the kingdom, through Shirak; and the other from the north-west, by Teheran, Nishapur and Mashed. Eastward of Herat, however, the united lines pass through Kandahar, Kabul, and Jellalabad, to Attock, from whence it branches out to different parts of India. The trade through Recht, Balfroosh, and other ports on the shores of the Caspian, amounts to nearly 400,000*l*. The purchases made by Persians with cash at Constantinople during the year 1840 and 1841, amounted to 570,000*l*. each. As the port of Abu-Shehr sends to India, goods to the value of 400,000*l*., exclusive of the trade from Mohammarah; if to these be added the caravan trade to Aleppo and Bagdad, there will be an export trade amounting to about two millions. Therefore, as something like a balance must prevail, the commerce of the modern provinces can scarcely be much short of four millions annually.

The modern tongue of Persia is derived from Zend, as Italian was derived from Latin, but the Persians now speak a language which is neither Semitic, like Arabic, nor Turanian, like Turkish; it is a branch of the Indo-European or Aryan family of speech. A large infusion of Persian words however found its way into Arabic, and through Arabic into Turkish, and the result is that at the present moment the Turkish language, as spoken by the higher ranks at Constantinople, is so entirely overgrown with Persian and Arabic words, that an uneducated Turk from the country understands but little of the so-called Osmanli, though its grammar is exactly the same as the grammar which he uses in his Tartaric utterance. The Persian language is met with all over Affghanistan and British India, the great Affghan families speak it, and in India correspondence of mahomedans is carried on in that tongue: the Affghan people are acquainted with it, but they prefer speaking the Pushto, the language of their nation, which is a mixture of ancient Persian, Arabic and Hindoostani. The Affghans have a few works in this language,

but they read Persian authors by preference, and have through them formed imperfect ideas of geography, astronomy, medicine and history; these works, full of fictions and deficiencies, have not materially assisted in developing their faculties. Throughout British India, the written language of the educated mahomedan is the Persian. The Persian language is spoken in Erivan and a great part of Aderjiban, Shirvan and Daghestan north of Caucasus. Throughout Persia the inhabitants of towns all speak the Persian language. The tribes to the west of India, especially those of Khorassan, understand Persian generally, and their dress, arms and habitations, while they retain their national peculiarities, approach to those of Persia. The character of the people, however, is essentially different from that of the Persians. Persia possesses few mines of the precious metals; nearly all the gold and silver in the country being imported. There are, however, great quantities of copper, lead and iron; and if these mines were properly worked, the profits would be very great.

Persian weights are:—

Nokhood a kind of a vetch called in India “Bengal gram.”

24 nokhood = 1 miscal, about one-sixth of an ounce.

90 miscals = 1 vakka, nearly a pound avoirdupois.

8 vakkas or 720 miscals = one man of Tabreez.

In different places varying from 7 to 7½ pounds.

2 Tabreez man = 1 kharwar or ass-load, 725 pounds.

The exhaustive system of agriculture which characterizes Persia, and which, with advantages hardly equalled, certainly not surpassed, by any Oriental country, still keeps her impoverished and consequently warlike along her frontier line, and readily accounts for the attempts of Persia to subjugate the mountainous region, interspersed by fertile valleys, which forms her eastern boundary, from which arises the permanent feeling of irritation that prevails among the hill tribes all along the N. W. of British India.—*Ouseley's Travels*, Vol. i, p. 220; *Lecture by Professor Max Müller at the Royal Institution, quoted in London Times*; *Treaties, Engagements and Sumnuds*, Vol. vii, pp. 88-91 and 97-99; *Ed. PERSIAN. A silken fabric of various colours, and exceedingly flimsy in its texture. It is chiefly used in lining.—*Paulkner*.

PERSIAN BERRIES. Great quantity of yellow berries are annually shipped from Constantinople; 115 tons were imported into Liverpool in 1853. The average annual imports into the United Kingdom are about 150 tons. They come from the Levant in hair bales weighing three and a quarter cwt., or in tierces of four to five cwt., and are used by calico printers for dyeing a yellow colour.

PERSIAN CAT. Recently, a cat merchant in New York sent for a cargo of cats to the island of Malta. On the return voyage a violent storm sprung up, and an old sailor swore that the cats were all devils, and would send the schooner and all to Davy Jones's locker. This was enough for the superstitious crew; and the cats were immediately demanded of the Captain, given up, and drowned. By a coincidence, the storm abated. The owner of the cats sued the owners of the vessel for damages, laying the value of the cats at 50 dollars a piece. The long silky-furred Angora cats are annually brought to India for sale from Affghanistan, with caravans of camels even so far as Calcutta. These animals are currently known as ‘Persian cats;’ but as Mounstuart Elphinstone remarks, “the long-haired variety of cats, called burak, are exported in great numbers from Affghanistan, but are not numerous in Persia, whence seldom or never exported.” Again, Lieut. Irwin notices that “they are bred in Kabul and some parts of Turkistan. By us,” he remarks, “it is very improperly called ‘Persian;’ for very few are found in Persia and not any exported. The Kabulies call this cat baruk or burak, and they encourage the growth of its long hair by washing it with soap and combing it.”

PERSIAN FLEA POWDER, the Poudre mismeque, is sold in Paris, in boxes for destroying immediately, bugs, fleas, ants, lice, black beetles, caterpillars and all insects, “Camomille rouge” the beautiful red Pyrethrum (*P. carneum*, formerly *chrysanthemum coccineum*), in England a pretty garden,

ornamental flower, is a dread enemy to the Caucasian, Persian, Koordish and Russian fleas. It is prepared from the flower heads of the plant which, when dried and crushed, form the famous Persian flea powder. When used by being sprinkled in beds, &c., it kills all disagreeable and hurtful insects, and a small quantity of the spirit distilled from it, destroys insects in green houses, or can be applied to vegetable life in the open air against green fly, house fly, &c., without injuring the plants. A half tea-spoonful of the powder sprinkled between the sheets will effectually dispel all fleas, bugs and lice, gnats and mosquitoes and it is said also to destroy maggots which breed in wounds, a property which the valuable Deca-mullee gum of India, the gum of the *Gardenia lucida*, and chloroform, also possess. More than twenty villages in the district of Alexandropol are occupied in the cultivation of the red chamomile, and thirty-five tons of this flea powder are manufactured annually for Russian use, in Trans-Caucasia alone, being equal to about 40,000 kilos of powder from 80 millions of pounds weight of fresh flowers. The red *Pyrethrum* is now largely cultivated in various circles and governments of southern Russia. The flower heads lose vastly in weight by drying, and to get one pound of dried flowers, 1,000 lbs. of the fresh are required. It begins to flower in June and lasts more than a month. The flowers are plucked in dry weather, and a good collector will pluck 30 to 80 lbs. daily. They should be dried in the shade and care taken to stir them frequently. The *Pyrethrum* powder, seems the same as the well known *Pircoti* of Koordistan, and was greatly used in the barracks and hospitals of Turkey and the Crimea, by the British and French officers: it accomplishes very effectually the destruction of fleas, &c. Mr. H. H. Calvert, considered the plant might be a *Pulicaria*, a *Matricaria* or *Anthemis*; but, that the *Pircoti* is the powder of the half ripe flower heads of *Pyrethrum carneum*, there now seems no doubt. The *Pyrethrum carneum*, does not grow in India, but its introduction merits favourable consideration. The property it possesses, of dispersing the vermin which infest beds and bed-rooms, probably depends on the pungent oil it contains; but until its introduction into India, attention might be directed to other species of *Pyrethrum* and to the allied genus of *Chrysanthemum*, or Christmas flower, as likely to contain an oil with properties similar to the flea-bane. Mr. Mason mentions two species of *Pyrethrum*, *P. indicum*, and *P. sinense*, as growing in the Tenasserim provinces. The odour of the common fever few, of Britain, *P. parthenium*, is peculiarly disagreeable to bees, and these insects may be easily kept at a distance by a

person carrying a handful of the flower heads: perhaps, also, the "*akarakarum*" of India, the *Pyrethrum officinale* or common pellitory, may have equal power.

PERSIAN GULF. Those portions of the coasts of the Persian gulf which are not occupied by tribes having treaty relations with the British government are either under the dominion of Turkey or Persia. The Turkish suzerainty is acknowledged on the southern shore from the Shat-el-Arab to a point nearly opposite Demam, a small portion nearest the Shat-el-Arab being directly under the pasha of Baghdad, and the rest being occupied by Arab chiefs, who acknowledge dependence on the Turkish government. The northern shore nearest the Shat-el-Arab is held by Arab chiefs owing allegiance to Persia, and the coast eastward to a point nearly opposite to the western extremity of the island of Kishm is governed directly by officers of the shah of Persia. The western shore extends nearly 1,495 miles, viz., from the estuary of the Euphrates to the entrance at Ras-el-Hadd, in which space are the bold headlands of Ras Matrah near Mankat, and Ras Mussendom, or the Cape of the Mill, which forms one side of the entrance, and is only 28 miles from the opposite coast of Kirman. Here this rocky coast changes its direction, running south-westward to Abothub-bee, then westward to Ras Macheereeb. It now trends northward to Ras Reccan, which forms one horn of the deep bay of Bahrein; along this it makes a western curve, and then trends N. W. to the Shat-el-Arab; previously forming the three remarkable bays of Abothub-bee, Katif, and Kouweit or Grane. The first contains a swarm of hardy boatmen occupied alternately in pearl-fishing and piracy; the second is remarkable for its pearl-fishery; and the last as a commercial port at the entrance of the Euphrates, with a trade up that river, and also eastward to Cutch and the adjacent coast, the vessels making an annual voyage each way. From different places in the Persian Gulf, upwards of 1,000 bagalas, varying in size from 40 to 300 tons, depart towards the close of the favourable monsoon, in order to be able to return thither after the change: they bring ivory, aloes, canes for spear-handles, dragon's blood, gums, gold dust and timber, which are obtained after selling, or more generally bartering their cargoes; these last consist of coffee, spices, horses, dates, and occasionally pearls. The last form, however, a distinct branch of trade, and though less valuable now than formerly, in 1836, it produced more than thirty lacs of rupees, or upwards of 300,000*l.*, which probably is a fair average of the yearly value. Lieutenant Wellsted says 40 lacs annually, or about 400,000*l.* Respecting

the object that Solomon had in view, when he took possession of Palmyra, Volney entertained the belief that he wished to use it as an emporium of the East India trade, by way of the Persian gulf, and the course of the Euphrates. This was about B. C. 1000. Most of the ancient traffic with India seems to have been by way of the Persian Gulf and the Red Sea. The Tyrians established depôts on the shores of the Persian Gulf, and the course of trade being through the land of the Cushdi, the races in India came to be included under the ethnological title of Cush, (Gen. x, 6), and hence the Persian, Chaldean and Arabic version frequently render that term by India, Is. xi, 2, xviii, 1; Jer. xiii, 23. By the natives, however, Hindustan, is a term applied to the whole of that central region of northern India, from the Punjab on one side to Bengal on the other, and from the Himalaya to the southern declivities of the Satpura range running across India in about the parallel of L. 22 N. The Hebrew name of the upper part of the Red Sea was the Sea of Sedge. After the time of Solomon, however, the knowledge of the southern seas seems to have become defective in the south of Europe. In a communication to the Royal Geographical Society, Captain Burton gave his reasons for believing that the Greeks borrowed their Erythrean Sea from the Arabic Sea of Himyar, which seems to have been some part of India. The Erythrean Sea was a name (*Pliny* vi, *lib. cap.* xxii and xxiv,) applied to the Indian Ocean as well as to the two gulfs, the Red Sea, and Persian Gulf, which it forms on each side of Arabia. Herodotus does not particularly distinguish the Persian Gulf, but includes the Arabian Sea and part of the Indian Ocean, under the general name of Red or Erythrean Sea. And *Pliny* styles the Persian Gulf "a bay of the Red Sea." Greek and Roman authors, however, generally used the term "Persian Gulf," but it appears also among them as the Babylonian Sea, and the Erythrean Sea, and this has caused a confusion with the "Red Sea." The Persian Gulf, by many is described as the "Green Sea" also in Eastern manuscripts as the Sea of Fars or Pars, the Sea of Oman, the Sea of Kirman, Sea of Katis, Sea of Basrah; deriving these and other names from the adjoining provinces and from remarkable places on its Arabian and Persian shores. There are but two winds which prevail in the Persian Gulf, the north-west and south-east, and when the latter sets in, the whole force of the sea is brought to bear directly against the current of the Euphrates, and hence an enormous deposit is effected of the aluvium brought down by the stream, thus barring up its mouth. This deposit, constantly on the increase, progresses, according, to Sir Henry Rawlinson, at

the rate of a mile in the lapse of thirty-five to forty years. A great city, of which the ruins are to be seen above Mahammerah, was an island in the time of Sennacherib, named Billat, and can be shown to have been still an island in the time of Alexander. At the present time it is sixty miles from the mouth of the river, and a succession of cities can be traced upon the desiccated delta below it, along the river, down to the sea.—*Ait. Treat. Eng. and Sunn. Eng.*, Vol. iv, p. 199; *Travels in Oman*, Vol. i, p. 265; *Euphrates and Tigris*, Col. Chesney, Vol. i, p. 568; *Rennell's Memoir*, p. xxxiv. PERSIS PROPER, see Fars.

PERSOONIA. The Dele, the Embotherium, the Hakca, Banksia, and Persoonia, are interesting plants introduced from the Cape and New South Wales, the species being chiefly confined to the southern hemisphere. They are handsome green shrubs, and prized by gardeners for the neatness of their appearance and beauty.—*Riddell*.

PERSULPHURET OF ARSENIC. See Arsenic; Hortal.

PERTABGURH DEOLAH, a small principality grown out of Mewar, the rajah being descended from a junior branch of the Oudeypore house. From the time of the establishment of the Mahratta power in Malwa the rajah of Pertabgurh paid tribute to Holkar. Under the 4th article of the treaty of Mundisore, the British government acquired a right to the tribute levied by Holkar in Pertabgurh. Rajah Dulpot Sing succeeded to the state in 1844. Dulpot Sing was grandson of the chief of Pertabgurh, and had succeeded to the state of Doongurpore on the deposition of Juswunt Sing, by whom he had been adopted. On his succession to Pertabgurh he relinquished Doongurpore to Oodey Sing, son of the Thakoor of Sablee. He was guaranteed the right of adoption. The area of the state is 1,460 square miles, the population 150,000; the revenue, after deducting the tribute paid to the British government and about two lakhs of rupees enjoyed by feudatories of the state, is in British money about rupees 2,62,400. No local corps or contingents are maintained at the expense of this state. The chief receives a salute of

fifteen guns.—*Tod's Rajasthan*, Vol. ii, p. 76; *Treaties, Engagements and Sunnuds*, Vol. iv, pp. 187-88.

PESHATT. Numbers of gold-washers are constantly employed near Peshatt on the river of Chitral and Kameh. The metal is also found in the rivers of Lughman, and in the river of Cabul, into which they fall, and is sometimes collected near Kergah and Char Bagh of Lughman, and again near Jellalabad. On the joint river of the Kohistan of Kabul before it enters the Safi hills, there is a spot preserving the name of Zar-shu, that is to say gold-washing, though now unfrequented, and it is certain that all, or nearly all the rivers flowing from the north have auriferous sands, as quantities of the metal are procured in the Yusufzai districts. It may be worthy of note, that the people who search for the gold are not of these countries, but of the Panjab; many are natives of Jelam, on the river of that name. It is not improbable that the rivers of Kaftristan, when increased in volume, may pass over soils enriched with gold and carry down the precious particles with them. See Kabul.

PESHAWAR, a town of 80,000 inhabitants, in lat. 34° 9' 30" N. The brothers Schlagentweit say lat. 34° 3' 2" N., and long. 71° 33' 3" E. Peshawar lies between the Indus above and below Attock, and the Khyber mountains, through which leads the Khyber pass; being bounded on the north by Swat, and the region lying between it and the Indus, on the east, by part of the last mentioned territory the Indus and the territory of the Affghans holding the Salt or Ilala range; on the south by the possessions of the same Affghans, and, on the west, by the Khyber mountains and the Affghans province of Jellalabad. Its climate is very hot in summer, the thermometer frequently reaching 110° or 112° in the shade. The heat is, however, occasionally mitigated by the breeze from the neighbouring mountains and as the country, naturally fertile, is well-watered by the Indus, the Cabul river, the Bara and some other streams of less importance, and is moreover, well cultivated, it is amazingly productive. In annexing all the Sikh states, Jummoor excepted, as well as Peshawur and the Derajat between the river and the mountains, the British frontier was advanced beyond the Indus, adding thereby, 100,000 square miles to British territory, with a population of three and a half millions, yielding a revenue of about a million sterling, and giving promise of containing great mineral wealth.

The far-famed and beautiful Peshawur valley, in the extreme corner of the empire, is encircled on three sides by the Khyber, Momund, Swat and Khuttuk hills, and is on the fourth side open to the Indus. It is watered by the Cabul river and its tributaries, the chief of which are the Swat river and the Bara. Its total area is about 2,400 square miles. It is intersected by the great road, through which the invaders of India have always passed. Peshawur Proper is divided into two portions, one lying on the right bank of the Cabul river, and adjoining the Khuttuk and Afreedec hills, which run down to a point at Attock, the other a triangular-shaped tract, of which the two sides are marked out by the Cabul river and one of its tributaries the Bara, and the base by the Khyber hills. This is the most highly cultivated spot in the whole valley; in the heart of it, stands the city. The inhabitants of Peshawur Proper belong to mixed races of no political importance. They are industrious and peaceful, and long accustomed to bear up against the oppression of harsh masters and fierce neighbours. About Peshawur, lie the Mahmudzye, Dawudzye in Hastnuggur, Momund, Guggiani in Hastnuggur and the Khalil.

Peshawur district.—Eusufzye, Khaleel, Momund of the plains.

Peshawur and Kohat districts.—Khuttuk.

Adjoining frontier of Peshawur districts.—Judoon, Bunoorwall, Swatee, Raneczye, Osmankheylee, Upper Momund.

Adjoining frontier of Peshawur and Kohat districts.—Afreedec. Thus, Peshawur and the hills which surround it, are peopled by various Affghan races, as Eusufzye and Momund in the north and west, Khaleel and others in the centre, and Afreedec, Khuttuk and others in the south. The Eusufzyes claim political importance. As soldiers, they are not inferior to any of the independent tribes. They are the most martial of all the British subjects on the frontier, and the history of many generations attests their military exploits. Participators in every war that has convulsed the Peshawur valley, and always the recusant subjects of the Sikhs they literally turned their swords into plough-shares and became right good lieges of the British. Their customs have been respected, the allowances of the chief and their village headmen have been confirmed. Though constantly tampered with by the Swat government to rebel, they only once yielded to temptation, just after annexation in 1849. The Momunds are a large tribe occupying the hilly country on the north-west border of the Peshawur valley, adjoining Bajour and Koonur to the north, and the district of Ningrehar to the west, the southern boundary being formed by the Cabul river. They own allegiance to the ameer of

Cabul, from whom their chiefs receive cash allowances, and the revenue of certain districts in the direction of Jellalabad, amounting to about Rupees 60,000 per annum. The tribe numbers 17,000 men, and is divided into six clans. Owing to the direct influence exercised by the ameer of Cabul over the Momunds, it was chiefly through this tribe that he endeavoured after the annexation of the Punjab, to harass the British border. Three of the clans border on the British districts, the Turrukzai, Haleemzai and Pindiali Momunds, and all three were in the enjoyment of certain villages within the Peshawur district, of the collective value of Rupees 10,000 per annum, and thus owned allegiance to the British government and the ameer. In 1850 and 1851 their raids and robberies were frequent. Lord Clyde proceeded against them in October 1851, but scarcely had his force been withdrawn, when, in April 1852 the tribe determined to make another combined effort. They were attacked and completely routed by Sir Colin Campbell, and from that day the tribe never appeared against us in a body, and left the three clans on our border to make their own arrangements. The Haleemzai at once tendered their submission. The Turrukzai Momunds after a few years, and being defeated by General Cotton were wholly subdued, and in 1860, the Pindiali clan submitted unconditionally.

Ranezai.—The troops were still in the field after the defeat of the Momunds, when intelligence was received by a bold act of atrocity in another part of the district. The large village of Tunzi, on the Swat river, was the residence of a powerful chief named Ajoon Khan, a young man of a restless, proud, and bigotted character. A large part of the village was held by him rent-free, but he desired the whole of it, and exemption from personal attendance at British courts, and from the interference of British revenue and police officials in his village. For the signal chastisement of these tribes a force of 5,000 men was collected near Tungi, on the Swat river, and Sir Colin Campbell proceeded in May against the Otmankhail, who number 3,000 matchlocks. They offered considerable resistance, but they were finally driven from their strongholds with much loss, and their chief villages of Pranghar and Nawadum were completely destroyed. The force passed on into Ranezai and captured the leading men of the tribe. No agreement was entered into at that time with the Otmankhail, but their defeat at Pranghar convinced them of their inability to cope with the British. The Ranezai chiefs shortly afterwards, submitted, and wished to become British subjects. This was not acceded to, but they were allowed by Colonel Mackeson, then Commissioner of Peshawur, to re-settle

on terms to which they have since steadfastly adhered. At the same time a fort was constructed at Abozai, on the Swat river, to check these tribes. The result of the expedition was to restore order and security to the Hushnugur district, and to put a stop to the flight of chiefs and mulliks.

Hussun Khail and Ashu Khail.—The Kohat and the Jowakih pass, are two principal passes leading from Peshawur to Kohat. The latter is occupied by the Jowakih clan of Afreedi but in the hills leading to it are the Hussun Khail villages of Janakhir and Kooce. Between these two passes the hills are occupied by the Ashu Khail. All the above are sub-divisions of the Adam Khail tribe. The Jowakih village of Boree had, throughout the Sikh rule, been notorious as the residence of free-booters, who plundered in the Attok road. During the investigation which ensued, it appeared that the Hussun Khail and Ashu Khail were powerless against the Jowakih clan, but in the presence of the British force they were enabled to separate themselves, and entered into an agreement on their own parts on the 15th November 1853. The Hussun Khail number 900 matchlocks, and the Ashu Khail 800. They have faithfully adhered to their engagements since.

Jowakih of Boree.—The force then proceeded to attack the Jowakih in their stronghold of Boree. The operations were difficult, and, owing to the nature of the ground, our loss was severe; but the village and all its towers were destroyed, and the Jowakih were driven from all the positions which they had occupied. The destruction of Boree had the desired effect, and in two months the chief submitted, and entered into an agreement on the 14th January 1854, engaging to abstain from raids themselves, and to eject within two months all the fugitive freebooters with them. These engagements have been strictly fulfilled by them. The Jowakih number 1,000 matchlocks. Subsequently to these proceedings Fort Mackeson was constructed in the plain between the two passes, and the police post of Shumsuttoo to command the entrance to the Jowakih pass, with patrolling roads and connecting towers.

Kohat Pass Afredee.—This pass is occupied by the Gulla section of the Adam Khail tribe of Afredee, except the village of Akhar, at the Peshawur entrance, which belongs to the Hussun Khail section of the same tribe. They number 1,200 matchlocks. The defile extends from near Eymul Chabootra, in the Peshawur plain, for a distance of about 12 miles. The road then winds over a mountain, the crest of which forms the boundary between the Gulla Afreedees and the Bungush who occupy the Kohat valley. From this crest to Kohat is a

distance of about 7 miles, the greater part of which is a descent through mountain gorges unoccupied by any tribe. Soon after annexation, the Afredee of this pass began to be troublesome, and were incited to lawless acts by emissaries of the Cabul government. At the close of 1853, the continued misconduct of the Afreedees necessitated a change on the 1st December 1853, th an agreement, to maintain the pass on the old terms, from Eymul Chabootra on the Peshawur side to the foot of the mountain. They also relinquished Rupees 300 of the allowance to the Mulliks in favour of the Bussi Khail, a clan occupying the hills close to the entrance of the pass.

Bezotee and Feroz Khail.—The Bungush having failed to make good their position against the Afredee, called to their aid certain neighbouring tribes, to whom they assigned portions of the allowance, retaining for themselves Rupees 3,000. Of these tribes the Feroz Khail and Bezotee clans of the Orukzai were the chief. One tower on the crest was assigned to them, and they were to receive Rupees 2,000. They number 1,500 men.

Jowakih Afredee.—The Jowakih Afredee, who number 1,100 men, also received Rupees 2,000 for the maintenance of another tower on the crest. The agreement with them is dated 3rd December 1853. A similar agreement, was made with the Sipah tribe of Orukzai, who number 300 men. A third tower was assigned to them, and an allowance of Rupees 500. Bahadur Shere Khan, the Bungush chief, was placed in charge of the whole of the pass arrangements on Rupees 14,400 per annum. It will thus be seen that the entire cost of the pass is as follows:—

Gulla Afreedees.....	Rs. 5,400
Bussi Khail.....	300
Bezotee & Feroze Khail..	2,000
Jowakih Afreedees.....	2,000
Sipah.....	500
Bungushes.....	3,000
Bahadur Shere Khan....	1,200

Rabiah Khail tribe occupies the hills north of Hungoo, in the Kohat district, and numbers about 600 men. They are a clan of the powerful Orukzai tribe.

Aka Khail is a large Afredee tribe, numbering 1,500 men, whose summer residence is in the Tecrah mountains, but they migrate in the winter to the hills bordering on the Peshawur district, between the Kohat pass and the Bara river, where they dwell in caves, grazing their cattle in the plain.

Kookee Khail is one of the principal tribes of the Khyber numbering 6,000 men. They occupy the pass of that name as far as Ali Musjid, and received a cash allowance from the

Ameer of Cabul Dost Mahomed, to whom they own a nominal allegiance.

Otman Khail.—The Kohat district is closely surrounded by independent tribes, more or less connected with those inhabiting British districts. Special agreements have been made with the following:

i.—The *Otman Khail*, a clan of the *Orukzai* tribe, numbering 450 men.

ii.—The *Zymooslit*, who occupy the north-western hills of *Meeranzai*, and number about 5,000 men.

iii.—The *Shekhan*, another clan of the *Orukzai*, numbering 2,500 men.

iv.—The *Alisherzai*, who number 3,000 men.

v.—The *Aka Khail*, who number 500 men.

vi.—The *Ali Khail*, an *Orukzair* clan of 3,000 men north of *Hungoo*.

vii.—The *Mishtec*, north of *Ibrahimzai*, who number 3,000 men.

viii.—The *Mummoozai*, north of *Hungoo*, numbering 3,000 men.

Agreements with them have been made at different times, but are all of the same tenor, that with the *Otman Khail*, is dated 2nd August 1853.

Tribes in Rajoree.—North of the *Bara* river, on the *Peshawur* border, is a tract of hilly country known as "*Rajoree*." It is occupied in the winter by parties of the *Sipah*, *Kummorai*, *Mullikdeen Khail*, and *Kumber Khail* tribes.

The *Jydoon* tribe is partly settled in the *Hazara* district, where they are British subjects, but a portion remained independent on the spurs and slopes of the *Mahabun* mountain, on the right bank of the *Indus*. Since annexation they have been peaceable and on friendly terms with us, but in their neighbourhood is the fanatic colony of *Sittana*, the members of which have been incessantly engaged in raids, robberies, and murders in British territory. In 1858 a force under Sir *Sydney Cotton* proceeded against *Sittana* and destroyed it. On that occasion the *Jydoon* remained quiet, and the *Otmanzai* were British allies. After some interval they agreed to pay a fine of Rupees 1,000, to close their country against the *Sittana* fanatics or other robbers, and to cease from levying certain oppressive dues from traders proceeding up and down the *Indus*. *Peshawar* town is 18 miles from the mouth of the *Khyber* Pass.—*Aitchison's Treatises, &c.*, pp. 393-397; *Malcolm's History of Persia*, Vols. i, pp. 5, 26, ii, p. 141; *Kinneir's Geographical Memoir*, pp. 19-20; *Prinsep by Thomas*, p. 301; *Porter's Travels*, Vol. i, p. 475; *Govt. of India Records*. See *Affghanistan*, *Khuttuk*, *Kohat*, *Khyber*, *Koh-i-safed*.

PESHING, see *Kelat*.

PESH-KABZ, *PERS.*, a kind of dagger.

PESHKAR, *Paishkar*, in *India*, a tributary officer or collector; a chief agent, assistant, or manager.—*Simmond's Dict.*

PESHKER, see *Mommai*.

PESH-KUSH, *PERS.* Tribute. In *Persia*, presents from inferior officers to superiors, something like the reliefs which in *Europe* during the middle ages vassals had to pay to their suzerain lords. A *Pesh-khidmut* is a servant constantly in attendance about the person of his master, particularly while he dresses and takes his meals: nearly answers to the *Khidmutgar* of *India*.—*Fraser's Journey into Khorassan*, p. 194.

PESHO, *HIND.* *Nima quassioides*.

PESHOLA, a lake in *Rajputanah*. The abode of *Sookhdeo* near the *Peshola* and *Oodisagar* lakes is in a deep recess, well-wooded, with a cascade bursting from the rock near its summit, under a ledge of which the symbolic representative is enshrined. Around it are several gop'has or caves of the anchorite devotees: but the most conspicuous object is a projecting ledge, named *Dyte-kahar*, or 'giant's-bone,' on which those who are in search of 'ease' jump from above. This is called the *Vira-j'hamp*, or 'warrior's-leap,' and is made in fulfilment of vows either for temporal or future good. Although most of the leapers perish, some instances of escape are recorded.—*Tod's Rajasthan*, Vol. ii, p. 628.

PESHTWA, a title given to the hereditary, ministers of the *rajahs* of *Satarah*. After the reign of *Sivaji II*, in 1749, they assumed the power of the sovereigns in the military government established by *Sivaji* the first in 1669. Their open power lasted from 1740, when *Balaji Bajee Rao*, succeeded his father and died after the battle of *Paniput*, until 1818, when the next *Bajee Rao* yielded to the British on the 3rd June and was pensioned. *Nana Farnavis*, *Karkun* of *Madhaji Rao Belal*, died November 1771. *Madhava Rao*, *peshwa*, died in November 1772, and was succeeded by *Narayan Rao* his younger brother. But nine months afterwards, his uncle *Ragonath Rao* or *Ragoba*, caused *Narayan Rao* to be assassinated and assumed the rule. He was, however, opposed by his council but he defeated their arms. *Ragoba's* cause was alternately supported and abandoned by the British. See *Mahratta*, *Sevaji*, *India*.

PESHWAZ, *HIND.*, of *Delhi* a female dress or skirt.

PESOLES also *Guisantes*, *sp.* *Pease*.

PESONIA MORINDIFOLIA, see *Vegetables* of *Southern India*.

PESALOO, *TEL.*

Haree moong, *HIND.* | *Pessaloo*, *TEL.*
Pucha pavaroo, *TAM.*

Phaseolus radiatus.

PESSANI, a district of Beloochistan near the sea, a maritime section of Beloochistan. See Kelat.

PETA, HIND. Silk thread or wool for weaving.

PETALA ULAR, MALAY. *Trichosanthes anguina*, Linn.

PETAN, SINGH. *Bauhinia tomentosa*, Linn.

PETARCURA, HIND. *Chaulmoogra odorata*.

PETARI, also Kungani, BENG., HIND. *Abutilon indicum*. G. Don.

PETROCINCLA CYANEA. The blue rock-thrush, the P. padoo of Colonel Sykes, is distributed over south-eastern Europe and the temperate and torrid parts of Asia. By some it is supposed to be the bird alluded to in Scripture, "the sparrow that sitteth alone upon the house-top." The difference in plumage between the sexes and young birds caused much confusion with the earlier Indian naturalists. Specimens likewise from the Himalayas have been found to have longer bills than individuals from other countries, and accordingly Mr. Blyth named the latter *P. longirostris*. This long billed variety is common among the rocks of the N. W. Himalayas; it would seem this is a permanent race of *Petrocincla cyanea*.

PETHA, HIND. *Benincasa cerifera*, a gourd used for making sweetmeats, also a sweetmeat, made of the *Benincasa cerifera* coated with sugar.

PETHA-KALABUNTIA, TAM. *Agave americana*; Pita.

PETHAL or Bethal of Chenab, &c., *Juniperus squamosa*, the creeping juniper.

PETHAMBARAM, silk cloth, chiefly brought from Benares and Nagpore: but also made at Combaconum. The Benares cloths are highly prized for the superior quality: they measure 12 by $2\frac{1}{2}$ cubits a piece, two pieces make one suit of an upper and under garment. Hindoos wear these cloths during their devotions and holiday time. They are sold from Rupees 50 to 350 or even more. The fabrics of Combaconum are good, although not equal to those of Benares.

PETHEN, HERB. An adder, Psalm lvii, 4; xci, 13; Deut. xxxii, 33; Job xx, 14, 16, the python snake. See Serpent.

PETHRA, HIND. of Kaghan, *Juniperus communis*, also *Juniperus squamosa*, the creeping juniper.

PETHURI or Pracha amavasya, takes its latter name from Prachi, eastern and amavasya, new moon. This hindoo festival is held on the new moon of the month Shravan in honour of the 64 yogini or female attendants of the goddess Durga. This is chiefly held by women who have lost infant children, but many hindoo men also engage in the holiday, purchase sweetmeats and toys. This day falls about the last days of August.

PETI, a belt or girdle.

PETINUR, BENG. *Panicum fluitans*.

PETIT-GRIS, FR. Calabar skins.

PETORAGARH, lat. $29^{\circ} 36' N.$; long. $80^{\circ} 11'$ in Kumaon, about 8 miles W. of the Kali. Its fort is 5,549 feet above the sea.—Webb.

PETREA. One of a genus of climbing plants with dark shining green leaves, and beautiful lilac or purple flowers hanging in racemes. It is a native of South America, and only requires to be regularly watered, and grown in a good garden soil, to cause it to extend itself over an immense space, its long slender whip-like shoots should be lopped down, to make it throw out branches, at the end of which the flowers appear in most elegant festoons towards the close of the cold season. It is easily propagated by layers.

PETREL, an ocean bird, see Procellaria.

PETRIFIED WOOD. Sir W. Johnston gave a notice of that of Ceylon, in London As. Trans., vol. i. That, at Treveccare, near Pondicherry, was noticed by Captain Warren in As. Res., vol. xi, 1, and Captain Newbold, in Lond. As. Trans., 1846. Captain McMurdo gave an account of that in Cutch in Bom. Lit. Trans. vol. ii, 110. For that on the Godavery, see Dr. Voisey's account, in Bl. As. Trans. and Dr. Malcolmson in London Geo. Trans., 1839, 566. Captain Vicary's account of that in Sind was given in Lond. Geo. Trans., 1845, vol. iii. Dr. Buist gave an account of a forest near Cairo in Bombay Times, August 1846. See also Captain Newbold's account of same in Lond. As. Trans., 1844, and Professor Orlebar's account of it in Bom. As. Trans., 1846. For that in the peninsula of Sinai, 4,500 feet above the sea, see Dr. Wilson's Lands of the Bible, vol. i, Petrified wood also occurs on the island of Perim, Gulf of Cambay. Dr. Nicholson's account of Bom. As. Trans., vol. 1. The Perim and Pondicherry wood is full of worm-holes and seems to have been in a state of extreme decay before petrification. It so abounds in the districts of Irawadi, as to be used for posts, outside of buildings. This has given rise to the notion which travellers have entertained that the posts they witnessed outside of the buddhist Kyoungs and Theins, consisted of wooden beams in process of petrification.—Dr. Buist's *Catal*; *Yule's Embassy*, p. 12.

Brought from Bussorah from the Sooloo island, from Burnah also found in Japan and Sumatra. Petroleum is officinal but little used by the

hakeems at Lahore, it is a product of the hills on the west side of the Indus, called Tukle reisar near Banu and Tank, procurable in the bazaar of Dhera Ismail Khan. It is of a reddish colour, and is lumped as spirit at Lahore. Petroleum, as its name indicates, is an oil-like exudation from rocks, which has been employed in medicine from the earliest times, though little used now. It is very abundantly diffused, and in other forms, as of asphalt, naphtha, &c. In Barbadoes and Trinidad, Petroleum is found floating on some springs of water in Britain as at Colebrooke Dale, &c., in many parts of Europe, also at Baku on the shores of the Caspian, and very abundantly at Ranangoong, or Earth-oil creek, on the banks of the Irrawady. Colonel Symes describes the wells as about 500 in number, and says upwards of 400,000 hogsheads are taken away in boats. It may readily be obtained by digging into the sand in warm weather. Drs. Christison and Gregory, who found in it paraffin, and lupion, which Reichenbach met with among the products of the destructive distillation of wood: whence they infer that Rangoon petroleum is the product of the destructive distillation of vegetable matter, probably from subterraneous causes now in operation. Petroleum has the consistence of treacle; reddish brown or black colour, with a bituminous taste; floats on water, in which it is insoluble; burns with a dense black smoke, leaving a carbonaceous residuum. Acids, alkalis, and rectified spirit have little effect on it; ether and both volatile and, fixed oils dissolve it. Exposed to the air, it hardens into asphalt: if exposed to heat, a yellowish coloured liquid distils over, which resembles the naphtha obtained in making coal-gas. Both are free from oxygen, and therefore used for preserving potassium and dissolving caoutchouc, has been recommended externally in rheumatism and in cutaneous affections; internally as a vermifuge. The Rangoon is probably as good, if not better, than other kinds. Petroleum was collected in an early survey of Cheduba, on the Arracan coast, and is found abundantly in the Burman empire. The town of Rai-nan-ghong, is the centre of a small district, in which there are some hundred petroleum wells, (more than five hundred, *Mason*) in full activity. The district in which they are situated consists of a sandy loam, resting upon alternate strata of sandstone and indurated clay: under these is a layer of pale blue, argillaceous schist, of considerable thickness, impregnated with petroleum: and resting upon coal. The petroleum flows into the well when it is sunk a few feet into the schist, and when it begins to fail the well is deepened. It is remarkable that no water ever penetrates into these wells. The annual quantity of petro-

leum produced by the district, exceeds 400,000 hhds. The uses of petroleum, where it abounds are very important. It serves the lower classes, instead of oil, for lamps, and mixed with earth or ashes, answers the purposes of fuel. A composition of petroleum and resin is an excellent material for covering wood work and for paying the bottoms of ships and boats, as it protects the timber from the attacks of worms and insects. When rectified by distillation, it affords naphtha.

Asphaltum or black Bitumen, (*Zift-roomi, Pers.*) is a deep black, pitch-like, solid; hard, softens at 150°, and melts above that; highly inflammable, believed to be the result of the natural distillation of petroleum. It is produced in abundance in Barbadoes and Mesopotamia. It is a valuable lacquer for the protection of iron or tinned iron vessels. A lump rubbed over the asphalt-heated metal coats it with a hard adhesive brilliant coat, which resists most of the common corrosive agents. The Petroleum wells in Burmah were described by Captain Cox in *As. Res.*, Vol. vi, p. 127. Springs of it occur near Hit, on the Euphrates, and were noticed by Dr. Winchester in *Bom. Geo. Trans.*, Vol. iii, p. 15. Vast abundance of it is found in the volcanic islands off Assam, of which Captain Halsted gave an account in *Bl. As. Trans.*, 1841. Capt. Hannay states, that the wells farmed by the Ava government, yield close upon 93,000 tons a year, worth £90,000 annually. The oil sells at about a shilling per cwt. Earth oil wells of Burmah occur near the town of Yen-an-gyoung (Fetid water rivulet), the town proclaiming the nature of its staple, to the smell and sight. One can smell the coal-tarry odour of petroleum everywhere; and piles of earthen pots to hold it, line the beach, while the outside skirts of the town abound in potters' kilns. In the view from the heights which surround the town, all, as far as the eye can reach, seems of a barren character: the soil sandy and stony with very scanty herbage, scarcely enough to redeem the surface from the title of absolute desert, with occasional scraggy bushes or grim euphorbias. Trees with substantial foliage were only seen in the bottoms, but even there no water was visible, or anything to indicate the season of the monsoon. Fossil wood abounded everywhere, and of a size to be used as the posts of temples. The road winds among ravines and at the steep sides of the rotten sandstone hills, till, about three miles from the town, you enter on the plateau, on which the principal wells are situated. It is an irregular table with a rising surface forming a sort of peninsula among the ravines. The wells are frequent along its upper surface and on the sides and spurs of the ravines which bound it on the north and south-

They are said to be about a hundred in number, but of these, some are exhausted or not worked. The depth of the wells appear to vary in tolerable proportion with the height of the well mouth about the river level, but an inspection of the lowest, situated near the bottom of the ravines, allowed it to be ascertained that all were sunk a good deal below the level of the ravine bottoms which bounded the plateau. Those measured on the top of the plateau, were 180 feet, 190 feet, and 270 feet, in depth, to the oil, and a fourth was said to be of a depth equal to 306 feet. So far as could be judged, the area within which these wells stand, does not exceed half a square mile. There is another group of wells in a valley about a mile to the south, the wells are in some places pretty close together; less, that is to say, than a hundred feet square. They are all exactly alike in appearance; rectangular orifices, about four and a half feet by three and a half, and lined with horizontal timbers the whole way down. The oil appears to be found in a stratum of impure lignite, with a good deal of sulphur. In one of the valleys is to be seen a stratum of this cropping out, with the oil oozing between the laminae. A rude windlass, mounted on the trunk of a tree laid across two forked stems, is all the machinery used. An earthen pot is let down and filled, and then a man and woman walk down the slope of the hill with the rope. The petroleum from these pits is very generally used as a lamp oil all over Burmah. It is also largely used on the wood work and planking of houses, as a preservative from insects and for several minor purposes, as a liniment, and even as medicine taken internally. It is said to be a sovereign remedy for the itch. There is a considerable export of this article from Rangoon to England; and in 1855, one of the mercantile houses at Rangoon had a European Agent residing on the spot. It is understood that the demand for it in England is as a lubricating oil, but it is also employed by Price's Company at Lambeth, in the manufacture of patent candles, and has been found to yield several valuable products. It has sold in the London market at from £40 to £45 a ton. The oil is of a greenish colour, of the consistence of thin treacle, and the smell is not unpleasant in the open air, if in moderate strength. Mr. Crawford speaks of the pits being spread over a space of sixteen miles, but all that Major Phayre's mission could hear of, were in the northern and southern groups, above alluded to. The northern group of wells, in 1855, contained about eighty wells then yielding oil. The southern group contains about fifty, which yield an inferior kind of oil mixed with water. At either place, there are many exhausted

wells; each group occupies about half a square mile or somewhat less. The wells are private property, the ground they occupy being owned by twenty-three families residing in Ye-nan-gy-oung. No one is allowed to dig a well within thirty cubits of one already being worked. The cost of digging a well of 150 cubits deep was said to be 1,500 to 2,000 tikals, sometimes even more; and the tikal averages in value something more than one rupee and a quarter or 2s. 6d. But a well dug within a few yards of another yielding a good supply, often proves a failure. The work of excavation becomes dangerous as the oily stratum is approached, and frequently the diggers become insensible from the exhalations. This also happens occasionally in wells that have been long worked. If a man be brought up to the surface with his tongue hanging out, said one of the informants, it is a hopeless case. If his tongue is not hanging out, he can be brought round by hand rubbing and kneading his body all over. Captain Macleod who saw the people engaged in sinking a well which had reached a depth of 125 cubits, says that each successive workman remained below only from fourteen to twenty-eight seconds, and appeared much exhausted on coming to the surface. The yield of the wells varies greatly. Some afford no more than five or six viss, whilst others give 100, 1,000, and even it is said, 1,500 daily. From all that could be learned, the average yield of the wells in the northern groups might be assumed to be about 200 viss. Generally, the supply from a well deteriorates the longer it is worked, and if it be allowed to lie fallow for a time, it is said that the yield is found to be diminished on the recommencement of work. The oil is described by the people as gushing like a fountain from the openings in the earth. It accumulates in the well during the afternoon and night, and is drawn off in the morning. The proprietors have the oil conveyed to the river side in carts loaded with earthen pots containing ten viss each. Purchasers generally buy at the river side. The ordinary price of the article used to be one tikal the hundred viss, or about sixteen shillings a ton. An intelligent proprietor, who was the my-ook of the town, stated that out of 27,000 viss, which formed the whole monthly yield of his wells, 9,000 went in payment to the work people, 1,000 to the king, and 1,000 to the lord of the district. The annular yield of petroleum, was estimated at 6,424,000 viss from the northern, and 730,000 from the southern group, making 7,154,000 viss annually, equal to about 11,690 tons: very various estimates have however, been formed of the annual productiveness of these wells:—

Captain Cox estimated it at,	56,960,000 viss.
Captain Macleod,	1,405,000 "
Mr. Crawford,	17,568,000 "

Petroleum has also been found and bored for near Jeypore, and at a place called Makoom a few miles beyond Jeypore on the Dehling. It is doubtful whether sufficient quantity can be found to make it a successful commercial speculation, but some experimenters are confident that petroleum and coal would give a good return. The "Tel gandak" of the Panjab is petroleum floating on water from the spring. Ratta Hotar hills. Petroleum is found at Jabba, a hamlet of Kussan, west of Chakralla, and about nine miles east of Kalabagh; at Dhadur, three miles west of Kabbakhi in the Salt Range; at Narsinghpur, in the Salt Range; at Jabba, near Nurpur; in the Algal ravine, at Kafir Kot, on the Indus, and in smaller quantities at some other places.

Petroleum is nearly allied with bitumen on the one hand and naphtha on the other, between which it occupies an intermediate place; the principal distinction being a difference of consistency and colour. Bitumen in its several varieties known as mineral pitch, asphalte, piasphaltum, &c., is solid or nearly so, and black or dark-coloured; naphtha is perfectly liquid and light in colour; petroleum, earth oil, or rock oil, is viscid or oily and greenish or reddish brown in colour. The principal supply of petroleum in the regions adjoining the Indus namely, at Jabba, near Kalabagh is in nummulitic limestone. At Kafir Kot, Dr. Fleming says, it exudes from brown bituminous sandstone. The mineral oil is usually found floating on the surface of certain springs, it is thus at Jabba, near Kalabagh, at Kafir Kot, and at a spring in the Kohat district, about four miles from Hungoo Khota and six from the Indus. It appears that the present cost of the Kalabagh petroleum, before despatch down the river, may be reckoned about Rupees 3 per maund. It is not stated that he had it boiled with vegetable resin, which is frequently done. Candles are made of paraffine, a substance obtained by Mr. Warren De La Rue's process from Burmah petroleum, and also produced by distillation of coal and other minerals of disputed relationship to coal. Paraffine oil, obtained by the distillation of petroleum, of coal, &c., is a lubricating oil of much value for machinery of all kinds, as it does not injuriously effect brass or other metals. At Baku, on the shores of the Caspian Sea, is a petroleum locality well known for ages past, and possessing a peculiar interest in connection with India as a place of hindoo pilgrimage at the present day and maintaining a small fraternity of resident brahmins, attendants on the sacred fire of the petroleum springs. The viscid mineral is rolled up into balls with sand, for the purpose apparently of obtaining a fuel in a convenient form. At the same place, and at

many others, petroleum is used also as covering for the flat roofs of houses. In the Trans-Indus, northern Derajat, &c., where it is found, it is the common application for sores on the backs of camels. Momyai, is a black substance principally clay, which, however, burns feebly and softens slightly to the flame of a lamp, giving out a peculiar empyreumatic odour. The momyai, "osteocolla" of native medicine, is also, when genuine a substance of this class; but it is of very high price, and its use is solely medicinal. The specimens purchased often consist of solidified mineral tar, or still oftener of lignite. Petroleum springs occur in Labuan. The petroleum of Yunnanyoung, in Burmah is unlimited in quantity but price high, being now a close monopoly of the king of Burmah.

The petroleum of Assam, Cheduba and Akyab is used by natives for burning; by Europeans for medical purposes; by both for varnish and to preserve wood. Also put on the bottoms of boats, it being an excellent preservative of wood from insects and worms. In the island of Ramree there are 13 wells, in Cheduba 22 wells. Each well produces about 2 maunds per season, the aggregate produce of all the wells being 70 maunds per annum. The produce might be increased some 10 to 20 maunds by digging more wells. No petroleum is exported from the province. The petroleum is thick and dark-coloured.

Ramree naphtha, is used as a varnish for oiling boats, posts, &c. There are 2 wells; they each produce about 14 maunds per annum. No great increase is expected. The naphtha is clear and bright, and none is exported. Price from 6 to 7 Rupees per maund, of 80 lbs.—*Honiberger*, p. 322; *Royle's Mat. Med.*; *Smith's Mat. Med.*; *Powell's Hand-book*, p. 20; *Dr. Buist's Catalogue*; *Tomlinson's Cyclopaedia*; *O'Shaughnessy*, p. 693; *Mason's Tenasserim*; *Yule's Embassy*, *Cal. Cat. Ex.* 1862; *Ainslie's Mat. Med.*, p. 31. See Asphalte: Bitumen: Naphtha: Rock oil.

PETROSELINUM SATIVUM, Hoffm.

Apium petroselinum, *Roxb.*

Bilati pitursilli,	ΒΡΗΓ.	Περροσελινον,	GER.
Common Parsley,	ENG.	Pitar seleri,	HIND.

Parsley, one of a genus of plants belonging to the natural order Umbelliferæ.—*Hogg.*, p. 382.

PETROMYZONTIDÆ, a family of fishes of the sub-class Cyclostomata, as under:

SUB-CLASS V.—Cyclostomata.

FAM. I.—Petromyzontidæ.

Mordacia mordax, *Rich.*, Tasmania, Valparaiso.
Gestria australis, *Gray.*, S. Australia.
Chilensis, *Gray.*, Chili, Swan River, New Zealand.

FAM. II.—Myxinidæ.

Bdellostoma cirrhatum, *Forsk.* S. Africa, Japan, New Zealand.

PETTAH, ANGLO-HINDI., from Peth a market, a bazaar, a town outside a fort. A town or suburb attached to, but distinct from a fort; a sub-division of a district. A town surrounding a fortress; the suburbs of a town.

PETTENKOFER, a medical man, of Europe, who promulgated the opinion that—

1. Cholera is due to a specific agent, say Z.

2. This is not passed off by the human body in a developed and active condition capable of producing the disease, but as an inert material capable of developing, say X.

3. In order for the conversion of X into Z, a suitable nidus for development is required, say Y.

4. This nidus Y is to be found in that layer of the soil in which the great seasonal changes of water-level occur. The greater these changes are, and the more charged with organic matter the soil is, the better the nidus is.

5. Organic matters tend to be washed down to this layer and there to accumulate, and it is a particular stage of moisture in this layer that provides the necessary soil conditions for the development of X. The necessary conditions may be absent from this layer being too wet or too dry,—if the former be the cause a subsidence of soil-water, if the latter a rise of its level, will furnish the change requisite for the development of X.

6. Granted that X encounters Y, the result is the formation of Z.

7. Z having been formed, it can only reach the body in two ways—by means of air or by means of water.

8. The former way is the common one—the poison Z rising through the interstices of the soil to the surface.

9. If therefore X does not meet with Y, or if, after Z is formed, it be shut off from the human subject by any impermeable layer between it and the surface of the soil, a similar result follows, *i. e.*, there is no spread of the disease in the locality even though X be introduced into it.

10. It is not then, any special soil that gives immunity, but special conditions of various soils. For example, a layer of clay is, if thoroughly dry extremely permeable, if moist very impermeable.

11. Air and water do not furnish the conditions necessary for the development of Z from X—but after it has been developed they form the means of its transmission.

12. Even in localities furnishing every condition for immunity one or two cases may occur, as in the first place individuals may bring in the poison in their own persons, and it is quite possible that in certain cases the whole of Z may not be converted into X while in the body, and a portion may escape un-

changed and still retaining its active fully developed properties.

13. In addition to the presence of X, Y and Z, personal predispositions have great influence in favouring the spread of the disease.

14. A small quantity of Z introduced into the body results in the production of a large quantity of X which, as such is inert, but is capable of developing Z.

PET-TIAN, BURM. A tree, abundant in Tavoy; not procurable in Moulmein, found in Tavoy and Mergui. When seasoned it sinks in water. Maximum girth and length not ascertained. A very hard and durable wood, used by Burmese for wedges.—*Captain Dance*.

PETTHAR, Petthiri, HIND. *Juniperus communis*.

PETTAGALLE KANDA, see Ruby mines.

PETUNIA, an ornamental genus of plants, easy of cultivation, the colours are white, purple, crimson and purple, or rose coloured; they grow readily from seed either in the rains, or cold weather, and form pretty border flowers.—*Riddell*.

PE-TUN-TZE, the Chinese name for a white earth used with Kaolin in the manufacture of porcelain. It is stated that while Kaolin is derived from the decomposition of the felspar of granitic rocks, Petuntze is the same mineral which has not suffered decomposition, and on account of its fusibility it is employed in glazing the porcelain.—*Eng. Cyc.*

PET-WOON, BURM. *Berrya mollis*, Wall.

PEU, TIB., a carbonate of soda, found all over Dingham and Tibet, south of the Yaroo; it appears as a whitish powder on the surface of the soil, never in masses under ground. It is not used to make soap or otherwise in the arts, a small quantity is always put into the water with tea; it is considered to improve the flavour, and it gives a high brown colour to the decoction. It is generally used in medicine.

PEUDI, HIND., Guz. Ochre.

PEUKELAOTIS or *Pushkalavati*, *Peukelas*, *peukalei*, *peukolaitis*, *proklais*. See Greeks of Asia.

PEUNIKA, TEL. *Clerodendron inerme*, Gaertn., Roeb., Rheede.

PEUPLIER, FR. Poplar.

PEU RA, Tibet goat, small, hairy, of all colours. Has an undercoat of fine wool, similar to the shawl wool, but there is no shawl wool trade from Eastern Tibet to India at present. Flesh pretty good.

PEUVAK—? *Areca* nut. See Ceylon.

PEUE, HIND. Kachra.

PEVETTI, MAL. *Physalis somnifera*, var. *P. flexuosa*, Nees.

PEWAN, HIND. Two small flat pieces of stoneware or porcelain, used by fine wire-drawers to grind the point of a wire between,

so as to be able to insert the point in the plate.
PEWAND, HIND. A graft. Pewandi, any graft tree.

PEW-BOCK, BURM. A tree of maximum girth 3 cubits, maximum length 25 feet. Very abundant along the sea coast near Tavoy and Mergui. When seasoned it sinks in water. It is a strong, tough, durable wood; recommended for helvcs.—*Captain Dance*.

PEWTER.

Risas,	Ar.	Stagno,	It.
Etain,	Fr.	Olowo,	Rus.
Zinn,	Zinngesserzin,	GER: Estano, Peltre,	Sp.

A compound metal made of four parts of tin, and one of lead; a finer kind consists of tin mixed only with a little antimony and copper. It is used in making plates, dishes, spoons, and such other domestic articles.—*McCulloch's Com. Dic., p. 900*.

PEYADASI, a buddhist monarch of the third century B. C., who set up inscriptions exhorting to peace and morality, the peoples in the eastern, northern and south-western regions of India.

PEYA IIERI, TAM. *Cassia occidentalis, Linn.*

PEYAJ, BENG. Onion, *Allium cepa*.

PEYARA, BENG. *Psidium pyrifcrum*, or pomiferum.

PEYAZ-I-DASITI, PERS. Squill.

PEY-CUMUTI-KAI, also Varri cumuti kai, TAM. *Colocynth*.

PEYGAL, TAM. Evil spirits or devils, represented as being very horrible.

PEYMARUTTIE, TAM. *Anisomeles malabarica*.

PEYPOODEL, TAM. *Trichosanthes cucumerina*.

PEYYAPA, or Pedda manu, TEL. *Ailanthus excelsa, R.*

PEYYA REGU, TEL. *Grewia orientalis, W. & A. 277—R. ii, 586*.

PEYYA RODDA, or Rotta, or Karu japhara, TEL. *Rottlera laccifera, Voigt*.

PEYZOO PASS, see Khyber.

PEZ, SP. Pitch; *Citrullus colocynthis*.

PFEES, SINDH. *Chamærops ritchiana, Griffiths*.

PFERD, GER. Horse.

PFOOL, HIND., the flower of the mahwa tree, a spirit from it is the favourite drink of a Rajput. Classically, in Sanscrit it is madhuca.—*As. Res., Vol. i, p. 300*.

PIA BHAN of Akyab. *Bignonia stipulata, Roxb.*

PHACELIA. A genus of hardy flowering plants, flourishing in any common soil; the flowers are curious, from the manner in which they slowly unroll themselves. Some are perennials, and others biennials; the flowers are chiefly pink and blue coloured—propagated from seed.—*Riddell*.

PHCENICIA, the narrow tract lying between the mountain of Syria and hills of Palestine and the Mediterranean. The ancient city of the name stood in L. 33° 34' north, on a promontary. India seems to have obtained an alphabet from the Phœnicians, about the fifth century B. C. about the time that the Greek letters became known on the higher feeders of the Indus.

PHCENICOPHAINÆ, a sub-family of birds, of the family Cuculidæ, as under:

Fam. Cuculidæ, 10 gen. 36 sp. viz.

Sub-fam. Cuculinæ, 3 gen. 2 sub-gen. 17 sp. viz., 9 *Cuculus*; 2 *Surniculus*; 3 *Chrysococcyx*; 1 *Eudynamis*; 2 *Oxylophus*.

Cuculus canorus. Common cuckoo.

Sub-fam. Phœnicophainæ, viz., 1 *Dasylophus*; 3 *Phœnicophaus*; 5 *Zanclostomus*; 1 *Rhinorthia*; 4 *Taccocain*; 5 *Centrophus*.

PHCENICOPHAUS CALLIRHYNUS, of Celebes, is one of the finest known cuckoos. Its bill is of a brilliant yellow red and black.

PHCENICOPTERINÆ, a sub-family of birds, of the family Anatidæ as under:

Fam. Anatidæ, Gooses.

Sub-fam. Phœnicopterinae, 1 gen. 1 sp. *Ph. roseus*.

Sub-fam. Anserinae.

Div. i. Swans, 1 *Cygnus olor*; 2 *C. atrata*.

„ ii. Geese, 3 *Anser*; 1 *Bernicla*.

„ iii. Perching geese; 2 *Dendrocygna*; 2 *Sarcidionis*; 1 *Nettapus*.

„ iv. Shieldrakes; 1 *Casarca rutila*; 1 *Tadorna vulpanser*.

Sub-fam. Anatidæ, 1 gen. 6 sub-gen. 10 sp. viz., 1 *Spatula*; 3 *Anas*; 1 *Dafila*; 1 *Chaulelasmus*; 1 *Mareca*; 3 *Querquedula*.

Sub-fam. Fuligininæ, contains one species of the genus *Biranta*, and four species of *Fuligula*, viz.:—*Fuligula ferina.* The Pochard, in circuit of northern regions, Barbary, common in India.

Fuligula nigroca. 'Ferruginous Duck.' Europe, Asia, N. Africa: common in India.

Fuligula marila. 'Scaup Duck.' Circuit of northern regions: Punjab, Sindh, Nepal.

Fuligula cristata. 'Tufted Duck.' Europe, Asia, Barbary: common in India.

Fuligula rufina. (Pallas), is the crested Pochard.

PIAETON, a genus of birds of the family Phaetonidæ.

Phaeton æthereus, Blyth, or redtailed tropic bird: also by seamen called "the boatswain" from the long tail feather, which they call a marline spike. They are seen seven and eight hundred miles from land.

Phaeton candidus, Brisson. The white tropic bird of tropical seas, Bay of Bengal to Mauritius.—*Collingwood*.

PHAG, HIND. *Ficus caricoides*, bat phagar, HIND., is *Ficus reticulata*.

PIIAGLU, HIND. A kind of bamboo in Kangra.

PIIAGORU, HIND. *Ficus caricoides*.

PHAGRI, HIND. *Loranthus, sp.*

PHAGURA, also phagwara or phagwart, HIND. *Ficus carica, Ficus caricoides*.

PIIAURA, HIND., a shovel, a hoc.

PHAILWAN, HIND. A wrestler. See Kush-tigar, Kelat, Phailwanzye.

PHAK, TIB. pig, two varieties. The Lho phak or southern pig which is most abundant to the south of Lassa, and is described as similar to the Indian village pig, and the small China pig now abundant in Lassa and other towns: no wild hogs anywhere in Thibet. The Chinese butchers in Lassa blow their pork and take in the country folks greatly by its fine appearance.

PHAKRA, HIND. *Premna arborea*.

PHAL, HIND., a ploughshare, a blade, an arrow head.

PHAL, also Bar or Mewa, HIND., PERS. Fruit.

Boen phal, HIND. Fungus, *sp.*

Duku phal, HIND. *Elaeagnus conferta*.

Kai phal, HIND. *Myrica sapida*.

Mend phal, HIND. *Randia dumetorum*.

PHALA, HIND. *Acacia modesta*.

PHALA, HIND., the iron point of a plough.

PHALA, a sort of frame used in the threshing floor.

PHALACROCORAX CARBO, 'Common cormorant.' Circuit of northern regions, Barbary: common in the Himalaya; rare in Central India.

PHALACROCORAX SINENSIS, see *Pelecanidae*.

PHALÆNA PATROCLUS, L. (Cramer, pl. *cix*, a, b,) a well known Burmese moth, a splendid species, common in collections from China, Assam, Sylhet, and Arakan.

PHALAHA or phalahar, HIND. Lawful food for Hindoos on fast days, such as buckwheat, &c. Lawful to be eaten in hindoo fasts.

PHALANGISTA MACULATA, this animal as big as a cat, has a long snout, large, round, protuberant eyes; yellow and brown spotted skin; long tail covered with hair on the upper part, but bare on the lower part and at the end. With its tail it fastens itself in climbing, and rolls it up when running. A female, had a yellow skin, with long soft hairs, but without spots, and had a pocket under the belly, formed by a fold in the hide, into which the hand could be inserted. She carries her young ones in it hanging on the nipples, until they have grown strong enough to leave this shelter.—*Journal of the Ind. Arch., June 1852, pp. 326-27.*

PHALANGUIM BISIGNATUM, a long black legged spider of Ceylon with a tiny white body; in the high country it congregates in groups of from fifty to a hundred in hollow trees. In the low lands they are not gregarious. *Tenney's Ceylon.*

PHALARIS ZIZINIA, Linn. *Andropogon muricatum, Retz.*

PHALAROPUS FULICARIUS, 'Grey Phalarope.' Circuit of northern regions: one specimen obtained near Calcutta, so late in the year as May 11, 1846, in the Calcutta provision bazaar.

PHALA SAMPENGA, or Manoranjitan Tel. *Artabotrys odoratissimus, R. Br., W. A. 33. Uvaria odoratissima, R. ii, 666. Rheede, vii, 46.*

PHALASI, woollen dresses, of Dera Gha Khan.

PHIA-LAUNG, BURM. Tadpole, in Araca a term of abuse of the British.

PHAL BABUL, HIND. *Acacia arabica* pods.

PHALGOON, is one of the hindoo months (spring, or Vasant. At Oodeypur the merry month of Phalgun is ushered in with the ahairea, or spring-hunt. The preceding day the rana used to distribute to all his chiefs and servants either a dress of green, or some portion thereof, in which all appear habited on the morrow, whenever the astrologer has fixed the hour for sallying forth to slay the boar to Gouri, the Ceres of the Rajputs the ahairea is therefore called the Muhorut ca sikar, or the chase fixed astrologically. As their success on this occasion is ominous of future good, no means are neglected to secure it, either by scouts previously discovering the lair, or the desperate efforts of the hunters to slay the boar when roused. As Phalgun advances, the bacchanalian mirth increases; groups are continually patrolling the streets, throwing a crimson powder at each other or ejecting a solution of it from syringes, so that the garments and visages of all are one mass of crimson. On the 8th, emphatically called the Phag, the rana joins the queens and their attendants in the palace, when all restraint is removed and mirth is unlimited. But the most brilliant sight is the playing of the holi on horseback, on the terrace in front of the palace. Each chief who chooses to join has a plentiful supply of missiles, formed of thin plates of mica or talc, enclosing the crimson powder called abira, which with the most graceful and dextrous horsemanship they dart at each other pursuing, caprioling and jesting. This part of it much resembles the Saturnalia of Rome on this day, when similar missiles are scattered at the carnival. The last day, or Poonim, ends the holi, when the nakarras from the Tripoli summon all the chiefs with their retinues to attend their prince, and accompany him in procession to the Chougan, their Champ d Mars. In the centre of this is a long sala or hall, the ascent to which is by a flight of steps the roof is supported by square columns without any walls, so that the court is entirely open. The festival of Huli, more classically called Hulica, otherwise Phalgutsava, meaning the festival of Phalgun, as occurring in the month of that name, commences about the full moon at the approach of the vernal equinox. It is one of the greatest festivals among the hindoos

and almost all sects seem to partake in its festivities; and all ranks, from kings downward, appear animated by the season, which is peculiarly dedicated to Krishna. Images of the deity are then carried about in palkis, and on elephants, horses, &c., attended by music and singing, and various antics. People of condition receive numerous visitors, who are entertained with dancing girls, music, singing, betel and rose-water. An annual festival to celebrate the birth of this god, is held in the month Bhadra. On this day his worshippers fast; but, on the conclusion of the worship, indulge themselves in music, dancing, singing, and various other festivities. In the month Shravana another festival is held in honour of him, which lasts from three to five days, during which the same festivities prevail; to which is added the ceremony of swinging the image of the god in a chair, suspended from the ceiling. In the month Kartika, a third festival takes place to celebrate his revels, among the Gopia; and in the month Phalguna is also held the celebrated festival of the dola, the ceremonies of which last fifteen days, and are accompanied with great splendour and festivity. During these holidays the hindoos of northern India spend the night in singing and dancing, and wandering about the streets, besmeared with the dola (a red) powder, in the daytime, carrying a quantity of the same powder about with them, which, with much noise and rejoicing, they throw over the different passengers they may meet in their rambles. Music, dancing, fire-works, singing, and many obscenities take place on this occasion. The Reverend Mr. Ward, says:—"At these times, the grey-headed idolator and the mad youth are seen dancing together, the old man lifting up his withered arms in the dance, and giving a kind of horror to the scene, which idolatry itself, united to the vivacity of youth, could scarcely be able to inspire." Krishna is also worshipped under his infant form as Gopala and Bala-gopala, and again as Gopce-natha, the god of the milk-maids. In the picture of Krishna, observes Sir William Jones, it is impossible not to discover, at the first glance, the features of Apollo, surnamed Nomios or the pastoral, in Greece, and Opifir in Italy, who fed the herds of Admetus, and slew the serpent Python.—*Tod's Rajasthan, Vol. i, p. 567.* See Krishna.

PHALGUTSAVA, see Krishna, Phalguna.

PHALI, HIND. In Karnal, a sort of Sal ammoniac.

PHALI GUAR, HIND. *Cyamopsis psoraloides*. Maror phalli, HIND. *Helicteres isora*. Mung phalli, HIND. *Arachis hypogæa*.

PHALJA, HIND. Hazara and Murre, *Populus ciliata*.

PHALLUS, GR., the priapus of the Romans and the Lingam of the saivite hindoos. Colonel

Tod says that no satisfactory etymology has ever been assigned for the name of the phallic emblem adored by Egyptian, Greek, Roman, and even by the Christian. He supposes that it may be from the same primeval language that formed the Sanscrit. Phalisa he says, means the 'fructifier,' from phala 'fruit,' and Isa 'the god.' Thus the type of Osiris can have a definite interpretation, still wanting to the lingam of Iswara. Both deities presided over the streams which fertilized the countries in which they received divine honours. Osiris over the Nile, from the Mountains of the Moon, in Ethiopia; Iswara over the Indus, (also called the Nil), and the Ganges from Chandragiri, 'the mountains of the moon,' on a peak of whose glaciers he has his throne. The Greeks, who either borrowed it from the Egyptians or had it from the same source, typified the fructifier by a pine-apple, the form of which resembles the Sitaphala, or fruit of Sita, whose rape by Ravana carried Rama from the Ganges over many countries ere he recovered her. In like manner Gouri, the Rajput Ceres, is typified under the cocoanut, or sriphala, the chief of fruit, or fruit sacred to Sri, or Isa (Isis), whose other elegant emblem of abundance, the camacumpa, is drawn with branches of the palmyra, or cocoa-tree, gracefully pendent from the vase (cumbha.) The sriphala is accordingly presented to all the votaries of Iswara and Isa on the conclusion of the spring-festival of Phalguna, the Phagasia of the Greeks, the Phamenoth of the Egyptian, and the Saturnalia of antiquity; a rejoicing at the renovation of the powers of nature; the empire of heat over cold, of light over darkness. Its worshippers, the Sivite sect appear to be the oldest now prevailing in British India, dating its origin there probably from the commencement of the Christian era, previous to which buddhism must have been predominant, when Asoca had so zealously laboured for its diffusion. The example of the Sivites must have emboldened the Sacta sectarians to introduce the worship of the female generative principle, the earliest mention of which is to be found in the Periplus, which alludes to the temple of Comori, at Cape Comorin in the second century. Before long, mutual affinity must have coalesced the two sects to merge their interests in one common superstition.—*Tod's Rajasthan, Vol. i, p. 599; Tr. of Hind., Vol. i, p. 265.* See Balanus, Lingam.

PHALLUS ESCULENTUS, Morilla (Fungus) Morels are imported from the hills in Lahore but are very little used by the natives; and the English use them, not medicinally, but for culinary purposes. The morels which are brought from the Hazara country, are large.—*Honig., p. 323.*

PHAL MODEKA, MALAY. *Batatas paniculata*.

PHARAOH.

PHALSA, HIND. *Grewia asiatica*.

PHALSI, HIND., a sherbet prepared from fruit of *Grewia asiatica*.

PHALWA, HIND. The grass, *Andropogon biadhi*.

PHALWAI, HIND., of Hazara and Murree, *Cesalpinia sepiaria*.

PHAMPLI, HIND. *Berchemia*, *sp.*

PHAN, HIND. *Rhus cotinus*.

PHANAH, a river near Belgutchee in Purneah.

PHAN-DAYAT, MAH. Antelope bezoartica, *Jerdon*.

PHANDWA. The head-quarters and civil station of the district of Nimar. It contains 1,219 houses and 9,708 inhabitants.

PHANGAN, a pass which leads to Man-chi in China occupies a little more than a month on its journey and leads over mountains 6,000 to 8,000 feet high. The Patkoy pass from Bamo and China, was the route followed by the Burmese in their invasions of Assam and is the means of communication between the Singpho tribes on the north and south of the Patkoy mountains. The passes through Assam are along the Dihong route into Tibet, the northern banks of the Lohit and through the Mishmi hills into Tibet called the Mishmi route.

PHANGRA, HIND. *Tribulus lanuginosus* and *T. terrestris*.

PHANSI, CAN. *Carallia lucida*, *Roeb.*

PHAO, HIND., of Lahaul, a substance put into ferment, a kind of spirit, which is put into the mixture called "lugri," when the fermented materials are placed in the still.—*Powell's Hand-book*, Vol. i, p. 312.

PHAORA, HIND. *Hoo*.

PHAP, HIND., a ferment for beer, &c.

PHAPAR-CHOR, BEAS. *Coriaria nepalensis*, *Wall.*

PHAPHAR, HIND. *Fagopyrum emarginatum*.

PHAPHAR, or Phaphra, HIND. *Fagopyrum esculentum*, Phaphar chor, HIND. *Coriaria nepalensis*.

PHAPHOR, HIND., a kind of morel in the Jhang district.

PHAPHOR, HIND. *Urginia indica*.

PHAPRA, HIND. Buckwheat.

PHAPRI, HIND. Thin biscuits; Phapri or Phapra means any thin shell-like substance.

PHAPRU SAG, HIND. *Pharbitis nil*; Til phar, HIND. *Impatiens*, *sp.*

PHARA, the wedge used to adapt the size of the shoe-maker's "kalbut" or last.

PHARAHITASA, see Kabul.

PHARAO, SIND. *Grewia asiatica*, *Linn.*, *Roeb.*, *W. & A.*

PHA-RAI, BURM. *Citrullus cucurbita*, *Water-melon*.

PHARAOH, a title of the rulers in Egypt,

PHARNACEUM MOLLUGO.

in the time of Moses, rendered famous among all nations who follow the Hebrew, the christian or mahomedan faiths. One of the Pharaohs is said to have followed the Israelites and been drowned in the Red sea. At Suez, after a north-westerly breeze has been blowing some time, the water recedes; and should it be followed by a south-east wind, it rises very suddenly, sometimes as much as six feet, and renders the ferry, situated about one mile and a half to the northward of the town impassable.—*Wellsted's Travels*, Vol. ii, p. 42.

PHARBITIS CŒRULESCENS, *Choisy*.
P. nil δ *cœrulescens*, *Roeb.* | Sky-blue *Ipomœa*, *ENG.*
Flowers large, in the morning of a pale blue, gradually growing darker.

PHARBITIS DIVERSIFOLIA, *Lindley*, is very like *P. hederacea* and *P. purpurea*.

PHARBITIS HEDERACEA, *Choisy*.
Ipomœa hederacea, *Linn.*

A plant of America and N. Holland,
PHARBITIS HISPIDA, the pale blue large flowered pharbitis.—*Riddell*.

PHARBITIS NIL, *Choisy*.

<i>Convolvulus nil</i> , <i>Linn.</i>	<i>Ipomœa cœrulea</i> , <i>Koen.</i>
<i>Ipomœa nil</i> , <i>Roeb.</i>	<i>Roeb.</i>
<i>Hub-ul-nil</i> , <i>AR.</i>	<i>Kala-dana</i> , <i>HIND.</i>
<i>Influton</i> , <i>"</i>	<i>Marchui</i> , <i>"</i>
<i>Aishq-pecha</i> , <i>"</i>	<i>Bildi</i> , <i>JHULUM.</i>
<i>Nil-kulmi</i> , <i>BENG.</i>	<i>Ker</i> ; <i>Kirpawa</i> , <i>"</i>
<i>Phapru-sag</i> , <i>BEAS.</i>	

This plant grows in all tropical countries, and throughout India, its seeds are used as a purgative, but are irregular in their operation. They are roasted slightly and powdered and the dose is thirty to forty grains. A cathartic oil is obtained from the seeds.—*Voigt*; *Birdwood*; *Irvine Gen. Med. Top.*, pp. 144-181; *Honigberger*, p. 291.

PHARBITIS PURPUREA.

<i>P. hispida</i> , <i>Choisy</i>	<i>Ipomœa purpurea</i> , <i>Linn.</i>
<i>Convolvulus purpureus</i> , <i>Linn.</i>	<i>" hispida</i> , <i>Zucc.</i>

Var. a. *purpurea*, *C. purpureus*, light purple.
" b. *violacea*, violet flowers.
" c. *elata*, *C. purpureus*, *var elatior*.
" d. *varia*, *C.* *varius*.
" e. *leucantha*, white flowers.

A plant of America.

PHARFURA, the fine enamelling on the back of jewelled ornaments, done at Jaipur, &c.

PHARID-BUTI, HIND. A mucilaginous plant found at Ajmere: used in sherbets.—*en. Med. Top.*, p. 149.

PHARNACEUM CERVIANA, *Linn.* Syn. of *Mollugo cerviana*, *Ser.*

PHARNACEUM MOLLUGO.

Ladies bed strew, *ENG.* | *Ghimasag*, *HIND.*
Wild in gardens during rains, sometimes used as a pot herb.—*Gen. Med. Top.*, p. 148.

PHASEOLUS ALATUS.

PHARISEE, from pharash, set apart, Hebrew reformers after the seventy years' captivity.

PHARNAVIS, a public officer under the Maratha government, the keeper of public registers, through whom all orders or grants were issued.

PHARNI, HIND. A leather-polishing tool.

PHARRASII of Curtius.

PHARWAN, also Pilchi, and Koa, RUKH. *Tamarix gallica*, Linn.

PHASEE, URIA. A tree of Ganjam and Gumsur, of extreme height 60 feet, circumference 6 feet, and height from the ground to the intersection of the first branch, 30 feet. A light hard wood, used for sugar presses, rice pounders, and bandy wheels, and occasionally for making boats of. It is tolerably plentiful.—*Captain Macdonald*.

PHASEOLUS, a genus of plants of the natural order Fabaceæ, the Bean tribe. The East Indian species are as under :

- aconitifolius*, Jacq. All India.
- aureus*, Roxb. Cultivated.

PHASEOLUS ACONITIFOLIUS, Jacq.

Dolichos dissectus, Lam.

Mat,	GUX.	Adas,	PERS.
Moot,	HIND., DEC.	Vasunta,	SANS.
Mash; Moth,	"	Mohue,	SINDH.
Aconite-leaved kidney	"	Tulka-pyre,	TAM.
bean,	ENG.	Kooncoomapesaloo,	TEL.

Grown as fodder throughout the Peninsula and in Upper provinces of India: in 100 parts,

Moisture	11-22	Fatty or oily matter	0-64
Nitrogenous matter.	23-80	Mineral constituents	3-56
Starchy matter.....	60-78		

This is a small pleasant tasted pulse, much cultivated in the higher provinces of India, where there are two kinds of it. The moth cultivated in the north-western provinces is used for feeding cattle. *Phaseolus aconitifolius* is cultivated in the Punjab, for food. Its roots, as well as those of *Phaseolus radiatus*, are said by Royle, to be narcotic.—*Ainslie*, p. 246; *Eng. Cyc.*; *Dr. Honigberger*, p. 323.

PHASEOLUS ALATUS, Roxb., also *Phaseolus amarus*, Roxb. Syns. of *Phaseolus rostratus*, Wall.

PHASEOLUS MUNGO.

PHASEOLUS AUREUS, or Soona Moong of the Bengalee, is cultivated in Bengal, but it is not known on the Coromandel Coast. It is sown, like the others, about the end of October or beginning of November, and reaped in February or the beginning of March.—*Voigt*, *Eng. Cyc.*

PHASEOLUS HIRTUS, Retz. Syn. of *Phaseolus mungo*, Linn.

PHASEOLUS LUNATUS, Linn.

P. maximus, Sloane.

Bun-burbutie,	BENG.	Lima bean,	ENG.
Country French beans,	ENG.	Duffin bean,	
Country Haricot,			

Sown in rows the same as other beans, but with a much greater space between; they require very strong sticks for support, and are ready in about six months. No very particular care is necessary. This is a most valuable bean, much prized by the European inhabitants of India; by some of whom it is preferred to the Windsor bean. It was originally brought to India from Mauritius and is extremely prolific.—*Jaffrey*; *Ainslie*, p. 240.

PHASEOLUS MULTIFLORUS, the Scarlet runner, is a native of South America. Both are delicate, and in England cannot be safely planted in the open air till the beginning of May.—*Eng. Cyc.*

PHASEOLUS MUNGO, Linn., DC., W. & A., Roxb., Vol. iii, p. 292.

var. (a.) chlorospermum.

P. hirtus, Retz.

Hali moong,	BENG.	Mung,	MAHE.
Hessaru,	CAN.	Danie masha,	SANS.
Oorud,	DUK.	Ulundoo,	TAM.
Green gram,	ENG.	Wooddooloo,	TEL.
Oorad,	HIND.	Pacha pesaloo,	"

This very pleasant tasted pulse is much prized, dressed in various ways. It is of great value whenever the periodical rains fail and rice cannot be grown, and famine is the consequence; in 100 parts,

Moisture,	0-20	Fatty or oily matter,	1-48
Nitrogenous matter,	24-70	Mineral constituents	
Starchy matter,	60-36	(ash)	3-26

It is commonly cultivated in the Punjab plains, and to 3,500 feet in the hills, for its pulse, which is considered nutritious and digestible. It will keep good for about three years if carefully preserved by packing it in parcels.

var. B. melanospermum, black seeds.

Phaseolus max, Roxb., Vol. iii, p. 295.

Mashi,	PANJAB.	Nalla-woodaloo,	

This valuable pulse gets its Tamil name from being nourished by the dews in January and February. It is a variety of the Patchay pyre. This is the most esteemed of all the leguminous genus *phaseolus* and bears the highest price. Its produce is about 30 fold. Natives make bread of its meal for many of their religious purposes, cattle eat the straw.—*Ainslie*, p. 243; *Oleghorn's Punjab Report*, p. 66; *Roxb.*, Vol. iii., p. 296; *O'Shaughnessy*, p. 317.

PHASEOLUS TRILOBUS, Ait., Roxb., W. & A.

Glycine triloba, Linn. | *Dolichos stipulaceus*, Lam.
Dolichos trilobus, DC.

Mugani, BENG. | Kulnee, Trianguli, HIND.
3 lobed bean, ENG. | Pilli pesara, TEL.

This species of *Phaseolus*, sown like any other beans, grows spontaneously everywhere in the Tenasserim provinces. Roxburgh says he never found it but in its wild state; Voigt says the leaves are said to be tonic and sedative, and are used in cataplasms to weak eyes.—*Mason*; *O'Shaughnessy*, p. 137.

PHASIANIDÆ.

PHASEOLUS ROSTRATUS, Wall, W. & A.

<i>Ph. alatus</i> , Roxb., RA.		<i>Ph. amarus</i> , Roxb.	
Bun burbuti,	BENG.	Karalsana,	TEL.
Hullunda,	HIND.	Karu alachanda,	"
Katon pairu,	MALAY.		

This species is grown in the Circars and in Malubar where the tuberous roots are eaten: other parts of the plant are used in medicine. *Voigt.*, *Roxb.*

PHASEOLUS VULGARIS, Linn.

French bean,	ENG.	Lobiya,	HIND.
Kidney bean,		Bakla,	"
Haricot bean,	"	Dambala,	SINGH.

Native of Cabul and Kashmir, said to be a native of India, but Dr. Royle states that seeds were brought to him from Cashmere, and he is therefore inclined to consider that it was introduced into Europe from the most northern parts, such as Cabul and Cashmere, and that this accounts for our being able to cultivate it at a lower temperature than other species of the genus.—*Eng. Cyc.*; *Voigt.*, p. 229.

PHASIANIDÆ, the pheasant family of birds, comprises the pea fowl, pheasants, jungle-fowl and spur fowl, all of them peculiar to Asia, India, Burmah and Malayana, some authors include also the turkeys. They frequent forests, jungles and thick coverts, perch and roost on trees:

Sub-Fam. Pavoninæ, Pea-fowl.

Pavo cristatus, Linn., Common peacock.
" *javanensis*, Japan
" *mutiens*, Linn., Burmese
Polyplectron tibetanum, Assam to Tenasserim.
" *bicalcaratum*, Linn., Malacca, Sumatra.
" *chalcurus*, Temm.
Argusanus giganteus, Temm. Malay Peninsula, Archipelago.

Sub-Fam. Phasianinæ, Pheasants.

Lophophorus impeyanus, Latham. The Monal Himalaya.
Crossoptilon auratum, Pallas. Snow pheasant. *tibetanum*, *Hodgson*.
Cerionus satyra, Linn., Sikim horned pheasant.
" *melanocephala*, Gray, Simla. "
" *temminckii*, Gray, China.
" *caboti*, Gould, "
Ithaginis cruentus, Hardw., Green blood-pheasant, Butan, Sikim.
Pucrasia macrolopha, Less., Purkas pheasant.
" *castanea*, Gould, North-west Himalaya.
Phasianus wallichii, Hardw., Cheer pheasant.
" *colchicus*.
" *torquatus*—? Ring-necked pheasant of China
" *mongolicus*, Gould.
" *versicolor*, *Vieillot*, Japan.
" *reevesii*, Gray, China.
" *sommeringii*, Temm., Japan.
" *lineatus*, Lath., Silver pheasant of Burmah.
Thaumalea picta—? China, Central Asia.
" *amherstiae*, *Leadbeater*, North China, Manchuria.
Gennæus nycthemerus, Gould, Silver pheasant of Himalaya.
Gallophasus albo-cristatus, Vigors. White-crested Kalij pheasant.
" *melanotus*, Blyth, Sikim, the Kalij pheasant.
" *horsfieldii*, Gray, Assam, Tipperah, Chittagong.
" *lineatus*—Assam, Burmah.

PHEASANT.

Sub-Fam. Gallinae; Jungle fowl, Fire backs, Black Pheasant.
Diardigallus prelatas, Bonap., Siam.
Gallus ferrugineus, Gmelin. Red jungle fowl.
" sonneratii, Temm., Gray " "
" stanleyi, Gray, Ceylon.
" furcatus, Temm., Java.
" aeneus, Temm. Batavia.
Galloperdix spadiceus, Gmelin. Red spur fowl.
" lumilosus, Valerie, Painted spur fowl.
" zeylonensis—? Ceylon.

The genus *Phasianus*, is higher up the Himalaya slopes than the *Gallophasius*, and the *Gallus* is still lower. *Phasianus colchicus* and the Chinese *Ph. torquatus*, readily intermingle and blend, wherever the latter has been introduced in Europe. *Phasianus colchicus*, the common pheasant was originally from Asia Minor. *P. torquatus* came from Shanghai about the middle of the 18th century, *P. mongolicus* from Mongolia. *P. lemmingii* from Japan. *P. reevesii* from China, and *P. versicolor* from Japan.

PHASIANUS GALLUS. *Sonnerat.* Syn. of *Gallus sonneratii*, *Temm.*

PHASIANUS INDICUS, Leach, Blyth, Sykes, Jerdon. *Gallus sonneratii, Temm.*

PHASMA, a genus of insects, called the walking stick insects. These and the green Mantis genus often escape observation from their resemblance to grass and brown twigs. The *Phasmæ* or Spectre insects are found in Asia, Africa, S. America, and Australia, and from their varied shapes are called Spectres, Phantoms, Devils, Horses, Soldiers of Cayenne, Walking Leaves, (*Phyllum*) animated sticks, &c.—*Codd.*

PHASRUK, CHENAB. *Verbascum thapsus, Linn.*

PHASSIE, MAHR. *Dalbergia paniculata, Roeb., W. & A.*

PHAT, HIND., the lower bar in a yoke.

PHATAKRI, HIND. Alum.

PHATAL PIPAL, HIND.? A tree of Chota-Nagpore, with a hard, white timber.—*Cal. Cat. Ex., 1862.*

PHATEE, HIND. A fine kind of cotton grown near Dacca, see Dacca.

PHATIS, GREEK. A Bard.

PHATMER, HIND. *Fraxœuria crispa.*

PHAT-PERA, HIND. The silk winder.

PHAT THAN, BURM. A tree of Moulmein, wood used for chisel handles.—*Cal. Cat. Ex., 1862.*

P'HAURA, HIND. A mattock.

P'HA YUNGB'HAN, BURM. *Allamanda cathartica, Linn., Koen.*

P'HA YUNG KHA, BURM. *Cucurbita maxima, Duch., W. & A.*

PHEASANT birds belong to the family *Phasianidae*. Gold and silver pheasants are inhabitants of China; but the golden pheasant, according to M. Temminck, inhabits not only

PHEASANT.

China and Japan, but the northern parts of Greece, as also Georgia and the Caucasus; and it has been met with even in the province of Orenbourg. M. Degland informs us, that M. Gamba, French Consul at Tiflis, met with this gorgeous bird in numerous flocks on the spur of the Caucasus, which extend towards the Caspian sea; and that now it has gone wild and multiplied in some of the forests of Germany. The golden pheasants inhabit no part of India; nor does any kind of Pheasant inhabit south of the Himalaya in British India and Ceylon, unless the different jungle-fowl be so designated.

Dr. Adams says that close to the melting snow, he came on several flocks of the great snow-pheasant, known to the Cashmerees by the names gor-ka-gu, and ku-buk-deri. It is also called "lepia" and "jer monal" in other districts westward. This species seems to frequent the high ranges of Afghanistan, and suitable situations all over the great Himalayan chain. There are three allied species, one of which is possibly only a local variety (*Tetraogallus tibetanus*); the other two are decidedly distinct. One of the latter is said to frequent the Ladakh mountains, it has a band on the front of the neck like the chuckor. He saw a flock of snow-pheasants together with quoir monal or snow-partridge (*Lerva nivicola*.) This handsome bird is not uncommon in certain localities and at high altitudes on Cashmere, Ladakh, and northwards. The snow-partridge breeds near the limits of vegetation, and lays from six to seven eggs. The black-headed or Hasting's pheasant (*Cerionis melanocephala, Gray*) is found on the wooded slopes of the Peer Pinjal. This noble representative of the *Phasianidae* is one of the gayest, and at the same time largest of its family. From the brilliancy of its plumage, it has been designated by Europeans the Argus pheasant, but the true Argus is a native of Sumatra and the Malayan peninsula. The most common local name for this species, besides the above, is "Jewar." In some parts of the Cashmere ranges, the male is called "sonalu," and the female "selalee." Its close ally, the Sikim horned-pheasant (*C. satyra*), has not been met with on the north-western Himalaya. The loud wailing cry of the Jewar sounds mournfully along the valleys, and is more often heard at dusk and break of day than at any other time. Oft, in the stillness of an alpine solitude, at his tent door, by the cheerful log-fire, Adams listened to the well-known wa, wa, wa, of this bird. Foremost of all the various species of pheasants stands the impeyan, or monal. This splendid bird, once so abundant in the western Himalaya, is now, comparatively speaking, restricted to certain localities in the wooded slopes of the

higher ranges. Whole tracts of forests, once dazzling with the gorgeous forms of these birds, are now without a single specimen; however, it will be long before it is extirpated, for its haunts are high up among the craggy rocks where few ordinary sportsmen venture. The average weight of an adult male monal is nearly 6 lbs.; that of the female about 5 lbs.; the young of the first year about 3 lbs. The favourite haunts of this species are in the deepest solitude of the forest, or among the bamboo and dense jungle which clothe the sides and bottoms of the valleys. It is found along the line of the Himalaya, from 6,000 to 8,000 or 10,000 feet, but is partial to localities. The monal is strictly alpine in its haunts and prefers the cooler regions of the middle ranges to the forests bordering on the plains of India. Hundreds are sold at Stevens' sale-rooms. They are bought chiefly to adorn ladies' bonnets. Its favourite food consists of acorns, earth-nuts, bulbs, wild strawberry, currants, &c. They may be met with in scattered flocks, singly, or in pairs. The female monal lays four to six eggs, very similar in colouring to those of the turkey. The young bird has the dark-brown plumage of the female until the autumnal moult. It has certain names in different localities—for instance, about Mussourie and Simla it is known by the name monal; to the eastward it is called Ratteah cawan, and Monalee. The male is the Lont and the female the Ham of the Cashmerians, who adorn their mosques with the brilliant feathers of the male. The plach pheasant, known by the local names Pukras, Coclass (*Pucrasia macrolopha*), is less plentiful, and does not appear so generally distributed as the monal. The cheer-pheasant (*Phasianus wallichii*), is one of the most elegant species to be met with in the Himalaya. It is likewise known by the local names Booinchil and Herrel. The male measures about 18 inches, exclusive of the tail, which varies from 20 to 26 inches in length. The naked skin around the eye is bright red. The iris is light brown. The tail is composed of eighteen feathers, which graduate in pairs, and are broadly barred with pale yellow, or dusky brown and olive blotches. The cheer frequents the lower and middle regions, and is seldom found at very high elevations. It delights in grassy situations, among stunted oak, or such like, and is generally met with in flocks of from six to twenty. The moment they are disturbed they separate and secrete themselves among the grass, or in the foliage of trees, whence it is said they have been knocked down with sticks.

The kalij, *Euplocomus albocristatus* is the most common and widely distributed of the Himalayan pheasants. There is a congener, with white markings on the crest and back,

found on the eastern ranges, Sikkim, &c. Mr. Blyth considers it a distinct species; and has named it *E. melanotus*. But Adonis has seen many old males of the *E. albocristatus* with very little white on the crown and back. The kalij pheasant ("Merghee kookera" of the natives) is plentiful along the great valleys, called Dhoons, bordering on the plains of India, up to elevations of from 6,000 to 8,000 feet. It prefers, however, the more southern ranges, and is seldom met with in the remote interior. The egg is white, and about the size of the bantam's. A nest may contain from nine to twelve, and even more eggs, which are hatched about the end of May. Grubs, insects, seeds, shoots and leaves of trees, constitute the favourite food of the kalij.

The red-legged partridge, better known in the east by the name of "Chukor," has a wide distribution. It does not differ in any well-marked particular from the Greek partridge of south-east Europe, and shows how easily species can be made. Lieut. Wood, in his journey mentions taking part in a hunting expedition, when the party bagged 500 chukor by running them down with beaters and dogs." Of *Perdix græca* there is a variety in the island of Crete. The chukor prefers barren mountains to the rich and luxuriant vegetation of the more southern ranges; bare stony ridges clad with low scrub are its favourite haunts. During incubation the male remains near the nest, and may be heard all day piping his loud call—"cuc cuc," resembling that of the domestic fowl. The Cashmerians call the bird "kau-kau" on account of its call.—*Adams*.

PIEDU, or fern, HIND. In Chamba, *Ficus roxburghii*; *F. macrophylla*, and *Ficus caricoides*.

PHEEA of the Hunnia, the marmot.

PHEES—? *Chamarops ritchiana*.

PHEET, GUZ., HIND. Ribbon.

PHENI, HIND. A sweetmeat.

PHENICIA, see Hindoo.

PHENILA, SANS. *Zizyphus jujuba*, *Lam.*

PHEROSOPHI, are found amongst the Coleoptera of Hong-kong.

PIESAK LANE, HIND. *Suaeda fruticosa*.

PHIET-WOON, BURM. *Corchorus olitorius*? also *Triumfetta lobata*? and *Grewia spectabilis*? *Grewia hookerii*.

PHEWA, in Thaneshwar, on a slab of sandstone in a temple, was a Sanskrit inscription of 279 Samvat, probably of the Vallabhi era. The character used in inscriptions was a variety of Kutila. The kings and princes mentioned, are Mahendrapala, Jatula, Vajrata, Yajnika, Sagga, Purna, Devaraja, Ramachandra bhoja. This inscription is very imperfect, but interesting, as throwing some light on a dark period of Indian history. If we may assume the bhoja of the

document to be the first of that name noticed by Abul Fazal and Prinsep, his era is definitely fixed.—*Vol. xxii, p. 673. McClelland.*

PHIH or Pruh, the name given by the Lepchas to the Butani.

PHILADELPHACEÆ, *Lindl.* The syringa tribe of plants comprising 1 genus, 1 species, viz.: 1 *Philadelphus*.

PHILADELPHUS, *sp.*

Buzzu, mudnu, zhoang, *SETLEJ.*

On the Suttlej what appears to be a species, occurs at from 8,000 to 9,500 feet, and is stated to be used for ropes.—*Dr. J. L. Stewart, M.D.*

PHILADELPHUS CORONARIUS. A handsome shrub, producing white blossoms, having the appearance and smell of orange flowers; propagated by seed or layers.—*Riddell.*

PHILIPÆA CALOTROPIDIS.

Bhum-por, HIND. Khalatri, PANJ.
Khurjin, PANJ.

This parasite grows on the roots of the Calotropis in Shahpur and is said to be used as fodder for sheep.

PHILIPPINE ISLANDS. The great group of the Philippines, although contiguous to the proper Indian Archipelago, differs materially in climate and the manners of its inhabitants. It extends over fifteen degrees from near latitude 5° to 20° N.; and consists of many islands of which only Lucon and Mindanao are of great size. The bulk of the people are of the same tawny complexioned, lank haired, short and squab race, as the principal inhabitants of the western portion of the Indian Archipelago. The focus of the aboriginal civilization of the Philippines, as might be expected, has been the main island of the group, Lucon. This is a corruption of the Malay and Javanese word *lasung*, meaning a rice-mortar. The Spaniards are said to have asked the name of the island, and the natives, who certainly had none, thinking they meant a rice-mortar, which was before the speakers at the time, answered accordingly. In the Philippines, are many separate nations or tribes speaking distinct languages, unintelligible to each other. The principal languages of Lucon are the Tagala, the Pampanga, the Pangasinan, and the Iloco, spoken at present by a population of 2,250,000; while the Bisaya has a wide currency among the southern islands of the group, Leyte, Zebu, Negros and Panay, containing 1,200,000 people. Mr. Crawford tells us that it does not appear, from a comparison of the phonetic character and grammatical structure of the Tagala, with those of Malay and Javanese, that there is any ground for fancying them to be one and the same language, or languages sprung from a common parent, and only diversified by the effects of time and distance, and that an examination of the Bisaya Dictionary gives

similar results. The great islands of Mindanao, Palawang, and the Sulu group of islets, forming the southern limits of the Philippine Archipelago, contain many nations and tribes speaking many languages of which little has been published. Mr. Crawford, on the information given by Mr. Dalrymple, informs us that even in the little group of the Sulu islands, a great many different languages are spoken, and he gives a short specimen of 88 words of one of those most current.

Sulu has for many years been the market where the Lanun and other pirates disposed of much of their plunder, and in former times itself was decidedly piratical. The mahomedan religion has made much progress in Mindanao and the Sulu islands, as has the Malay language, the usual channel through which it has at all times been propagated over the islands of the Indian Archipelago. Mr. Crawford remarks that whether the principal languages of the Philippines be separate and distinct tongues or mere dialects of a common language, is a question not easy to determine. Certainly, the phonetic character of the Tagala, the Bisaya, the Pampangan, and Iloco are, sound for sound or letter for letter, the same. Words of the Malayan languages are to be found in the language of the aboriginal inhabitants of Formosa, or Taiwan; and as this large island, about half as big as Ireland, stretches as far north as the 25° of latitude this is the extreme limit in a northerly direction to which they have reached. The aborigines of Formosa are short in stature, of tawny complexions and lank hair. Although inhabiting a great and fertile island, affording to all appearance a fair opportunity of development, they never made any progress in civilization, and at present seem to live in a state of barbarism. They are thought by Mr. Crawford to belong to, or much to resemble, the brown complexioned race of the Archipelago of whom the Malays are the type.

The entire population of the Philippine Archipelago, is estimated at 4,000,000, of whom 3½ millions are christians. The Indian race are in general superstitious, credulous, fond of gaming, and particularly addicted to cock-fighting. The Negritos are said to be the original inhabitants of the islands who retired before the invading Indians. The extent of this Archipelago is 300 leagues from north to south, and 180 leagues from east to west. It is made up of countless islands. This Archipelago received its name after Philip the Second of Spain, in whose name they were finally conquered, pacified, and peopled.

The Negritos, of the Philippines, are polytheists, but without temple or ritual. They believe in omens, invoke Camburan (God), the

moon and stars, and adore the rainbow after a storm. They have also a worship of ancestors, a god of the harvest, of the fisherman and hunter; and a remnant of fetichism in a grotesque native devil.

Negros or Buglas island, extends from lat. $9^{\circ} 4'$ to $9^{\circ} 50'$. Of the central group of the Philippines, consisting of Panag, Negros, Samar, Leyte, Masbate, Bohol, and Zebu, the two former are the only islands in which Negrito tribes exist to the present day, and even as regards Panag, the fact must be considered doubtful. Negros, however, contains a considerable Negrito population, the crest of the mountain range, which extends throughout the length of the island, a distance of one hundred and twenty miles, being almost exclusively occupied by scattered tribes.

The Philippine archipelago, of innumerable islands, is about 300 leagues from north to south and 180 leagues from east to west. The Caraballos range of mountains runs through the centre of the whole, and in Luzon, the mountains are occupied by unsubdued races of idolatrous Indians. There are large lakes in most of the islands and Mindanao, "men of the lake," gets its name from its numerous waters. There are thermal springs at La Laguna, and boiling springs north in the district of Mainit. There is a rainy season of 6 months and a mixed one of equal duration. No rich spices, no precious gums, no abundance of rare metals or drugs, were there to allure Spanish cupidity. The Spaniards, nevertheless, appear to have been guided in their plans of colonization—at least in India, by a theory which nations still more great, and infinitely more free, might have adopted with advantage to themselves and to all humanity. They were not sordid monopolists; they ruled less by terror, and more by moral influence and the persuasions of their priests; and their power, not founded on the edge of the sword, was tolerable to the native race. They encouraged settlements; they allowed freedom to traffic; and though they levied unjust and irksome taxes, their system has been productive, within its narrow sphere, of more good than that of other conquerors in the Oriental Archipelago. That their commerce in the further east never developed itself to any lustre or grandeur, is true; but it was because their monopoly was less rigid, not because their vigour was less manly than that of the Dutch. Had Spain been more energetic, and still more liberal, her prosperity in the Indian Archipelago might have rivalled that which she once enjoyed in the western world. The Tagala, who dwelt in the district round about Manila, and are derived according to their traditions, from the Malays, have submitted thoroughly to their rule and become the

servants of strangers. The Zebuan appeared firm in the defence of their independence; but were driven from their position by a body of men landed in good order from the ships. The island of Luzon, with its fertile soil, and attractive aspect, tempted their desires. It is the largest of the group, and the best known to Europeans. Long and narrow, four hundred and fifty miles by from ten to a hundred and forty—its coast is fringed with rocks and broken by many gulfs, inlets and capacious bays. The surface is covered through a large portion of its extent by mountains—two high ranges in the north being divided by the Cagayar river, which flows between two headlands into the sea. In all respects Luzon appeared to them a desirable field for colonization, and the Spanish settlers considered themselves equal to its subjugation.

The *Aheta* or *Negrito*, of the Philippines, are a Papuan race, the second name, meaning little Negro, being given to them by the Spaniards; but that of *Ita* or *Aheta*, so pronounced but written *Ajeta*, is their usual appellation among the planters and villagers of the plains. The woolly haired tribes are more numerous in the Philippines than in any other group of the Indian Archipelago, they were estimated, by M. Mallat, in 1842 to amount to 25,000. The islands Samar, Leyte, and Zebu, have not any of them; but they are found in Negros, Mindanao, Mindoro, and Luzon. In the early accounts of them by Spaniards, they are described as being smaller, more slightly built and less dark in colour, than the Negros of Africa, and as having features less marked by the negro characteristics, but as having woolly instead of lank hair; and their social condition could not then have been much better than now, since they are described as living on roots and the produce of the chase; and as sleeping in the branches of the trees, or among the ashes of the fires at which they had cooked their food. They are all well-formed and sprightly, but very low in stature, as they rarely exceed four feet and a half in height. The character of the negrito is untameable, and it is impossible to surmount their tendency to idleness. Prompted by an irresistible instinct to return to the place of their birth, they prefer a savage life to all the charms of civilization. They are ebony-black like negroes of Africa. Their hair is woolly, and as they take no pains in clearing it, and do not know how to arrange it, it forms a sort of crown round the head, which gives them an exceedingly fantastic aspect, and makes the head appear, when seen from a distance, as if surrounded with a sort of aureole.

Among the *Aheta* of the Philippine islands, when a man wishes to marry a girl, her parents

send her before sunrise into the woods. She has an hour's start, after which the lover goes to seek her. If he find her and bring her back before sunset, the marriage is acknowledged; if not, he must abandon all claim to her. The Alfuros, seem to have affinities with the Tagala race of the Philippines, through the Sanguir islanders. Mr. Crawford observes that the sailors of the Philippines are so dexterous, that they are used, almost exclusively, in the other islands, as steersmen, and as such have a preference in many parts of the east. The Indians of the Philippines are among the best favoured of the Asiatic islanders, but they are not reckoned so brave as the Malays. They are a quiet inoffensive race, clean and well-shaped, and are all converted to the Catholic faith. A line commencing to the east of the Philippine islands, thence along the western coast of Gilolo through the island of Bouru and curving round the west of Flores, then bending back by Sandalwood island to take in Pratti, will separate the Malayan and all the Asiatic races, from the Papuans and all that inhabit the Pacific, though along the line of junction intermigration and commixture have taken place.

Mr. Crawford remarks that whether the principal languages of the Philippines be separate and distinct tongues or mere dialects of a common language, is a question not easy to determine. Certainly, the phonetic character of the Tagala, the Bisaya, the Pampangan, and Iloco are, sound for sound or letter for letter, the same. The alphabet of the Tagala nation of the great island of Lucon or Luconia, consists of 13 characters. It is the only one existing in the whole of this group, and seems at one time to have been used among the civilized tribes of the neighbouring islands, having spread even to Magindanan and Salu. The forms of the letters are rather bold and more complex than that of the Sumatran alphabets.

Spain has in all her conquests kept prominently before her the propagation of Christianity in the form embodied in her Church. The Philippines, therefore, present a spectacle which contrasts strongly with the Dutch dependencies in the East. Spain appears in the Archipelago in her religious earnestness, her ecclesiastical assumption, and her gorgeous establishments. The natives of the Philippines have generally been converted and received into the Catholic Church. It is observed by Malte Brun, in his sketch of the inhabitants of the Philippines, that they are the only people in the eastern Archipelago who have improved in civilization from an intercourse with Europe. A commercial monopoly formed no part of the Spanish policy in that quarter of the world.

The bounties which nature has showered on these islands have often been neutralised by the terrible forces hidden under their beautiful exterior. They are often shaken by earthquakes, and volcanic explosions are so frequent as to be regarded almost as common occurrences. In no other part of the world are storms so terrific as there during the change of the monsoon. Australia and California, Sir John Bowring thinks, will hereafter be largely if not wholly supplied with sugar from the Philippines. Manilla hemp has acquired a high character in Europe: 25,000 tons were shipped in 1858 from Manilla alone, of which Great Britain received one-fourth. Gold is found in the mountains and in alluvial deposits, and with proper machinery copper may be raised in abundance. A sample taken from a lode, seven feet in width and only four yards from the surface, gave an analysis 44 per cent. of pure metal.

Walton states from the collective returns recently made out by the district magistrates, 't would appear that the total number of tributes amounts to 386,654, which multiplied by 6½ produce the sum of 2,515,406, at which he estimates the total population, including old men, women and children:—

Indians of both sexes....	2,395,687
Sangley Mestizos.....	119,719
Sangleys.....	7,000
Whites of all classes....	4,000

Comparison of population in 1791 and 1810:

	Year 1791.	Year 1810.
Indians....	1,582,761	2,395,687
Mestizos....	66,917	119,719
	1,649,678	2,155,406

The provinces are frequently visited with dreadful hurricanes, called in the country, *leaguicos*, and often desolated by locusts. The *sileuca* is a logwood of an excellent quality. They have also the *brazileto*, another dye-wood; the eagle-wood, *narra*, a species of red ebony striped; the *tindal*-wood, all red; the sandal-wood; the *pangasinang* fir, the *molave*, an incurrutable wood, the *guijo*, excellent for ship-building, as well as the *banava*, *calantes*, or Philippine cedar, the *sagovan*, red and white, *mary-wood*, for small masts, spars, &c., the *manga-chapuy* betis, *dasag*, *dungol*, *calumpan*, and many others.

Gold abounds in Luzon and in many of the other islands; but as the mountains which conceal it are in possession of the infidel Indians, the mines are not worked; indeed it may be said they are scarcely known. The savages collect it in the brooks and streamlets. The natives of the province of Camarines in Luzon partly devote themselves to the working of the mines of Mambulao and Poracale, which have the

reputation of being very rich. The natives distinguish the varieties of rice by the size and shape of their grain, viz :

Binambang.—Leaves slightly hairy ; glumes whitish ; grows to the height of about five feet ; flowers in December : aquatic.

Lamuyo greatly resembles the above ; is more extensively cultivated, particularly in Bantangas, where it forms the principal article of food of the inhabitants of the coast : aquatic.

Malagoquit.—Derives its name from its being very glutinous after boiling ; it is much used by the natives in making sweet or fancy dishes ; and also used in making a white-wash, mixed with lime, which is remarkable for its brilliancy, and for withstanding rain, &c. : aquatic.

Malagoquit.—With smooth leaves, and red glumes (all the preceding are whitish) ; possesses all the qualities of the aquatic variety of the same name—that of being very glutinous after boiling. This rice is said to be a remedy for worms in horses, soaked in water, with the husks on : it is given with honey and water.

Bmolot Cabayo.—Common in Hocos, where it is cultivated both upland and lowland ; it produces a large grain, and is therefore much esteemed, but has rather a rough taste.

Dumali, or *early rice*.—Raised in the uplands exclusively, derives its name from ripening its grain three months from planting ; the seed is rather broader and shorter than the other varieties ; it is not extensively cultivated, as birds and insects are very destructive to it.

Quinanda, with smooth leaves.—This variety is held in great estimation by the people of Batangas, as they say it swells more in boiling than any other variety ; it is sown in May, and gathered in October : upland.

Bolohan.—This variety has very hairy glumes ; it is not held in much esteem by the natives, but it is cultivated on account of its not being so liable to the attacks of insects and diseases as most of the other upland varieties.

Tangi.—Leaves slightly hairy, glumes light violet color. This upland variety is held in much esteem for its fine flavour.

435,067 arrobas of rice were exported from Manila in 1847.—*M. Earl*, p. 141 ; *Mr. Rich, botanist to the United States exploring expedition* ; *Lubbock's Orig. of Civ.*, p. 82 ; *Murray's Indian Archipelago*, p. 126 ; *Wallace*, Vol. ii, p. 218 ; *Quarterly Review*, No. 222 pp. 507, 508 ; *Walton's State*, pp. 4, 27, 28, 31, 82, 121, 276 ; *Earl, Papuan's*, pp. 121 to 131 ; *St. John's Indian Archipelago*, pp. 165-77. See *Ahetas*, Archipelago, India, Negros, Negritos.

PHILISTINE, or foreigners, who gave that name to Palestine, where they opposed the Jews in the conquest of that country.—*Sharp's History of Egypt*, Vol. i, p. 29.

PHILLU, HIND. *Hamiltonia suaveolens*.
PHILYDRACEÆ, the water-wort tribe of plants.

PHILLYREA. Of this genus, Wight in *Icones*, gives, *P. robusta*, *terminalis* and *affinis*.

PHILLYREA PANICULATA, A small tree with oblong ovate leaves ; flowers in terminal panicles, pure white, bending down the branches, and giving the tree a graceful appearance. Introduced from China.—*Riddell*.

PHI-LOK, see Laos.

PHILOMACHUS PUGNAX, or *Machetes pugnax* ; 'Ruff.' Europe, Asia, N. Africa : common in India.

This green possesses a considerable degree of acrimony which the natives temper by an admixture of some agreeable acid. Rumphius tells us that the Worians in Amboyna squeeze the acrid juice of the plant, into their eyes to make them bold and intrepid in war.—*Rumphius*, vi, p. 40; *Ainslie's Mat. Med.*, p. 257.

PHILOX, a genus of elegant plants, which, from their lively colours have a pretty appearance when grown in patches, the colours are red, purple, lilac, white, &c., grow readily from seed in a light garden soil, either in pots or the flower beds, should be sown thinly, and when one or two inches high, transplanted where intended to flower, require in pots a somewhat loamy soil well manured and drained.—*Riddell*, *Jaffrey*.

PHIOBEROS GÆRTNERI, *Thunb.* Katu kurundu, SINGH.

PHIOBEROS HOOKERIANUS, *Wight*. A large tree of the central province of Ceylon, at an elevation of 4,000 to 7,000 feet.—*Thw.*, p. 17.

PHIOBEROS ROXBURGHII, *Bennet*.

Ludia spinosa, *Roxb. Fl. Ind.*
Flacourtia stigmata, *Wall., Cat.*

A tree of Sumatra, Fl. small, reddish-white, March and April; fr. Sept. *Roxb.*

PHOCAENA COMPTIS.

Ph. rondeletii, *Willughby*.
Delphinus phocaena, *Linn.*

The common porpoise.

PHOCA. The seal. The seal may be taught to assist in fishing. Apollonius related that he had seen at Ægæ, near Issus, a female Phoca, which was kept for fishing purposes.—*Fule Cathay*, Vol. i, p. 112.

PHENICIA. This ancient kingdom was on a narrow fertile strip of land, lying between the western slope of Lebanon and the Mediterranean sea, and extended from the river Eleutherus on the north to near Mount Carmel in the south. In Jeremiah 44th., 15-17 and 19 it is called the Queen of Heaven. See also Judges x, 6, 1 Samuel vii, 3, xii, 10. Astarte, or Ashtoreth or Baalith, the Queen of Heaven, the great female divinity of the Phœnicians, the female power of Baal, whom the Greeks changed into Baaltis or Belthes, in the chief city of Sidon, but her worship was extended to the east of Jordan. Physically, she represented the moon, hence her name in Gen. xiv, 5. Deut. i, 4. Josh. xii, 4. Ashtaroth karnaim or the two horned, from the crescent moon. See 1 Kings xi and 5;

PHENIX DACTYLIFERA.

53, 2nd Kings xxiii, 13; vii, 18; xlv, 25. It was by the names, Ashtoreth or Astarte that the moon was worshipped by the Israelites, Assyrians, Phœnicians, Carthaginians and the people of Tyre and Sidon. See Baal, Hindu, India, Ken, Semitic races.

PHENICOBALANUS of the ancients was probably the nut of the Doum palm of Egypt.

PHENICOPHAUS CURVIROSTRIS was observed by Captain Tickell on low jungly hills, very like *Ph. tristis* in habits, a pair shot were both precisely similar, except in colour of iris; the male having that cobalt blue and the female orange. Food Coleoptera, Hemiptera, and very large caterpillars.

PHENICOPHAUS TRISTIS, "Mahoka" of the natives of India, has a note like that of the British cuckoo, as heard late in the season.—*Hooker, Him. Jour.*, Vol. i, p. 27.

PHENIX. A genus of palms, the species of which are found in the south of Europe, in the north of Africa, and in the south of Asia, eastwards to the Archipelago, the date tree is indigenous to Africa and Asia and embraces several species, the products of which are brought into the markets of India. The trunk, marked with the scars of fallen leaves, is, in some species, so short that it hardly appears above ground. It is not decided whether the East Indian *P. sylvestris*, *Roxb.* be or not the *P. dactylifera* of Linnæus in a wild state.—*Seeman*.

PHENIX ACAULIS, *Ham.*

Stemless date-palm.		Pind khajur,?	PUNJAB.
Schaap,	LEPCH.		

A small stemless palm which grows in Sikim on the driest soil and in the deep valleys. The Lepchas eat the young seeds and use the feathery fronds as screens, when hunting. It is a dwarf palm growing east of Siligore in the Terai; a sure sign of a hungry soil.—*Dr. J. L. Stewart's Punjab Plants*, p. 243; *Hooker's Him. Jour.*, Vol. i, pp. 143, 400.

The date tree grows in tropical and middle Asia, in north Africa, and in some parts of Northern India. It does not thrive in Bengal,

PHOENIX FARINIFERA.

at it is the great support of the Arabs of Yemen. Dr. J. L. Stewart says, it was introduced into the southern Punjab in the 7th or 9th century, but that the true date is nowhere known in any quantity to the north or east of Tulamba and Jhang both close to the Chenab, although the tree has been tried in the districts of Lahore and Umritsur, and there are a few in the northern part of Jalandar, where, however, the chief use of the tree is for the sweet juice. He also mentions that there are some at Saharanpur, which give good fruit especially when the rains are late. The finest trees range up to 100 and 120 feet high, the natives assert that it will not grow except where the soil is or has been subject to inundation. There are now hundreds of the trees about various towns in Multan and Mozaffargarh, but it is most abundant near Dhera Ghazi Khan, Trans-Indus, where the country for ten or twelve miles from north to south has such numbers of trees that eight or ten thousand rupees are said to be annually got by government from the small tax which is levied on each female tree the sexes are on separate individuals. At Multan there is a bedana (*i. e.*, seedless) fruit in which the stone and its kernel are represented only by a little shrivelled membrane, the rest of the fruit consisting of the pleasant sweet pulp. Edgeworth states that there is only one tree producing these, which was formerly reckoned badshahi, "royal" *i. e.*, the produce was reserved for the ruler of the country. But several trees produce these which are the upper fruit ripening after the lower ordinary dates of the same tree. The fruit of a female tree is much more valuable than its sugar, and the male tree has but little juice. The terminal bunch of young leaves, taken only when a tree is cut down, is much eaten by the natives both raw and cooked. There are at least sixty varieties of dates. The date stones are made into beads, the leaves are made into couches, baskets, mats, bags, brushes, fly-traps. —Dr. J. L. Stewart's *Punjab Plants*, p. 245; *Seeman on Palms*; Dr. Mason's *Tenasserim*; *Roxb., Flora Ind.*; *Royle's Fibrous Plants*; *Ainslie*, p. 30; *Voigt's Hortus Suburbanus Calcuttensis*; *Powell's Hand-book*, Vol. i, p. 379.

PHOENIX FARINIFERA, Roxb., Cor.

Pntha,	Phœnix pusilla, Gaertn.	
Pthl,	MAH. KAL. Chiruta ita,	TEL.
	TAM. Chittita chettu,	"

This dwarf palm grows in the sandy plains of the south of India, where the sweet pulp of its seeds, also the farinaceous substance of its stem are eaten in times of scarcity. The stem is split into pieces beaten in mortars and sifted and sago is boiled. It has a bitter taste, as thus prepared and is not so nutritious as common sago. The leaflets are made into mats, and the common petioles are split into three or

PHOENIX SYLVESTRIS.

four and are used to make baskets of various kinds. It is a dwarf plant, the trunk about one or two feet high, and so enveloped in the leaves as to appear like a bush. It is common on the peninsula of India, on dry barren sandy ground. Its leaflets are wrought into sleeping mats. The common petioles are split into three or four, and used to make baskets of various kinds. The exterior or woody part of the trunk consist of white fibres matted together, these envelope a large quantity of farinaceous substance which the natives use for food in times of scarcity. To procure this meal, the small trunk is split into six or eight pieces, dried, and beaten in wooden mortars, till the farinaceous part is detached from the fibres; and the meal, when separated by sifting, is fit for use, by being boiled into a thick gruel or conjee. It is, in fact, an inferior sago. —*Seeman on Palms*.

PHOENIX HUMILIS, Royle. Dwarf date-palm. —Dr. J. Stewart's *Punjab Plants*, p. 245.

PHOENIX PALUDOSA, Roxb., Corr.

The marsh-date palm.

Hintal,	BENG. Giruka tati chettu,	TEL.
Then boun,	BURM. Hintalamu,	"

This small palm, grows plentifully on the Sunderbuns, South of Calcutta, on the low islands in the rivers, and on the shores which are inundated with the highest tides, the marsh-date palm abounds. It is a small tree about twenty feet high, no thicker than a walking cane; whose fruit looks precisely like a bunch of dates, but it is not edible. Griffith says it is well-worth cultivating on account of its elegant impenetrable tufts, which well adapt it for bank scenery. *P. paludosa*, is the most southern Indian species of the phoenix palms. The trunks of the smaller trees serve for walking sticks, the long trunks for rafters and the leaves for thatch. —*Hooker's Him. Journ.*, Vol. i, p. 1; *Mason*; *Seeman*.

Khajoor,	" Ita chettu; Ita,	TEL.
Sendi,	MAHR. Pedda ita,	"
Khaji of Salt Range,	RUS.	

The wild date palm grows throughout British India and is of great value on account of the palm wine it yields and the sugar made from the palm wine. It occurs wild in many places in and near the Siwalik tract up to and probably beyond the Indus, in the Salt Range, and out into the plains in the east of the Punjab. It is not seen much above 3,000 feet, in the outer hills, and Vigne correctly points out that the "palms of Baramoule" in Kashmir were creations of Moore's imagination. If not too early notched for the wine, it grows straight and very tall, length of trunk being 50 feet, and girth

2 feet; attains full size in 40 years. Its wood is used for water conduits, and for temporary bridges; leaves extensively employed for matting floors. This date tree is found in almost all the desert districts of the Sind Sagar Doab; they grow on the borders of sandy tracts, and in such land that little else grows there. The fruit forms the staple of food in some districts, and is known by different names, according to the method by which it is preserved, split, dried, boiled in oil, &c. These date trees pay a tax to government, which forms an important item in the "sair" revenue of some districts. Mr. Coldstream writing of this tree in Muzaffargarh says it does not grow actually in the sandy desert, but flourishes on its borders in the most wretched soil, and where hardly any other vegetable exists; it is often found in luxuriant groves.—*Dr. Stewart's Punjab Plants*, p. 245; *Balfour*, p. 187; *Roeb.*, *Powell*, *Stewart*.

PHOG, HIND. *Polygonum convolvulaceum*, *Calligonum polygonoides*, also *Ficus caricoides*. PHOG or Phogli, HIND., a wild grain. PHOG, dregs or lees of anything after infusion, &c.

PHOGLI of Muzaffargarh is from the plant called Phoke found in desert tracts in the Panjab. It somewhat resembles the caper in its habit and colour, being destitute of true leaves and composed of numerous fine and angular branchlets. It is much more slender than the caper and does not attain to the same size. The flowers and fruit, which are very small and of a grey colour, fall off on attaining to maturity, and are gathered by the natives, who mix them with ghi, and use them as a relish. The fruit is called phogli, and is well known throughout the districts.

PHOGLI, HIND., a term applied to a coil of fine gold wire in spangle-making.

PHOGRI, HIND. *Ficus reticulata*.

PHOLSAH, HIND. Lightning struck.

PHOK, HIND. *Calligonum polygonoides*.

PHOLADIDÆ, a family of molluscs.

Xylophaga, *rec.* 2 sp.

Teredo. *Syn.* Septaria, *rec.* 14 sp., *fossil* 24 sp.

Teredo navalis.

Teredo clava, Coromandel.

Sub-genus. Teredina, *fossil*.

PHOLAHEE, HIND. A thorny tree, which does not grow to a very great height. Wood of

the young tree white, of the old dark coloured, especially the heart-wood, tough and durable; used for cart wheels and sugar mills. The branches of the tree are used for fences. Length of tree to first branch 5 feet, and girth 3 or 4 feet.—*Dr. Campbell*.

PHOLIDOTA ARTICULATA, a white-flowered species of pholidota, is not rare in the suburbs of Maulmain.—*Mason*.

PHOLLORNIS SONNERATII, see *Phoenix cophaus curvirostris*.

P'HOOL, HIND. A flower.

P'hoool charhana, alias Zecarut, or Teeja, a mahomedan funeral ceremony.

P'hoool kee chuddur, HIND. A covering of flowers.

P'hoool pahauna, a mahomedan ceremony.

P'hoool ka tubuq, the fairy flower tray.

P'hoool soongnee, any sweet-scented flower, enclosed in a piece of cloth for the bride to smell.

Phoolcl-ka-tel, an odoriferous oil made by placing sweet-scented flowers, in three or five successive patches, over gingelly oil seed, and then expressing the oil. The best is sold at 1½ rupee for two pounds.—*Herklots*.

PHOOL-KOPI, BENG. Cauliflower. *Brassica oleracea*, B. cauliflora.

PHOQLOHA, ? *Pongamia*.

PHOOLSHAHAR is situated about fifteen miles from Poonah, near the high road to Ahmednuggur, it is on the banks of the Beema, and is remarkable for its salubrity.—*Malcolm's Government of India*, p. 85.

PHOOL-SHOOLA, HIND. *Æschynomene aspera*.

PHOOL-SOLA, BENG. *Æschynomene aspera*.

PHOONTEE, BENG. *Cucumis momordica*.

PHOOT or Phooti, HIND. *Cucumis momordica*, Field cucumber. A wild species of cucumber sown generally in the fields amongst jawari, and is something between the melon and cucumber; it keeps for a long time if not too ripe and would be valuable as a store vegetable for sea.—*Riddell*.

PHOOTANAY, or Poothanee, parched Bengal horse-gram.

PHORMIUM TENAX, the Koradi or Hara-keke, or New Zealand Flax plant. There are several varieties of this plant, which yield flax of varying degrees of fineness. It is a plant likely to thrive on most of the lower hill ranges of British India and to prove especially suitable for culture on parts of Coffee Estates, in which the coffee has died out. The fibre, or flax, of this plant when well prepared is superior in strength and equal in other respects to European flax, so that it seems very desirable that its culture should be encouraged. Dr. T. von Hochstetter's 'New Zealand' gives the compa-

PHORMIUM TENAX.

itive tenacity of New Zealand flax, according to Dr. Lindley as follows :—

Silk.....	34	European flax	16
New Zealand flax ...	23	" hemp ...	11

The Phormium is a flag-like plant with sword-shaped leaves, and bears its flowers on a stalk like the American aloe. The flower contains a sweet juice much liked by children, which is collected by the natives in their calabashes to the extent of $\frac{1}{2}$ pint from a plant. At the root of the leaves a gum-like substance is found, which serves the Maoris as a substitute for sealing-wax and glue, and is also eaten. The pith of the dried flower stalk when ignited grows like tinder, and is used as a slow match to carry fire on a journey. The leaf is applied to various purposes. When green it is used for writing on, the characters being engraved with a sharp-edged shell. Split and cut into strips, it serves instead of cords, strings, ropes, straps, &c., and as a means of binding is indispensable to the natives in building huts and canoes. The green strips of the leaves are plaited by the women into neat baskets, which at dinner serve as plates and dishes; while the men make lines, nets and sails of them. They also extract the fibre, dye it of various colours, and thus get material for mats and garments. The plant covers millions of acres in New Zealand, growing spontaneously on any kind of soil, moist or dry, and in any locality, high or low. It however attains its greatest luxuriance in moist alluvial soil. The leaf in structure resembles that of the Agave. The separation of the fibre may be effected by means of maceration, or mechanical force applied so as not to injure the bast-cells, and sometimes a process combining both these means is employed. The natives who use only the upper part of the leaf and only on one side of it, clean the fibre by scraping off the parenchyma with a shell. The quantity prepared by them is very small, and the government of New Zealand being impressed with the great value of the flax as an article of export, offered some years ago a reward of £4,000 for a machine that would clean the fibre rapidly and effectively. In a small factory near Nelson the process employed was to boil the leaves in lyewater, then to dry and twist them into a thick rope, after which they were passed between ribbed wooden rollers, until the fibre was laid bare in a tolerable state of purity. The dried and bleached produce thus prepared was sold for £25 per ton. In 1860, the Rev. Mr. Purchas invented a machine for cleaning the flax, and the samples produced by it leave no room for improvement as regards purity of fibre. It is very simple, consisting essentially of a large solid cylinder or drum of hard wood, revolving and so put together that its surface presents the cross section of the

PHOSPHORESCENCE.

wood. Above it are a number of perpendicular iron plates grooved on their lower edges which being raised descend in succession of their own weight. The green leaves are passed between the drum and the iron pounders, when the action of the latter, aided by a stream of water, separates and cleans the fibre. A steam engine of 8 horse power works the machine, which will clean 1 ton of fresh leaves, yielding 3 cwt. of flax per day. It has been tried on other fibrous plants and found equally suited for the Agave, Manilla hemp and pine apple.—*Dr. Hochstetter, quoted by George Bidie, M. B., Ootacamund, 28th July 1868.*

PHOSPHORESCENCE, the phenomenon of phosphorescence, says Dr. Hooker, is very conspicuous on stacks of fire-wood. At Darjeling, during the damp, warm, summer months May to October, at elevations of 5,000 to 8,000 feet, it may be witnessed every night by penetrating a few yards into the forest, at least it was so in 1848 and 1849; and during Dr. Hooker's stay there, billets of decayed wood were repeatedly sent to him by residents, with inquiries as to the cause of their luminosity. It is no exaggeration to say that one does not need to move from the fireside to see this phenomenon, for if there is a partially decayed log amongst the fire-wood it is almost sure to glow with a pale phosphoric light. A stack of fire-wood, collected near Mr. Hodgson's cottage, presented a beautiful spectacle for two months (in July and August), and on passing it at night, Dr. H. had to quiet his pony, who was always alarmed by it. The phenomenon invariably accompanies decay, and is common on oak, laurel, (*Tetranthera*), birch, and probably other timbers, it equally appears on cut wood and on stumps, but is most frequent on branches lying close to the ground in the wet forests. He had reason to believe that it spreads with great rapidity from old surfaces to freshly cut ones. That it is a vital phenomenon, and due to the mycelium of a fungus, I do not, he says, in the least doubt, for I have observed it occasionally circumscribed by those black lines which are often seen to bound mycelia on dead wood, and to precede a more rapid decay. I have often, he adds, tried, but always in vain, to coat mycelia into developing some fungus by placing them in damp rooms, &c. When climbing the mountains, I frequently caused the natives to bring phosphorescent wood into my quarters, the pleasure of watching its soft undulating light, which appears to pale and glow with every motion of the atmosphere; but in this difference of intensity, it presents a change in appearance night after night. Cold, heat, and dryness soon dissipate it; electricity I never tried. It has no odour, and a dog, who had a fine sense of smell, paid

PHOTINIA GLABRA.

head when it was laid under his nose. As far as my observations go, this phenomenon of light is confined to the lower orders of vegetable life, to the fungi alone, and is not dependent on irritability. I have never seen luminous flowers or roots, nor do I know of any authenticated instance of such, which may not be explained by the presence of mycelium or of animal life. In the animal kingdom, luminosity is confined, I believe, to the Invertebrata, and is especially common amongst the Radiata and Mollusca; it is also frequent in the Entomostracous crustacea, and in various genera of most orders of insects. In all these, even in the scutulariae, I have invariably observed the light to be increased by irritability in which respect the luminosity of animal life differs from that of vegetable. Phosphorescent matter, is secreted or emitted at will by an infinite number of crustacean and molluscous animals with which the ocean abounds, but has been observed to obtain also in a species of shark, and in the glow-worm, fire-fly, and the luminous centipede, *Geophilus fulgens*, one of the myriapoda. It also exists in some fungoid plants a species of *Agaricus* in the Australian woods is vividly luminous, and is described by Dr. Hooker as occurring at Darjeling. The *Pyrosoma atlanticum*, from three to four inches long, is composed of an aggregation of small tunicaries, and produces a powerful light on being disturbed. Medusae possess luminous powers. The *Salpae* are luminous. The *Squalus fulgens*, or luminous shark gives out a shining light like that of the pyrosoma. Dr. Bennett, found the surface of the water become brilliantly phosphorescent, when his boat struck on a coral reef at Thur bay in the island of Rotuna. One of the pyrosoma, a luminous aggregate tunicated mollusk, has been found floating in great numbers and little minute points, apparently of a jelly-like substance, is found on the Australian coast, similar to those which on the coasts of England have been called nactiluca.—*Bennett, pp. 64, 69; Hooker's Him. Jour., Vol. ii, pp. 150-52.*

PHOSPHORUS PILLS for destroying rats, consist of Hog's lard ground up with cocoanut and phosphorus made into paste. This forms the most certain bait and poison combined to destroy rats, care must be taken in mixing the phosphorus, of which very little suffices.

PHOTY, BENG., see Dacca.

PHOTINIA DUBIA. In Nepal they use the bark of *Photinia dubia* or *Mespilus bengalensis* for dyeing scarlet, see Dyes.

PHOTINIA GLABRA, is common in China and ornamental. It is a noble evergreen, which in the winter becomes covered with fleshy red berries.—*A. Res. among the* p. 51.

PHULA DOLA.

PHOTINIA SERRATIFOLIA, McClell.

Doukyat, BURM.

Found in the neighbourhood of Rangoon and along the banks of the streams in the Rangoon districts, in the direction of the teak forests. Wood red, adapted to cabinet making: The leaves of this plant are used for a green dye. Voigt mentions *Photinia* (*Mespilus*) *Bengalensis*, *Wallich*, as a small tree of Nepal, the Khasya hills, Assam and Chittagong; and *Photinia eugenifolia*, *Lindl.*, as a tree of the Khasya mountains: their woods are not known.—*Dr. McClelland, Voigt.*

Kirga nelli, " MALAC.	Yetta ooserekee, "

A common weed, flowers sessile, capsules dull, scabrous, young plants deeply dark red. The white root, bitter leaves, and tender shoots of this plant, are all used in medicine by natives of India, who consider them as deobstruent, diuretic and healing, the two first are generally prescribed in powder or decoction, in cases of an over-secreted, acrid bile and in jaundice, an infusion of the latter together with vendium seed, is supposed to be a valuable remedy in chronic dysentery. The root is bitter and astringent, and according to many writers, a powerful diuretic, used in several maladies—*O'Shaughnessy*, p. 55 ; *Ains. Mat. Med.*, p. 83.

PHYLLANTHUS POLYPHYLLUS, *Willd.*

A very common shrub or small tree in the northern parts of Ceylon.—*Thw. En. pl. Zeyl.*, p. 282.

PHYLLANTHUS RETICULATUS.—? A shrub of the Coromandel side of India, the

PHYLLIDIADÆ.

Konkans, and Bengal, with a white and durable wood employed by the hill people for various economical purposes. It is frequently employed for ornamental hedges. Cattle eat the leaves.

PHYLLANTHUS RHAMNOIDES, *Retz.*
Syn. of *Melanthesa rhamnoides*, *Retz.*

PHYLLANTHUS SIMPLEX, *Retz.*, *Roxb.*
Oochie userekee, *TEL.*

Fresh leaves, flowers, and fruit, with cummin seeds and sugar are made into an electuary, and given by the natives as a remedy for gonorrhœa; fresh leaves bruised with buttermilk are used to cure the itch.—*Roxb.*, iii, p. 654; *O'Shaughnessy*, p. 552.

PHYLLANTHUS SIMSIANUS, *Wall.*, also *Phyllanthus turbinatus*, *Roxb.* Syns. of *Melanthesa turbinata*, *R. W.*

PHYLLANTHUS VELUTINUS, *Mull.*
Syn. of *Glochidion velutinum*, *W. Ic.*

PHYLLANTHUS VIROSUS, *Roxb.*
Fluggea virosa, *Roxb.*

Among the Circar mountains, where this chiefly grows, it is frequently a middle-sized tree. In the forests of the low countries it is much smaller or only a large shrub. It flowers during the hot and beginning of the wet season. The bark is a strong astringent and possesses the power of intoxicating fish, when thrown into the water where they are, which, like the berries of *Menospermum cocculus*, renders them easily taken.—*Roxb. from Rohde MSS.*

PHYLLANTHUS URINARIA, *Linn. ?*

Urinaria indica spinosa, *Burm.*

Herba macroris rubra, *Rumph.*

Jeru kirganelli, Malcal of *Rheede*.

PHYLLANTHUS VITIS IDÆA, *Roxb.*

Melanthesa rhamnoides *Retz.* | Khaton, nirouri, *Rh.*
Hunkata jooli, BENG. | Yerrapoorogoodoo, *TEL.*

This is found wild in every part of India, and seems to thrive well in all soils and situations, but amongst the mountains, it grows to be a tree; whereas in the low lands, it is generally a large shrub. It flowers and produces fruit all the year round. The wood is white, hard and durable. The hill people employ it for various economical uses. Cattle eat the leaves. In drying for a hortus siccus they always become very black: it is frequently employed for ornamental hedges in gardens for which end it is well chosen, as its thick evergreen foliage and constant succession of beautiful red berries give it a pretty appearance.—*Roxb.*; *Rohde*.

PHYLLIDIADÆ, a family of molluscs.

Phyllidia, *rec.* 4 sp.

Diphyllidia, Syn. *Pleurophyllidia*, *Linguella*, *rec.* 4 sp.

PHYMATEA PUNCTATA.

PHYLLIUM SICCIFOLIUM, Walking leaf insect.

PHYLLOCLADUS TRICHOMANOIDES, is the Sanekaha or Tawaiwai or Pitch-pine timber tree of New Zealand.

PHYLLOPNEUSTE OCCIPITALIS, *Blyth Jerdon*. This bird was known from a specimen procured in S. India by Mr. Jerdon.—*Beng. As. Soc. Jour.*, Nov. of 1854.

PHYLLOORNINÆ, a sub-family of birds comprising 3 gen. 12 sp., viz. 7 *Phyllornis*; 4 *Iora*: 1 *Irena puella*.

stylicornis, *Edws.*, Indian ocean.

PHYMATEA PUNCTATA. This large, well known, beautiful locust, has a scarlet abdomen and yellow and bronze above. Its ravages in Ceylon are not continuous in the coffee tree, but are occasionally very annoying. A swarm settled on a field of one year old coffee and gnawed the bark off the stems, causing them to throw out many shoots and permanently disfigured five per cent. of the trees. They do not touch the Illuk grass, *Saccharum konigii*, *Retz.*, but seem only to attack cultivated plants and trees. At Tangalle they destroyed tobacco plantations, and at Matillee in Kandy the native grain crops were injured by these locusts. The larvæ and pupæ are as destructive as the

PHYSALIS ALKEKENGII.

perfect insects, but this seems, fortunately, the only species of locust that does any real injury in Ceylon, and this injury is in importance not to be compared with that done by other species in other countries.

PHYOO, BURM. A tree of maximum girth 1½ cubits, and maximum length 17 feet. Abundant in Tavoy and Mergui, also in less abundance in Amherst province. When seasoned, it floats in water. It has a tolerably good strong wood, but not with much tenacity of fibre.—*Captain Dance.*

PHYSA, a genus of molluscs.

PHYSALIA, one of the Acalepheæ, its filaments touching the skin, impart a stinging pain, *Figuiér.*

PHYSALIA CARAVELLA, the Portuguese man of war.

PHYSALIA PELAGICA, *Linnaeus*, the Portuguese Man-of-War, it is the *Holothuria physalis* of *Linnaeus*. It is moved along the surface of the water by an inflated oblong bladder, which catches the wind, and underneath the bladder are many tentacula which sting severely.—*Bennett's Gatherings.*

PHYSALIA UTRICULUS, the Portuguese Man-of-War, has a large air vesicle or bladder generally raised above the surface of the water and has purple and azure hues for the lower surface of its body having many sucking tubes and long tentacles, in blue and violet which can be extended and can seize fish.—*Hart.*

PHYSALIS ALKEKENGII, the Winter-cherry, is a native of Europe on exposed hills, and of Japan. The corolla is a dirty white; the calyx reddish-yellow, inclosing a red berry. The fruit of this plant was well-known to the ancients, and is described by *Dioscorides*. In England, however, the fruit is seldom eaten, and the plant is cultivated chiefly on account of its appearance. In Arabia and Armenia, Spain and Germany however the berries frequently supply the place of other eatable fruits. They have a sub-acrid and not unpleasant flavour, but the persistent calyx with which they are invested is very bitter. *Ray* speaks of these berries as a preventive of gout, and others have extolled them as diuretics, and recommended them in the treatment of dropsy. The *Physalis alkekengi*, having some repute as a febrifuge, *MM. Dessaignes* and *Chautard* analysed it, and succeeded in procuring a bitter substance, which they called *Physaline* forming a light white powder with a very slight shade of yellow, leaving in the mouth after a time a very marked taste of bitterness. This substance does not seem to have been used medicinally, nor has its value, if any, been ascertained. Were it otherwise it might be well to examine *Physalis flexuosa* of British India, used in native medicine as stimulant and diaphoretic. *Honig-*

PHYSALIS FLEXUOSA.

berger, p. 324, tells us that its fruit (*Halicacabum*), the winter cherry, is what the easterns call *Kagnuj*, which the British apply to *Physalis flexuosa* or *somnifera*, as this is the name of the plant in the lower parts of *Hindoostan*, in Bengal? The winter-cherry is used by the *Hakims* as a diuretic, and in ulceration of the urinary bladder. It is said to be purgative and is much used in veterinary medicine. The winter-cherry is now regarded as useless.—*Eng. Cyc. ; Ind. Ann. Med. Sci. for April 1856*, p. 384; *Honigberger*, p. 324; *Hogg*, p. 551.

Asgand'h,	HIND. Agsend,	PANJAB.
Ashwa-gandah,	"	

This plant is commonly found all over India, the roots are employed medicinally, and are considered good in rheumatic and dyspeptic disorders, especially those accompanied by flatulency: they are of a warm nature, calculated to promote all the secretions. The root is not given alone; but is combined with other medicines and mesaliks. The *Punjabees* call the plant *agsend* not as stated by so many authors as also in the *Bengal Dispensatory*, *Agsend*. *Agsend* (*Ysgund*) *Nagowri*, is a root official with the native doctors in the *Punjab*, and is imported from *Hindoostan*. The seeds used by *Honigberger* under the name *Physalis flexuosa semina*, were not the seeds of the *Lahore* plant, but had been imported from *Mooltan*. They are kept by the druggists, who call them *Panir ke bij*. *Piddington* states that *Paniru* is *Physalis flexuosa*. *Panir* is the Persian name of cheese, and as these seeds are employed in the coagulation of milk for making cheese, the derivation of its name is palpable. The plant which yields these seeds grows on the west side of the *Indus* river. The leaves which are very bitter, are used as an infusion by the *Lohana* in fever. *Galium verum*, *Linn.*, was formerly used in Europe for the coagulation of milk. Its flowers are yellow, those of *Paniru* not known. The fruit of *Physalis flexuosa* is accounted diuretic, and the root and leaves powerfully narcotic, the latter are used in India as a poultice to inflamed tumors. Common at *Ajmere* the roots are sold by *punsaris*, and are considered stimulating and diaphoretic.—

PHYSALIS SOMNIFERA.

Irvine's, Gen. Med. Top. pp. 123, 183; Honigberger, p. 324.

PHYSALIS PUBESCENS, Downy winter-cherry, is a native of America cultivated in the East Indies. The whole plant is densely clothed with down. The corolla is yellow marked with five round brownish-violet spots at the throat. The berries are yellowish when ripe; they are called gooseberries, or Brazil gooseberries, and when preserved with sugar make an excellent jam. It is the Camara of Brazil.—*Eng. Cyc.; Genl. Med. Top., p. 183; Mason.*

Peru winter cherry,	"	Pambudda,	"
Brazil goosoberry,	"		"

The winter-cherry plant, commonly called Cape gooseberry or Brazil cherry, grows luxuriantly in a good soil. The seed should be sown at the commencement of the rains. The young plants when about six inches high should be set out in rows at least two feet apart from each other, sufficiently wide apart, in fact, to allow the gardener to pass easily between them. They may be grown either on sticks or on trellis, and should be carefully pruned. The young shoots bear the finest fruit, and if carefully attended to, will bear almost all the year round,—the excellence and abundance of the fruit well repaying for an extra care bestowed on the cultivation of the plant. Being of easy culture, it is hardly known to what a state of improvement this apparently worthless fruit may be brought. Produced under an improved method of cultivation, it is a most wholesome and useful fruit; none more so for tarts, or even for dessert, and for making jam or preserve. After seeing the common fruit, grown without care or attention, one would scarcely credit the size of that produced under proper and careful management. The bush should every now and then be carefully pruned, cutting out the old wood, as the new shoots provide the finest flavoured fruit.—*Riddell.*

PHYSALIS SOMNIFERA, Nees. var. P. Flexuosa, Linn., Roxb., W. Ic., Rheede, Wilde.

Usgand, Kaknuj,	HIND.	Pilli vendram,	"

A native of rocky places on the sea coast of the south of Europe and the East. Grows in Bengal and on the coasts of India. Is used in medicine. It has several shrubby branched stems, round and downy. The leaves are in lateral pairs, short-stalked, ovate, downy, and

PHYSOLOBIUM.

from two to four inches long. The flowers are axillary, subsessile, small, crowded, and of a greenish-yellow or white. The berry is red and smooth, and about the size of a pea. This plant is the *Στρυχνοςυπνωτικος* of Theophrastus ('Hist. Plant,' 9, 12); and the *Στρυχνοαλικάκαβον* of Dioscorides (4, 72). It is reputed to be narcotic, diuretic and alexipharmic. The leaves steeped in oil are in India applied to inflammatory tumours, and they are used in a similar way in Egypt. Kunth recognised this plant in Egyptian mummies.—*Eng. Cyc.; O'Shaughnessy.*

PHYSETER GIBBUS, Schreber, P. bonnaterre and P. macrocephalus, Linn. Syns. of Catodon macrocephalus.

PHYSIC-NUT TREE, *Jatropha curcas*. The leaves warmed and rubbed with castor oil are used as a poultice to hasten suppuration; seed excessively drastic. The milky juice boiled with oxide of iron makes fine black varnish, the juice dyes linen black, the embryo is said to be the source of the purgative element, and that by removing the embryo the nut becomes bland and alimentary; MM. Fee and Humboldt support this opinion. The physic nut is a powerful cathartic, one seed, or three or four drops of the expressed oil, being a sufficient dose. In the Dekhan, this plant is used as a hedge from its easy growth; it flowers in the rains.

Physic-nut oil.

Jangli erandi ka tel, HIND.	Adavi-amada-poo Noonay,
Kaat-amunak, TAM.	TEL.

A beautiful pale yellow oil is procured from the seeds of the angular-leaved physic-nut, and it is used by the natives in medicine and as a lamp oil. About 700 tons of this oil was imported into Liverpool in 1850 from Lisbon, for the purpose of dressing cloth, burning, &c. It has been imported into England, as a substitute for linseed oil. The colour is somewhat paler than the best linseed oil. It can be obtained in some parts of the country where it is plentiful, for little more than the cost of manufacture. It is now chiefly used in lamps. At the Madras Exhibition of 1855, a light straw-coloured specimen was shown by Lieutenant Hawkes and several good but rather high-coloured samples from the Tanjore and Travancore Local Committees and the Madras Tariff.—*Mason; O'Shaughnessy, p. 558; Simmonds; Riddell.*

Badar; Budar,	KASHMIR	Pandrai kulre, "
Spruce fir,	Eng	Bajur, TR.-IND.

This is a common plant of Hazara, Murree and Kaghan, and is found in the Sutlej valley between Rampur and Sungnam at an elevation of 8,000 to 11,000 feet. The timber is not so much valued as that of the other pines, but is used for shingles in roofing, being cleft. It is a fine straight tree, with short horizontal or drooping branches, and its leaves very variable in length. Dr. Stewart says the two varieties have by some been called species but they probably depend on climate, and seem not to be very constant or well marked. It frequently forms dense forests at or near the highest belt of arboreous vegetation up to the Indus. Griffith found it in Kaffiristan and Bellew collected it near the Sufed Koh, Trans-Indus. It attains a great height (though he had nowhere seen it up to the 200 feet mentioned by Hoffmeister). Hooker mentions a tree in Bhotan of 30, and Madden one of 32 feet girth. The fibres of the trunk are often twisted and the wood is white, soft, coarse-grained, and rots readily when there is much moisture, this is one of the least valued of Himalayan conifers. Even on the Beas, however, it is said to last as shingles for two or three and under cover for five or six years. In Kashmir, Vigne

states that it is used for door frames, and in the drier climates of Kanawar and Lahoul it is a good deal used. And in Murree, where the rainfall is smaller than to the east, and where there is a dearth of the better timbers, this is frequently used for shingles and indoor work even in European buildings, and is found to last fairly well. In parts of the Jhelum basin the twigs and leaves are much used as fodder. To non-botanical eyes, says Mr. Powell, there is a kind of resemblance between this tree and *Abies smithiana*, in their straight growth and rugged style of foliage; but on closer inspection the difference is great—the *A. smithiana* has a tassel-like pendulous style of branch, unlike the crisp, rugged boughs of Webb's pine: the leaves of Smith's pine are green, those of Webb's besides being much shorter, are dark-green and white underneath.—*Cleg-horn's Punjab Report* p. 63; *Lt.-Col. Lake's Jullundur Report*, quoting *Balfour*, p. 189; *Mr. Barnes' Kangra Settlement Report*, para. 145; *Dr. Thompson's Travels in Western Himalaya and Tibet*, p. 271; *Dr. J. L. Stewart's Punjab Plants*, p. 224.

PICKLES.

PICKLES.

Achar, HIND.

Pickles are largely made and used by the natives of the East Indies and are largely imported for European consumption. The mango, and the tamarind, with capsicum, salt, spices and sugar, in vinegar, are the more common substances used. In an examination of the European pickles by Dr. Hassall, he found "Girkins," on close examination, often turn out to be but shrivelled or sliced cucumbers; the "young tender beans" to be old and tough; the "cauliflowers" to have run to seed, and the "red cabbage" to be nothing more than white cabbage turned into red by colouring matter, as a dyer would change the colour of a dress; further, that amongst the vegetables, not unfrequently employed for the purpose of pickle-making, were some which do not enter into the calculation of the epicure, as vegetable-marrows,—which, when cut into pieces, form a very respectable imitation of cucumbers,—and sliced turnips, the identification of which would be apt to puzzle even a botanist as well as certainly all those who are uninitiated in the secrets of a pickle-manufactory. The vinegar used for pickling is of a very weak description, the percentages of acetic acid ranging between 1.48 and 2.91. Vinegar of good quality ought to contain from four to five per cent. of pure acetic acid. Nineteen out of twenty of the vinegars submitted to analysis, poor as they were, yet owed a portion of their acidity to sulphuric acid, the amount of which varied, in the different samples, from 38 to 2.52 in the 1,000 grains; the largest quantity of this acid being detected in the vinegars in which the red cabbages were pickled. In sixteen different pickles analysed for copper, that poisonous metal was discovered in various amounts: two samples contained a small quantity; eight rather much, one, a considerable quantity; in one, copper was present in highly deleterious amount; and in two, in poisonous amounts. Pickles which contain the largest quantity of copper, are those which consist entirely of green vegetables, as girkins and beans. Another form of pickle is "chatni," of which there are many varieties, composed of mango, tamarind, with red pepper, sambhar salt, spices, sugar, vinegar, and a number of other ingredients, varied according to the taste of the maker, or according as he wishes to produce a hot, sweet acid, or pungent "chatni." All these articles are used as relishes by natives with their dhol and rice and chapatties. The native method of making pickles is very different from the European pickles of Crosse and Blackwell, but are prepared to last only a few days, and are consumed as soon as made. Pickles are prepared with vinegar, native vinegar being generally sugar-cane juice fermented

till it turns acid.—*Hassel, Food and its adulterations*, p. 383; *Powell*.

PICKTHA, an Indian and Burmese weight of 140 tolas, about $3\frac{1}{2}$ pounds.—*Simmond's Dictionary*.

PICRORRHIZA KURROOA, *Royle*.

Veronica lindleyana. Wall., Cat.

Tita, Bitter root,	BENG. Kurrooa, ENG. Moon-ling,	PANJAR. Tib.
	The root.	
Karru, Karwa, Pathan bed,	PANJAR. HIND. Kali kootkee, Kaur,	HIND. "

This plant grows in Gosainthan, Kemaon, and Kedarkanta, on the hills of Hindostan, as also in the Cashmerian mountains. It is a fleshy rooted perennial. Flowers sessile, deep blue, in dense spikes. The root is intensely bitter, and used as a medicine in India. The root is much in use at Lahore; but more in veterinary than in human medicine. Tita or teeta is a general name given in Bengal to the roots of bitter herbs, but is given in East Nepal and in the Yaloong valley, to the Picrorrhiza, which is used as a febrifuge: it is a plant allied to speedwell, and grows at from 12,000 to 15,000 feet elevation, and is a powerful bitter, the term kali kootki is applied also to black Hellebore, the *Helleborus niger*, an acrid purgative and poison. It is found in the Sutlej valley between Rampur and Sungnam at an elevation of 11,000 feet. The root is exported to the plains. Its root is one of the regular febrifuges, and is given for ascites and applied in plaster. Part of the karru sold is the root of *Gentiana kurroo* (q. v.), and some of it is possibly produced by other plants.—*Hooker's Him. Jour.*, Vol. i, p. 272; *Cleghorn's Punjab Report*, p. 67; *Powell's Hand-book*, Vol. i, p. 362; *J. L. Stewart, M.D.*; *O'Shaughnessy*, p. 478; *Dr. Honigberger*, p. 325.

PICTURE PLANT, *Graptophyllum hortense*, *Justicia picta*: variegated leaf: blood-red leaf. One variety has variegated leaves, and the other deep purple.

PICUL, a measure of weight in Batavia, it is 135 lbs., 10 oz.; in Japan, 131 lbs.; in Malta, $1\frac{1}{4}$ cwt. (140 lbs.), ordinarily in China, lbs. 133 $\frac{1}{2}$.—*Simmond's Dict.*

PICUS, a genus of birds. In China there is the *Picus cabanisi*, and on the ranges of Nepal, *P. majoroides*; *P. ocellatus*, *P. shorei* and *P. squamatus*, occur on the higher ranges of the Himalaya. *P. tiga*, *Horsf.*, occurs in the E. Archipelago. *P. shoui* is called the three-toed wood pecker, other species are, *Picus gymnophthalmos*, *P. brunneifrons*; *P. cathpharius*; *P. himalaynus*; *P. macei*; and *P. mahrattensis*. See Birds.

PIDDINGTON, Henry, long Coroner in Calcutta, well known for his numerous contributions to the literature of storms. He was one of the few who escaped from the massacre of Amboyna. During the latter years of his life, his attention was turned to subjects connected with Economic Geology, on which he published various scientific papers; and still more recently to researches on the Law of Storms, the latter requiring an amount of patience and industry which can only be correctly estimated and appreciated by those engaged in pursuits of a similar nature. As the most arduous, so these are likely to prove the most useful of his labours. In the earlier days of his residence in India he was engaged in the culture of coffee and indigo, and the manufacture of sugar, and during that period he contributed various notices on agricultural subjects to the transactions of the Agricultural and Horticultural Society. Among these may be enumerated his papers on the soils best suited for the cultivation of tobacco, coffee, sugar, cotton, and the tea plant; on the manufacture of indigo; the artificial production of new varieties of cotton; on the mode of preparing Manila hemp; on the prevention of contagious diseases amongst cattle; and on the disease called Bosouto, which attacks the cattle of Bengal. He also published, as a part of Prinsep's Useful Tables, a tabular view of the generic characters of Roxburgh's Flora Indica, a work requiring a considerable amount of labour and care in the compilation, and causing a saving of time to the botanical student. But, perhaps, the most useful of his labours in this department was his English Index to the plants of India. This useful manual, was published about A.D. 1830. In 1839 he printed, for private circulation, a treatise on the scientific principles of agriculture considered as a branch of public education in India, which was published in 1854.

PIDGIN or Pigeon, an Anglo-Chinese corruption for the word business, *Colld.*

PIE, HIND., a small money of British India the third part of a pice, and 12 of which go to one anna, of value 1½d.—*Simmond's Dict.*

PIE, or Magpie, the genus *Dendrocitta*, *Gould*, called also tree crows; are of strictly arboreal habits; the species are:

- D. rufa*, *Scopoli*, the common Indian magpie, all India.
- D. pallida*, *Blyth*, the pale magpie, N. W. Himalaya, Cashmere, Afghanistan.
- D. sinensis*, *Latham*, the Himalayan magpie, all British India.
- D. frontalis*, *McLelland*, the black-browed magpie, all India.

- D. leucogastra*, *Gould*, the long-tailed magpie.
- D. rufigaster*, *Gould*, South Asia.
- D. occipitalis*, *Mull.* Sumatra.

The wandering pies (*Dendrocitta vagabunda*) and (*Dendrocitta rufa*) its ally the red-vented pie (*D. sinensis*) affect the same situations, and although *D. rufa* is not so domestic in habits, and less often met with in the neighbourhood of dwellings, is plentiful in copses and jungles, the black-throated jay is (*Garrulus lanceolatus*, *Vig.*)—*Adams.*

PIG, the ordinary name for the wild and domesticated species of swine. There are many domesticated varieties. The hunt of the wild boar called pigsticking, is a favourite amusement of the British officers in India. They hunt on horse-back and use spears. In northern India with short spears, which are jobbed down on the boar, in the Dekhan with long spears which are held firm in the armpit.

PIGAFETTA. Antonio Pigafetta, the companion of Ferdinando de Magaglianes.

PIG-DEER. The wild boar of Celebes is peculiar, but the Babirusa or Pig-deer, there, has long and slender legs and the male curved upper tusks turned back so as to resemble horns. It feeds on fallen fruits, it is found in the Celebes, in the Sulu islands and in Borneo. There are also 5 species of squirrels, 2 species of Cuscus or eastern opossums.

PIGEON.

Kabootar, HIND.

The pigeons are classed by naturalists in the order Gemitores, the Columbæ of Latham. Dr. Jerdon thus arranges the Gemitores or pigeons.

Fam. Treronidæ.

Sub-fam. Treroninæ, Green pigeons, viz., 2 Treron; 2 Crocopus; 4 Osmotreron; 2 Sphenocerus.

Sub-fam. Carpophaginæ, Fruit pigeons, viz., 2 Carpophaga.

Fam. Columbidae.

Sub-fam. Palumbinæ, Wood pigeons, viz., 2 Alsocomus; 3 Palumbus; 1 Palumbæna; 3 Columba.

Sub-fam. Macropyginæ, Cuckoo doves, viz., 1 Macropygia.

Sub-fam. Turturinaæ, Turtle doves, viz., 6 Turtur

Sub-fam. Gouridæ, Ground doves.

Sub-fam. Phapinæ, Ground doves, viz., 1 Calophas indicus.

Of these sub-families the numbers are in the E. Indies.

Sub-fam. Treroninæ, 5 gen. 3 sub-gen. 23 sp. viz., 3 Toria; 8 Treron; 3 Sphenocerus; 4 Ptilinopus; Carpophaga.

Sub-fam. Columbinae, 7 gen. 21 sp. viz., 2 Alsocomus; 3 Palumbus; 2 Columba; 4 Macropygia; 2 Geopilia; 7 Turtur; 1 Chalcophaps.

Sub-fam. Gourinæ; 1 gen. 1 sp. viz., 1 Calasena nicobarica.

Pigeons, doves and turtles are abundant in southern Asia and the Indian Archipelago. Jerdon names *C. intermedia*, *C. rupestris*; *C. leuconota* as occurring in India, and *C. aromatica*, *C. coronata*, and *C. carpophaga* are now referred to other genera. The most common in India of the genus is the *Columba intermedia*. Of pigeons and doves, there are, at least in Ceylon a dozen species. Some live entirely on trees, never alighting on the ground; others, notwithstanding the abundance of food and warmth, are migratory, allured, as the Singhalense allege, by the ripening of the cinnamon berries, and one species is known in the southern provinces as the "Cinnamon dove." A very beautiful pigeon, peculiar to the mountain range, discovered in the lofty trees at Newera-ellia, has in compliment to the Viscountess Torrington, been named *Carpophaga torringtonæ*.

Columba intermedia,—Blue pigeon.

C. livia var. *Blyth.*

Pagoda pigeon,	ENG.	Kovilpora	TAM.
Kabutar,	HIND.	Gudi-purai,	TEL.
Parivi,	MAH.		

The blue pigeon is the most common in India, of all the pigeons. They congregate in large numbers and breed wherever they can find suitable spots, on pagodas, mosques and tombs. The common blue pigeon differs from the *C. livia* of Europe, only in having an ash coloured, instead of a pure white rump. The *C. livia* of Europe or rock pigeon with its subspecies is the parent form of all domesticated pigeons. Of these, there are at least 150 varieties.

They are four groups, consisting of, Poulters.

First. The German, Dutch, and English.

A second group, includes the Kali-par, Murassa, Bussorah, Dragon and English carrier; the Bagadotten, Scanderoon Pigeon, Cygne Rients, the Tronso and the Bank.

The third group, includes the Java and English fantail, the Turbit and African owl; the Persian Lotan, common and short faced tumblers; the Indian frill back and Jacobin.

The fourth group, includes the Dove-cot pigeon, swallow, spot, nun, English frill back, Laughler and Trumpeter.

Columba livia, is the Rock dove of Europe, North Asia to Japan, N. Africa; abundantly replaced in India by the barely separable *C. intermedia*.

Columba aromatica of Latham, the Vinago aromatica, is of a mild and timorous disposition, and is generally seen in flocks or societies ex-

cept during the period of reproduction when they pair, and retire to the recesses of the forest. The nest is simple, and composed of a few twigs loosely put together, and the eggs are two.

Carpophaga forsteri, a fruit pigeon of N. Celebes.

Carpophaga oceanica, one of the nutmeg pigeons; many of both sexes are furnished with a large, round, fleshy caruncle on the bill, at the base of the forehead: this is said to be present during the breeding season only.

Carpophaga oceanica, Selby, is the *Columba oceanica* of Lesson, and according to Lesson is the Moulouesse, or Mouleux, of the natives of Oualan, it approaches the Nutmeg pigeon, *Columba (Carpophaga) onca*, very nearly, but differs from it in size, being one-third less, and in the distribution of some of its colours. "The Nutmeg pigeon lives more particularly in the eastern Moluccas, and especially at New Guinea and Waigiou, while the Oceanic fruit-pigeon is abundant in the little isle of Oualan, in the midst of the great archipelago of the Carolines, and seems to exist in the Pelew islands, it may possibly spread over the Philippines and at Magindanao."

Geophilus nicobaricus, is the *Columba nicobarica* of Latham, the *C. gallus* of Wagler. It inhabits the Nicobar islands, Java, Sumatra, and many of the Moluccas. Mr. Bennett, who saw them in Mr. Beale's aviary at Macao, says that they were usually seen perched upon the trees, even upon the loftiest branches, and adds, that they build their rude nests and rear their young upon trees similar to all the pigeon tribe.

Turtur humilis, the Asiatic pigeon, is somewhat common in the Punjab.

Lophyrus coronatus, is the *Columba coronata* of Latham; *Phasianus cristatus Indicus* of Brisson; *Columbi Hocco*, Le Vaill.; *Colombe Galline Goura*, Temm., Great-crowned Pigeon, Edw., and is a species surpassing in size all the other Columbidae. Total length from 27 to 28 inches. This bird is found in many of the islands of the great Indian group. Not rare in Java and Banda, abundant in New Guinea and in most of the Moluccas. Nest built in trees; eggs two; cooing of the male hoarse, accompanied by a noise somewhat like that of a turkey-cock when strutting. Its food consists of berries, seed, grain, &c. Flavour of the flesh said to be excellent.

The hindoo pandits assert that Siva and his spouse, under the forms and names of Kapot-Eswara (pigeon god) and Kapotesi, dwelt at Meccah. The dove was the device of the old Assyrian empire, because, it is supposed, Semiramis was preserved by that bird. The Meccan pigeons—large blue rocks—are held sacred probably in consequence of the

traditions of the Arabs about Noah's dove. Some authors declare that, in Mohamed's time, among the idols of the Meccan pantheon, was a pigeon carved in wood, and above it another, which Ali mounting upon the Prophet's shoulder, pulled down. This might have been a hindoo, a Jewish, or a christian symbol. The moslems connect the pigeon on two occasions with their faith; when that bird appeared to whisper in Mohamed's ear, and, secondly, during the flight to El Medinah. Moreover, in many countries they are called "Allah's proclaimers," because their movement when cooing resembles prostration. Almost everywhere the pigeon has entered into the history of religion; which probably induced Mr. Lascelles to incur the derision of our grandfathers by pronouncing it a "holy bird." At Meccah they are called the doves of the Kaabah, and never appear at table. They are remarkable for propriety when sitting upon the holy building. This may be a minor miracle.—*Eng. Cyc.*, p. 70-91; *Jerdon's Birds of India*; *Catalogue of Birds Beng. As. Soc.*; *Cat. Birds, India House Museum*; *Burton's pilgrimage to Mecca*, Vol. iii, p. 218.

PIGEON ISLAND, lying 12 miles off the coast of Canara, in lat. 14° 1' N., long. 74° 18' E., is small but high, and visible for 24 miles.

PIGEON-PEA, *Cajanus indicus*, is the seed of the plant called by Linnæus *Cytisus cajan*, and by DeCandolle *Cajanus bicolor*, *Cajanus flavus* and *C. indicus*. It is a pulse highly esteemed by all classes of the natives of India.—*Spreng*; *Eng. Cyc.* See *Cajanus indicus*, Dhol, Tour-ka Dhal.

PIGER, BAL., JAV. Borax.

PIG-IRON. The following is an estimate of the whole production of pig-iron in the world in 1871, in tons of 2,000 pounds. Great Britain, 6,500,000 tons; German Zollverein, 1,350,000 tons; Belgium, 896,000 tons; Austria, 450,000 tons; Norway and Sweden, 280,000 tons; Russia, 330,000 tons; Italy 75,000 tons; Spain, 72,000; other countries 200,000 tons; total, 13,315,000 tons. It will be observed that Great Britain produced about one-half of the pig-iron used in the world.—*Madras Times*, July 16, 1872.

PIG ISLAND. Several of the *Megapodius duperreyi* were seen by Mr. Macgillivray in the Lousiade Archipelago. The natives are dark copper coloured. The hair is nearly all frizzled out into a mop, in some instances of prodigious size. The physiognomy varied much; the nose was narrower and more prominent, the mouth smaller, the lips thinner, the eyes more distant, the eyebrows less overhanging, the forehead higher, but not broader than in the Australian, one man, whose head was shaven had his forehead nar-

row and receding, appearing as if artificially flattened, thereby giving great prominence and width to the hinder part of the skull, and he often observed the same configuration of head combined with dark coloured skin and diminutive stature. None had the artificial prominent scars on the body peculiar to the Australians, or wanted any of the front teeth, but the septum of the nose was perforated to admit an ornament of polished shell, pointed and slightly turned up at each end. The lobe of the ear was slit, the hole being either kept distended by a large plug of rolled up leaf, apparently of the banana, or hung with thin circular earrings made of the ground down end of a cone-shell (*Conus millepunctatus*) one and a half inches in diameter, with a central hole and a slit leading to the edge. A piece of cloth-like substance, the dried leaf of the Pandanus or some palm was used by all passed between the legs and secured in front and behind to a narrow waistband.—*Macgillivray's Voyage*, Vol. i, pp. 189-195.

PIGMY DEER. The Chevrotin or pigmy deer are not much larger than hares.

PIGMY HOG, ENG. *Porculia salvania*, *Hodgs., Hors.*

PIGMENTS. In illustration of the variety of indigenous pigments, says Dr. Cleghorn, I may state that finding my colour-box becoming exhausted, I have been enabled to supply, on more than one occasion, all its deficiencies without difficulty from the natural products of the surrounding forests of the Malabar ghauts, including yellow from the *Garcinia*, blue from various species of indigofera, red and purple from *Oldenlandia umbellata*, *Pupplay chukkay* (*Ventillago*?) and *Vatica laccifera*.

Sardine,	IT.		

Clupea pilchardus, the Pilchard, is said to frequent the coast of Japan, in the latter part of the month of June, and commencement of July. They are taken by the seine nets. When fresh, they are sweet and nutritious, but they are chiefly valued for their oil, to obtain which they are piled up in heaps for 24 hours, are then boiled for some time in sufficient water to prevent their burning, then ladled into strong square presses, and the lever action of a lid presses out the oil. The oil after cleaning is used for lamps and the refuse for manure.—*McCulloch's Com. Dic.*, p. 902.

PILCHI, HIND. *Tamarix gallica*, Syn. of *T. indica*, also *Tamarix dioica*, the tamarisk or Jhau.

PILEOPSIS, a genus of molluscs.

PILEOLUS, a genus of molluscs. See *Neritidæ*.

PILGRIMAGES are made by hindooes very extensively and regarded as very meritorious. Of all the holy cities of the hindooes, Benares takes the first place, but the shrines at Hardwar, in the Himalaya, Dwaraka in Guzerat, Jaganath in Orissa, Panderpoor on the Kistnah, Tripati in N. Arcot, Sri-rangam near

Trichinopoly, and on the island of Ramisseram are all holy places to which many hindoos resort. Of rivers, the Ganges takes the first place, but hindoos reckon five Ganga, viz., the Ganges proper, the Godavery, Kistnah, Cauvery and Tumbudra. The objects of the hindoos in making their pilgrimages are as varied as the human motives, passions and desires, chiefly perhaps to fulfil a vow or to implore benefits, or in penance. Amongst hindoos whom Capt. Burton met, he had seen men who have proceeded upon a pilgrimage to Dwarka, and yet would not receive the brand of the god, because lying would then be forbidden to them. The bulk of the hindoos who make pilgrimages are usually in poverty, and beg from place to place. Many die on the roads, exhausted by the prolonged exertions.

Amongst mahomedans, the principal places for minor pilgrimages are the tomb of Ali called Mash'hid-i-Ali at Nej'f near Cufa; the shrine of Imam Hosein at Kerbela, and that of Imam Raza at Mash'hid in Khorasan, but the tombs of all the numerous imam-zadeh and tombs of holy characters, throughout the country, are visited. The minor pilgrimage of the mahomedan saints of India, is termed a ziyarat, as distinguished from the haj or great pilgrimage to Mecca in Arabia but no mahomedan except the Maliki is bound to pilgrimage without a sum sufficient to support himself and his family. The streets of Mecca, however, abound in pathetic Indian beggars, who affect lank bodies, shrinking frames, whining voices, and all the circumstance of misery, because it supports them in idleness. There are no less than 1,500 Indians at Mecca and Jedda, besides 700 or 800 in Yemen.

Amongst the Christians, Jerusalem in western Asia, and St. Thomé or Mylapore on the Coromandel coast, an outskirt of Madras, are the chief places of resort. An immense concourse of people visit every year, on the 29th Sept. the fountain of St. Michael near Ballynaskellig on the coast of Kerry. Then the feast of St. Michael coincides with the autumnal equinox, and consequently with the sacrifices and the Baal-tinnes of the Druids which also took place at this period. It is related that Arthga son of Cathal, king of Connaught, took the pilgrims staff, and set out for Hiona dia ailithre, on a rock or upright stone, and itriallum, going round. Ailathre used by the ancient Irish is still employed to designate the pilgrimages to Iona, Jerusalem or Rome.

The buddhist pilgrims of Burmah, visit the great Shooay dagon pagoda at Rangoon and the pagoda at Prome. With all of these races, and religionists, hindoos, hebrews, mahomedans, buddhists and christians, the circumambulation of the shrine forms part of the pilgrims' duty.

This was a Jewish practice, it is often mentioned, "walk about Zion, and go round about her, tell the towers thereof."

PILGRIMS, a group of islands about 30 miles from Junkseyon off the Malay coast.

PILGRIMS-TREE, also called Rag-tree, these may be observed throughout Asia, in Egypt and in Africa. They are trees on which raga are suspended, and buddhists, hindoos and mahomedans alike form them. In the peninsula of India, it is usually an Acacia, the common babool tree, *A. arabica*. Burton says that some believe that Mahomed permitted the practice, and explain the peculiar name of the expedition called Zat el Rikaa, (place of shreds of cloth,) by supposing it to be a term for a tree to which his followers hung their ex-voto rags. Huc in his travels mentions that the Tartars worship mountain-spirits by raising an 'obo,' dry branches hung with bones and strips of cloth, and planted in enormous heaps of stones. Park, also, in Western Africa, conformed to the example of his companions, in adding a charm or shred of cloth on a tree (at the entrance of the wilderness), which was completely covered with these guardian symbols. The Tarikh-i-Tabari mentions it as a practice of the Pagan Arabs, and talks of evil-spirits residing in the date-tree.—*Burton's Pilgrimage to Mecca, Vol. i, p. 227.* See Trees.

PILI, Rus. File.

PILI BUTI, HIND. Abutilon indicum.

PILIDION MONTANUM. Above bluish-black, yellow on the sides, with a black spot on each of the 3 lower scales; abdomen banded black and white. Scutæ? Scutellæ 15-15 rows of scales, 15 inches long. Found only on the Neilgherries.

Eugenia pimenta, DC., var. *a. longifolia*.

Myrtus pimenta, Linn., var. *a. longifolia*.

Pimento tree, ENG. | Allspice tree, ENG.

This Mexican and West Indian tree has been introduced into the East Indies. There are several large trees at Madras, but the climate of the Carnatic does not seem to suit them. It flourishes spontaneously and in great abundance on the north side of the island of Jamaica; its numerous white blossoms mixing with the dark-green foliage, and with the slightest breeze diffusing around the most delicious fragrance, give a beauty and a charm to nature rarely equalled, and of which he who has not visited the shady arbors and perfumed groves of the tropics can have little conception. Every leaf when bruised emits a fine aromatic odour, nearly as powerful as that of the spice itself. The tree has been known to grow to the height of from 30 to 40 feet, exceedingly straight. A single tree has frequently produced 50 lbs. of the raw, or 10 lbs. of the dried fruit. The fruit has an aromatic odour, and its taste combines that of cinnamon, nutmeg, and cloves; hence its common name of allspice. The leaves yield by distillation a delicate odoriferous oil, which is said to be sometimes passed off for oil of cloves. The berries are gathered before they are ripe, and spread on a terrace, exposed to the sun for about a week, during which time they lose their green colour, and acquire that reddish-brown tint which renders them marketable. Some planter's kiln dry them. Like many of the minor productions of the tropics, pimento is exceedingly uncertain, and perhaps a very plentiful crop occurs but once in five years.—*Poole's Statistics of Commerce*; *Simmond's Commercial products*; *Catalogue of Madras Agricultural Gardens*; *Madras Exhibition Series Report*; *Voigt's Hort. Sub., Calcutta*, p. 41.

Anesoon ; Sonf,	HIND.	Kuppi chettu,	TEL.

This plant grows in Egypt, Scio, and the Levant, and it is cultivated in Europe for its seed. Aniseed in various forms is much employed in medicine as a stomachic, especially in the diseases of children, and is also used as a condiment among all eastern nations. The seeds are often fraudulently mixed with clay, are liable to spoil by spontaneous fermentation in the packages. They are much richer in essential oil than the majority of the Apiaceæ, 8 lbs. having given 3½ ounces of the oil. Essential oil of aniseed is white, yellowish, a little lighter than water, congealing at 78° Fahr. into a soft mass, sp. gr. 0.985. It is liable to adulteration with spermaceti and several fixed oils, some of which may be detected by alcohol, ally leaving a greasy stain on paper evaporated over a lamp. This oil contains nitrogen according to the analysis of Saussure. It only exists in the pericarp, the interior of the seed yielding a tasteless and inodorous fixed oil. This is often mixed with the essential oil, and is as much an adulteration as if castor or olive oil had been employed. The pure essential oil can only be obtained by distilling the seeds with water. The oil is a good and safe stimulant, and is much used in prescriptions for children suffering from flatulence and colic. *O'Shaughnessy*, pp. 358-59. See Oils.

PIMPINELLA CRINITA, Bois.

Bal ajuain, SUTLEY, RAVI.

A small plant, common in the Salt Range up to about 2,000 feet, and in several of the more arid tracts of the Punjab, Cis and Trans-Indus. —*Dr. J. L. Stewart*, M. D.

PINA, PHILIPPINE. *Ananassa sativus*, Schult.

PINA-CLOTH, an expensive fabric made by the natives of the Philippines from the fibres of the pine-apple leaf, the *Ananassa sativa*; the texture is very delicate, soft, and transparent, and generally has a very slight tinge of pale yellow. It is made into shawls, scarfs, handkerchiefs, dresses, &c., and is most beautifully embroidered by the needle. The process of extracting and bleaching the fibres is exceedingly simple. The first step is to remove the fleshy or succulent side of the leaf. A Chinese, astride on a narrow stool, extends on it, in front of him, a pine-apple leaf, one end of which is kept firm being placed beneath a small bundle of cloth on which he sits. He then with a kind of two-handled plane made of bamboo removes the succulent matter. Another man receives the leaves as they are planed, and with his thumb nail loosens and gathers the fibres about the middle of the leaf, which enables him by one effort to detach the whole of them from the outer skin. The fibres are next steeped in water for sometime, after which they are washed in order to free them from the matter that still adheres and binds them

together. They are now laid out to dry and bleach on rude frames of split bamboo. The process of steeping, washing, and exposing to the sun is repeated for some days until the fibres are considered to be properly bleached. Without further preparation they are sent into town for exportation to China. Nearly all the islands near Singapore are more or less planted with pine-apples, which, at a rough estimate, cover an extent of two thousand acres. The enormous quantity of leaves that are annually suffered to putrify on the ground would supply fibre for a large manufactory of valuable pina-cloth. Fibres should be cleaned on the spot. Fortunately the pine-apple planters are not Malays but industrious and thrifty Bugis, most of whom have families. These men could be readily induced to prepare the fibres, if any merchant offer an adequate price. An elaborate pina-dress embroidered, is often priced at £300 and upwards.—*Simmond's Dictionary; Journal of the Indian Archipelago, No. viii, August 1848, p. 528; Oliphant.*

PINAKOTTE, TAM. Calophyllum calaba.

PINANG, MALAY. Areca catechu.

PINANG—? Bach—? A Penang wood of a brown colour. A large tree, wood used for beams.—*Colonel Frith.*

PINANG. About four hundred miles to the north of Malacca, at the head of the Straits, and separated from the mainland by a channel two miles broad, which forms the harbour, is the island of Pinang, called Pulo-Pinang or Prince of Wales' Island. As seen from a distance out in the Straits, here nearly 200 miles wide, it appears very rugged and mountainous. The highest peak, not far west of the town, is about 2,700 feet high. Government hill adjoining it is about 2,500 feet, and the other hills from 1,000 to 2,000 feet high. They run in chains in every part of the island save the east. It is at the northern extremity of this eastern plain that George Town or Pinang as it is called by Europeans, or Tanjong (Cape) by the Malays, is situated. The island is fourteen miles long by eight broad; it was obtained for a yearly payment of 6,000 dollars from the neighbouring Malay sultan of Queda through the influence of Captain Light, who is said to have married his daughter, and who was appointed the first Governor in 1786. The island then was wild and uncultivated, with only some 20 or 30 inhabitants. It was not till long after, that, for the protection of the harbour, the opposite coast, some 30 miles long by 15 broad, was taken from the same prince for another annual payment of 4,000 dollars. The inhabitants may be divided as at Singapore into Chinese, Kling or Indian races, Europeans, Portuguese and Malays. There are, besides, a few Burmese. The Klings and Chinese are pretty well provid-

ed with wives, but the Chinese, whether married or unmarried, are steeped in vice. There are numerous Joss houses and Chinese guild-halls all over the town. The English Church is an ugly, yellow building, situated but a short distance from the jetty. The Romanist and Scotch Churches adjoin. There is another Roman Catholic Church for the Portuguese and for Chinese converts. The trade after having risen to something considerable in the earlier part of this century, began to decline with the increase of Singapore. Of late years, however, it has shown a tendency to rise again, and while in 1859 it amounted to £3,000,000, in 1860 it was very nearly £4,000,000. The revenue receipts for 1859-60 were 598,111 as follows:—

Land.....	Rs. 37,749	Judicial.....	Rs. 21,330
Excise.....	„ 237,233	Miscellaneous...	„ 301,799

The expenditure during the same period was as follows, Rupees 254,256.

Local charges..	Rs. 212,706	Straits' charges, Rs.	41,550
-----------------	-------------	-----------------------	--------

The surplus of Rs. 343,855 was absorbed in paying the charges for convicts, amounting to Rs. 77,330, and for disbursements on account of the military stationed at Pinang. The imports into Pinang during 1859-60 were estimated at Rupees 15,800,000, and the exports during the same period at Rupees 19,500,000.

By a census of Pinang and province Wellesley, taken in January 1860, the population amounted to 194,772.

Europeans & Eurasians.....	2,071	Bengalese.....	1,098
Malays.....	71,723	Chinese.....	36,222
Klings.....	13,034	Siamese.....	624

Of the above 59,956 resided in Pinang, and 64,816 in province Wellesley. On the opposite coast, the height of Gunong Jerai (Kedah peak, in Malacca) is about 3,894 feet; Gunong Ledang (Mount Ophir) is about 4,320 feet high, at least 1,300 feet lower than the height given by Captain Newbold. The height of the most southern mountain, Gunong Pulai is 2,152 feet. The chief timber trees on Pinang hill are

PIND, HIND. An aphorism.

PIND, HIND., of the upper Panjab, a village; as Pind Bhattian, Pindi Ghail, Rawal pindi.

PIND, HIND. In the Multan division and Derajat, dried dates of *Phoenix dactylifera*.

PINDA. The Pindapata vela, explained to signify the hour of going round to collect the Pinda, which is the name given to the food collected by the Saugata, or Buddha mendicant. The word means a lump or ball of any viands, usually of rice or meal. The seventh gharri, which will be one hour afternoon.—*Hind. Th., Vol. ii, p. 38.*

PIND-ALOO, HIND., the root of a tree resembling *Ricinus communis*. This is boiled and eaten by common people.

PINDARA, plunderers who ravaged India from the middle of the 18th to the earlier part of the 19th century. They were of every origin, but the term was taken from the Beder, or Veddur race, who extend southwards into the Mysore country, where they hold lands. A small body of them dwell on the platform of Raman malay, thirty-seven miles west of Bellary, and there are two small principalities of the Beder race at Zorapore, on the north bank of the river Kistnah. It is from this race, the Baidara Wanloo of the Tiling, that the word Pindarah comes. They are in various stages of civilization, but those in Mysore are perhaps most advanced. The small chiefship at Zorapore was given by Aurungzeb to Pid Naek for aid given at the siege of Bejapore. The descendants of Pid Naek are tall handsome men. The town of Zorapur is in the centre of a rocky amphitheatre, admirably suited for a predatory band. The race eat every creature, even the crocodile and other animals which most nations loathe. They are fond of the chase, and hunt the wild boar with large dogs. In the tract lying between the Mysore and Hyderabad and Mahratta territories, are several

petty sovereignties, such as that of the nabob of Banganapilly, a syud family, in the east of the Ceded Districts. Until 1839, the Pathan nabobs of Kurnool ruled on the right bank of the Tumbudra river; further west, the Reddi chief of Gadwal; the Mahratta chief of Sundoor, one of the Ghorpara family; the kshetria rajah Narapati of Anagoondah, the descendant of the great king Rama of Vijianaggur, who was overthrown by the combination of the mahomedan kings of Golcondah, Kalburgah, Bijapore and Ahmednuggur; the Pathan nabobs of Shahnoor, the Ghorpara chieftains of Gujundurgurh and Akalkot; and, at Ghoorgontah and Beder Shorapore, are descendants of that Beder soldier, Pid Naek, to whom Aurungzeb, for aid given at the siege of Bejapore, granted a small territory in the Raichore doab. The Beder race have only these two small sovereignties. The Beder race in parts of Mysore form a considerable part of the population and have polygarships, and Ceylon has a fragment of a prior stock, called Veddah. Their name is variously pronounced, Beder, Baida, Baidara, Waida, Vedda, Vedar, Veddar, Vedan and Bedan. But they seem to be the race who gave their name to the Pindara plunderers who harassed Central India for nearly 70 years. The Baidar of Beder Shorapore, drink spirits, eat the hog, crocodile, porcupine (*Sarsal*) manis, (Ali) Iguana, bullock, cow, buffalo, cat, rat, bandicoot, (*Mus giganteus*) and Jerboa rat. The Baidara Wanloo, TEL., of Bellary, are mahomedans, and keep numerous little horses which they use for carriage. They are great carriers and have been of use in several military operations. The Pindari are mentioned in Indian history as early as the commencement of the eighteenth century; several bands followed the Mahratta armies in their early wars in Hindustan. Coleman tells us that they were divided into durrha, or tribes, commanded by sirdars, or chiefs, and people of every country and of every religion were indiscriminately enrolled in this heterogeneous community, a horse and sword being deemed sufficient qualifications for admission. A common interest kept them united: some of the chiefs acquired wealth and renown in the Mahratta wars; they seized upon lands which they were afterwards tacitly permitted to retain, and transmitted, with their estates, the services of their adherents to their descendants. The Pindara were a sort of roving cavalry, coeval with the earliest invasions of Hindustan by the Mahrattas, rendering services similar to that of the Cossacks to Russia. When the Peshwa ceased to interfere personally in northern affairs, and that part of the Mahratta affairs became transferred to Sindhia and Holkar, the Pindaras ranged into two parties, the Sindhia Shahi and Holkar

PINEAL GLAND.

Shahi. The horde was called a Luhbur, and out of a thousand about 400 might be well mounted. Their favourite weapon was a spear with a light bamboo shaft and from 12 to 18 feet long. They had no baggage and could therefore move with a speed which no regular troops could accomplish. They were guilty of every outrage that barbarity could suggest on the villages through which they passed. The Pindara or Pindareh, attached themselves as a distinct class to native armies, which they followed, without receiving pay, or being actuated by patriotism and so far from wishing to be distinguished for their prowess as fighting men, they never sought even for plunder, their sole occupation, but where it could be obtained without danger. The Chandpur Sakumbari of Tantia, are described by Colonel Tod as desperate robbers. He saw this place fired and levelled in 1807, when the noted Karim, Pindara, was made prisoner by Sindia. It afterwards cost some British blood in 1817. Though now desolate, the walls of this fortress attest its antiquity, and it is a work that could not now be undertaken. The remains of it bring to mind those of Volterra or Cortana, and other ancient cities of Tuscany: enormous squared masses of stone, without any cement.—*H. T. Prinsep; Cole's Myth. Hind., p. 298; Malcolm's Central Asia, Vol. i, p. 33; Lake's Sieges of the Madras Army, p. 22; Tod's Rajasthan, Vol. i, p. 100.*

This is the fruit of a plant indigenous to America, and the East and West Indies, and now reared in hot houses in Europe. In its wild state, it is inferior to the carefully cultivated. Pine apples of Pegu require so little care, that they are brought into market in Rangoon in vast quantities of the finest quality, from the end of April until the middle of August. About Prome and Tounghoo, they are scarce. It is one of the most abundant fruits in the Tenasserim provinces. Nanas is said to be the name it had among the Peruvians where it was originally found, and the Burman name is nanat; which the Sgau have abbreviated to nay. Its long and rigid leaves, thorny at the edges and point, abound in fine white fibres, which are, in some countries, woven into the finest fabrics, netted or twisted into lines for fishing and into ropes possessed of considerable strength. These are said not to be injured by constant immersion in water—a property which the natives increase by tanning them. The plant is said to have been introduced into India by the Portuguese, in the year 1594. It has, in some parts, become so naturalised, as to appear indigenous. Capt. Turner, in his journey to Teghooloomboo, mentions it as very abundant at the foot of the Himalayas. It flourishes in Assam, and forms thickets near Rangoon. Dr. Wallich, in the year 1836, presented to the Agricultural Society, a bag made on the Khassya hills, of pine-apple fibre, having purchased it for a trifle at Cherapoonjee. He mentions the enormous quantity of pines grown on that range, and Dr. Oxley writes that thousands of acres of pine-apple plant, cover the Malay islands, so that the supply might be considered inexhaustible, of a fibre remarkable as well for fineness as for strength. Dr. Helfer describes the pine-apple as so abundant in the Tenasserim provinces as to be sold in Amherst town in the months of June and July at the rate of one rupee for a boat-load. It chiefly abounds in low grounds, though it is also to be found in the hills amongst the Karens; being a native of the moist forests of South America, from the level of the sea to elevations of about 1,800 feet, requires, for its successful culture as a fruit, a warm and moist climate; but, like others of the family, the species are capable of existing in a warm, dry air. The pine-apple is described as growing in great abundance in the Philippine Islands, but as producing

only a small, rather dry fruit. But we require some precise information to enable us to judge whether this is actually the plant escaped from cultivation. M. Perrotet considers it a distinct species, and has named it *Bromelia pigna*, from the Spanish name *Pigna* or *Pina*, signifying a cone. There, this wild plant is valued on account of the fine hair-like fibres which are separated from out of the leaves. Of these fibres, the celebrated pine-apple cloth of the Philippines, sometimes called "batiste d'ananas," and resembling the finest muslin-like fabric, is woven. This is embroidered by the nuns of the convents in Manilla, with great skill and taste. Some beautiful specimens of these, under the name of *Pina muslin*, were to be seen in the Exhibition of 1851. This is sometimes called grass-cloth, but erroneously. With a magnifier the fibres may be seen to be very numerous and fine, but not twisted at all, as in grass-cloth or the finest muslins and cambrics. Mr. Bennett, in his 'Wanderings,' observes that one of the coarser fibres may be subdivided into threads of such fineness as to be barely perceptible, yet sufficiently strong for any purpose. Mr. Bennett mentions visiting a plantation near Singapore, made by a Chinaman, for the preparation of the fibres of the ananas or wild pine-apple, which are exported to China, being used there "in the manufacture of linens." The Chinese said he got 1½ rupees the catty, for the fibre. The leaves recently gathered—and the largest are preferred—are laid upon a board and the epidermis is removed with a broad knife. Upon its removal from the upper surface of the leaf, the long and beautiful fibres were seen lying upon the lower and denser epidermis, running in a longitudinal direction; the fasciculi of fibres were then readily detached by the hand, on being raised with the broad knife. The separation of the fibre of the ananas is practised in other places besides the Philippine Islands. The Singapore Committee forwarded specimens (*Talinanas*) from Malacca, as well as some of three different qualities prepared at Singapore, and a portion as ready for weaving, that is, with the ends gummed, or joined together by some adhesive substance; thus forming the "invisible knots" of an old author. Specimens were also sent from Java and the island of Celebes. Dr. Roxburgh does not appear to have paid much attention to the separation of the ananas fibre; but in the year 1839, Miss Davy sent specimens of a thread prepared from the wild pine-apple plant of Assam, of various degrees of fineness, observing that the thread must be prepared when the leaves are green, as nothing can be done with them in a dry state. Miss Davy subsequently sent specimens of cloth manufactured from this thread to the

Agricultural Society of Calcutta, observing that she had had much difficulty in getting it woven, as the principal manufacturers in Dacca positively refused to undertake making it into cloth. A weaver in the jungles near Dacca, afterwards undertook to do so, and wove the cloth which was sent. Of this, Miss Davy had some embroidered in silver,—a style of work in which the natives of that part of the country excel. The specimens of the fibre were shown by Mr. E. Solly to spinners in England, but they did not consider it would be substituted for flax in the manufacture of textile fabrics. A patent was, however, taken out by Mr. Zinke, for the manufacture of thread from this fibre, because, when bleached, it could be spun in the same way as flax. The process of bleaching, by destroying the adhesion between the bundles of fibres, renders it much finer; and hence enables it to be extended between the rolls in the process of spinning. He considers that from its beautiful silky lustre, combined with considerable strength, it is well adapted to form a substitute for linen. Pine-apple fibres (*ananas*), and the tow or oakum from them, were also sent to the London Exhibition of 1851, from Madras and Travancore, showing that the art of separating these fibres is extensively diffused. Dr. Hunter received some very fine, strong, and silky fibres from Porto Novo, prepared by Mr. Lima. Besides the fibre, some twine and cord made with it was also sent from Madras and from the Eastward. Mr. Bennett says, that at Singapore, from the cost of labour, the pine-apple fibre could not be prepared under thirty-eight or forty dollars the pecul; but in Penang, or other places where labour is cheap, and women and children could be employed upon it, the expense would hardly exceed ten dollars per pecul. In the experiments which Dr. Royle made with these various fibres, a certain quantity of those prepared at Madras bore 260 lbs., while a similar quantity from Singapore bore 350 lbs. before they broke; but of New Zealand flax the same proportions bore only 260 lbs. In a report from the Arsenal of Fort William, dated June 3rd, 1853, the results are given of some experiments made by Conductor Wilkins on several kinds of rope manufactured by Messrs. W. H. Horton and Co., of Calcutta; and among these there is one of pine-apple fibre, of three inches and a quarter in circumference. The government proof is that a rope of this size should bear a weight of 42 cwt., but it bore no less than 15 cwt. more, that is, it broke with a weight of 57 cwt., proving incontestably that pine-apple possesses strength for cordage, as well as fineness for textile fabrics. In the process of extracting and bleaching the fibres the first step, is to remove the fleshy or succulent side of the

leaf. A Chinese, astride on a narrow stool, extends on it, in front of him, a pine-apple leaf, one end of which is kept firm by being placed beneath a small bundle of cloth on which he sits. He then with a kind of two-handled plane made of bamboo removes the succulent matter. Another man receives the leaves as they are planed, and with his thumb-nail loosens and gathers the fibres about the middle of the leaf, which enables him by one effort to detach the whole of them from the outer skin. The fibres are next steeped in water for some time, after which they are washed in order to free them from the matter that still adheres and binds them together. They are now laid out to dry and bleach on rude frames of split bamboo. The process of steeping, washing and exposing to the sun is repeated for some days until the fibres are considered to be properly bleached. Without further preparation they are sent into town for exportation to China. Nearly all the islands near Singapore are more or less planted with pine-apples, which, at a rough estimate, cover an extent of two thousand acres. The enormous quantity of leaves that are annually suffered to putrify on the ground would supply fibre for a large manufactory of valuable pina cloth. The fibres should be cleaned on the spot. Fortunately the pine-apple planters are not Malays but industrious and thrifty Bugis, most of whom have families. These men could be readily induced to prepare the fibres. Let any merchant offer an adequate price and a steady annual supply will soon be obtained.—*Journal of the Indian Archipelago*, Vol. ii, No. viii, August 1848, p. 523; *McClelland*; *Mason*; *Royle's Fib. Pl.*, p. 377; *Journ. of Agric. Soc. of India*, Vol. viii, p. 182.

PINELLIA TUBERIFERA.

Pwan-hia,	CHIN.	Fan-pwan-hia,	CHIN.
Sang-pwan-hia,		Midsummer root,	ENG.

In China, the tubers of two or three Aroid plants are gathered in the middle of summer and used medicinally. Of these *Pinellia tuberifera*, *Arisœma ternatum*; *Arum macrorum* and others, are soaked and dried frequently until the poison is exhausted, and then cut into slices or made into a powder. In Hankow, they are met with in the form of white or yellowish white spherical balls, the interior is beautifully white dense and amylaceous when fresh, they are emetic and diaphoretic. When dried or in powder, they are given in fever, rheumatism, apoplexy and renal diseases.—*Smith's Mat. Med.*, p. 149.

PINE NUTS, *Neoza chilghoza*, from N. W. India, Cabul, &c. See *Pinus gerardiana*.

PINE TREES, of the genus *Pinus*, belong to the natural order Pinaceæ of Lindley, the Coniferae of Jussieu, the fir tribe of plants. Many species

occur in Japan, in China and in the Himalaya. Of useful plants, the edible pine, *Pinus gerardiana*, occurs abundantly. The pine forests of the hills yield tar, resin, and might yield turpentine, except that, by the native process of preparation, this most valuable product of the crude resin is allowed to evaporate. The pines of New Zealand are the *Dammara australis*, *Dacrydium cupressinum*, *Podocarpus totara*, *P. dacrydioides*, *P. spicata* and *P. ferruginea* and *Phyllocladus trichomanoides*. The Sam or Sha-muh pine tree, of the Chinese is the *Cunninghamia sinensis*, a tree of Japan and of the South, Central and W. provinces of China, at a distance from the sea coast. All parts of the tree are used medicinally, as stimulant, tonic, and sedative remedies: it yields a good timber, used for coffins, flooring, furniture, house frames and for piles, but these latter must not be alternately exposed to the air and water.—*Smith*, p. 172. See Coniferae; Pinaceæ, *Pinus*.

PINE MARTEN, *Martes abietum* does not apparently affect the Western Himalaya, but its skins are brought to India from Afghanistan.

PINE RESIN, see Colophane.

PINE TOP OIL, Oil of *Pinus abies*.

PINE TREE ISLAND, in lat. 10° 20' N. and long. 98° 20' E.

PINEY TREE.

Vateria indica, *L.* | *Elæocarpus copalliferus*, *Retz.*

The Piney tree is a lofty tree of Malabar, which produces the piney varnish, the piney resin or white dammar, Indian copal or gum anime, and the piney tallow or Doopada oil. The resin is nearly equal to copal, and the timber is an excellent building wood, which grows plentifully in the jungles of the Western coast. The tree grows from cuttings and is found planted by the roadside in Malabar. The resin resembles copal, and the finer specimens are as transparent as amber and nearly colourless. It is procured by the very simple process of cutting a notch in the tree, sloping inwards and downwards. This is soon filled with the juice, which in a short time hardens by exposure to the air. When used as a varnish the usual practice is to apply the balsam before it has become hard, applied while in its fluid state, it makes a good varnish. The Peiny varnish tree, or Peiny maram, is mentioned by Dr. Buchanan in his Journey through Mysore, Canara and Malabar. In Vol. 2, p. 476, he says some men of the Panchala tribe, which here is called Penin-glan, paint and varnish by the following process. They take buttermilk and boil it with a small quantity of quick lime until strings form in the decoction, and separate from the watery parts, which they decant. The stringy matter is then mixed with the paint, which has

been well powdered: with these the wooden work is first painted, it is then allowed to dry for one day, and afterwards receives a coat of Pundum, which is the fresh juice of a tree called Peiny marum. The Pundam must be used while it is fresh and will not keep for more than two or three days after the first coat of paint is given, and that is followed by another of varnish. In the same manner leather may be painted and varnished. The varnish effectually resists the action of water, but when that is not procurable the resin melted by a slow heat and mixed with boiling linseed oil forms a varnish which answers equally well for most purposes. As this varnish is one of the finest description, the following formula for its preparation may prove useful to some who are unacquainted with the process. Into a new and perfectly clean earthen vessel (a chatty) put one part of the Piney dammer, in coarse powder, cover closely, and apply a very gentle heat until the whole is melted; then add about two parts of linseed oil, nearly boiling hot, and mix well with a wooden spatula. Should the varnish prove too thick it can at any time be reduced by the addition of more oil, or, if required, may be made thicker in the first instance. It is essential to the success of the process that the piney be melted in a covered vessel over a very slow fire, and the whole of it reduced to a fluid before the addition of the oil, which must, to ensure an equal mixture, be nearly boiling hot. This varnish is used for carriages and other fine furniture requiring to have their paint well protected, or to which it is desirable to impart a fine gloss. A spirit varnish is prepared by reducing to powder about six parts of Piney and one of camphor, and then adding hot alcohol sufficient to dissolve the mixed powder. Alcohol does not dissolve Piney without the aid of the camphor, but once dissolved will retain it in solution. The varnish thus prepared is employed for varnishing pictures, &c., but before being used requires to be gently heated to evaporate the camphor, which otherwise will produce by its after-evaporation a roughness and inequality on the surface of the picture and spoil its appearance.

Piney tallow or Dupada oil.

This oil remains perfectly solid even in hot climates. It is prepared by cleaning the seeds, then roasting and grinding them into a mass. To 5 seers of seed, add 12 seers of water, and boil until the oil rises to the surface. Remove the oil, stir the contents of the vessel, and allow it to stand until the following day, when more oil will be observed on the surface, which may be collected and the process repeated. The oil is principally used for lamps, but is very

suitable for soaps and candle-making.—*M. E. J. R. ; O'Shaughnessy, p. 755.*

PINEY TREE, or Poon tree of Pinang, is the *Calophyllum angustifolium*, Roxb. It occurs in Pinang, also in Coorg, Mysore, Canara, and along the Ghats, northwards to Sawuntwarree, but rarely of any great size beyond the line of the Neelgoond ghat. It is a magnificent tree when growing in the ravines of the southern ghats of Canara. According to Drs. Gibson and Cleghorn, Poon spars are obtained from this tree, but on the western side of India the trees are becoming scarce, and are perhaps more valuable than teak, Dr. Gibson says that, to the best of his knowledge, the Poon spars are furnished by *Calophyllum angustifolium*, which is a magnificent tree in the ravines of the southern ghats. In habit and appearance, it is totally distinct from *C. inophyllum*. These spars are found along the ghats, from the Sawuntwarree border southward, but rarely of any great size till the line of the Neelgoond ghat is passed. At another place he says that the Poon spars of the first class were not procurable in the jungles nearest to the coast, and probably, owing to the continued extension of cultivation. It is rather from the inland forests of Canara, backed as these are by those of Coorg to the east, that the supply of Poon spars is principally drawn. On his way from the Mysore border to Sircee, he saw, in more than one place, immense spars of Poon standing as trees, but scorched, burned up, and rendered useless. Dr. Cleghorn tells us that young trees, especially such as are in accessible places, are most carefully preserved in Coorg, Mysore and Canara. In one case which came within his observation, several valuable spars were found in a bridge, the total estimate of which was 250 rupees. But Poon spars, although highly prized for ship-building, are ill suited for making bridges. This incident he remarks, illustrates the importance of officers in the Department of Public Works, Telegraph, &c., making themselves acquainted with the description of timber available and suitable for their wants. He also mentions that the Superintendent of Coorg had received several tenders for the supply of Poon spars and other timber at the distance of at least three miles from the Soolia river, showing the scarcity of such wood and the readiness of the Mangalore contractors to carry it several miles to the nearest water carriage. These opinions of Drs. Gibson and Cleghorn, that the Poon spars of commerce are obtained from the *Calophyllum angustifolium* are of great value. But in 1850, in the Proceedings of the Madras Central Committee for the Exhibition of 1851, the Poon of commerce was supposed by Dr. Wight to be from the *Dillenia pentagynia*, "Rowaden," TEL., a large timber tree. The wood of *Dillenia pentagynia* is

Solid oil of Vateria indica,	Piney yenne,	TAM.
ENG.	Dupada nuna,	TEL.

said to be exceedingly strong and very durable, even when buried under ground, and is a stately forest tree, common on the face of the W. Ghats. It is also a native of the Northern Circars and flowers in March and April. The similarity of native names between this and *Calophyllum inophyllum*, led Dr. Wight to suspect some confusion. Dr. Wight was satisfied that *D. pentagynia* is the tree which furnishes Poon spars, being a tall, and *Calophyllum inophyllum* a short stunted tree. Dr. Cleghorn commends the strict conserving of *C. angustifolium*, in Coorg and Canara.—*Drs. Gibson, Cleghorn, Wight and Roxburgh; Mr. Rohde's MSS.; Markham, p. 452.* See Poon.

PINGI-NACHHI, BENG. *Panicum helvolum*.

PINGO, SINGH., the cowri or cavadi of the peninsula, is an elastic stick loaded at both ends, poised on the shoulder, used in Ceylon for carrying burthens.—*Simmond's Dictionary.*

PINGUICULACEÆ, *Lincll.* 22 species.

PINGULU or pingala, SANS. Variegated.

PINGULU-NAGA, SANS., from pingala, brownish-yellow, and naga, a serpent.

Found on the coasts of Japan, in the Baltic, Cape Kobin, Sicily and Maryland.

PINJAL. About the beginning of May the monsoon clouds collect on the tops of the Pinjal, and continue depositing their contents for the three succeeding months. The S. W. monsoon becomes expended by the time it has emptied its contents on the northern Pinjal, which also accounts for the verdure of these ranges compared with the more northern chains of Ladakh and Tibet. On the northern Pinjal they drop more of their moisture in the shape of snow and rain, and then pass over into the thirsty lands beyond, with scarcely enough vapour in them to make even a cloud.—*Adams; Maury's Physical Geography of Sea.* See Pir Pinjal.

PINJARA, HIND, a cotton cleaner. He uses in his trade the following apparatus.

Tatti,	2 annas.	Goolal,	$\frac{1}{4}$ anna.
Dastah,	8 "	Tarazoo,	1 "
Kunar,	40 "	Total...	Rs. 3 3 3

A Pinjara can clean 72 lbs. of cotton in a day and earn about eight annas daily.

The cotton wool after being separated from the seed, is beaten to open out the fibre and fit it for spinning.

The *Rahat* of Dharwar is the cotton spinning-wheel.

The *Tanwul*, is the rack, on which the thread is wound to form into hanks for sale.

The *Foot-roller* of Dharwar, for cleaning cotton, is worked with two feet on a stone by a woman sitting, or rather balancing herself on a low stool. The seeds are rolled out in front, and the cotton drawn away as fast as it is freed from the seed, and piled up behind under the stool.

The *Ratee*, or roller of Dharwar, is sometimes used for separating the seed from the cotton.

PINJI, HIND. *Pennisetum italicum*.

PINJRAPOL, HIND. In India, a hospital for sick animals. The account given by Pietro de la Valle, who visited India in 1623, shows how very ancient this custom is. The same day of our "arrival," says he, 'after we had dined, and rested a while, we caused ourselves to be conducted to see a famous hospital of birds, of all sorts. The next morning,' adds he, "we saw another hospital of goats, kids, sheep, and wethers, either sick or lame." The Jains are the great protectors of animal life. They, together with the buddhists, are pre-eminently tender on this point, not only on the score of humanity, but from their belief in the doctrine of metempsychosis which teaches them to regard the brutes as of their own kin, the tenements not improbably of the souls of their ancestors. The celebrated king Asoka, who flourished about 250 years before Christ, was the first hindoo sovereign known to have favoured the tenets of the Jains. His capital was Palibothra, at the junction of the Soane and Ganges. The inscription on the palaces of Delhi and Allahabad, on the rocks in Affghanistan and Girnar in Cutch, refer to the events of his reign. On one of these tablets, Asoka proclaims, that though, until then, hundreds of thousands of animals had been killed daily for the Royal kitchen, from thenceforth the practice should be discontinued, as he had become religious. On another it is proclaimed that throughout his dominions, trees for the shade and shelter of men and animals, and wholesome and nutritious vegetables for their consumption shall be cultivated. It is considered probable that the Jains and buddhists set their faces against animals suffering, as a contrast to the cruelties at the time practised by the brahmins, and that they to some extent succeeded in shaming them down. It appears from the Ramayana that the brahmins of those days made offerings not only of flowers and plants but of slaughtered horses, hogs and sheep; the sacred cow herself being occasionally offered on

the altar. At their feasts both butcher meat and intoxicating liquors were freely indulged in. The brahmin hermit Bharadwaja gave a magnificent entertainment at Allahabad to Charat and his army, where venison, the flesh of the wild boar, mutton, peacocks and partridges with abundance of strong drink, furnished forth the repast. Menu considers the feast in honour of a dead relation incomplete unless where animal food is present: we have no authoritative information as to when the present protective system crept in: that it is not countenanced by the sacred books of the hindoos or the customs of antiquity and is a matter comparatively of yesterday is apparent. We are still more in the dark as to the introduction of hospitals for aged and diseased animals. The first we find described is that at Surat of which Ovington gives an account as he saw it in 1689, Hamilton describes it as he saw it in 1772, Heber speaks of that at Broach in 1824. There is nothing that can be adduced in their support either from the sacred works of the hindoos, the Asoka inscriptions or the institutes of Menu, more than may be inferred from the proverbs of Solomon that "the merciful man is merciful to his own beast." The homage to brute animals originally confined to the Jains and buddhists, and not even making its appearance amongst them until a comparatively recent period of their history slowly extended itself amongst the brahmins, and in the early part of the 19th century had infected the Parsees. This comparatively enterprising and enlightened race, so far from being exempt from the degrading superstitions of the hindoos as has been asserted, seem to have picked up some rags from the superstition of every sect and denomination with which they have come in contact, and patched it on to their own comparatively simple creed. The superstition of the banians, like themselves a great trading community, seems to have been peculiarly attractive to them, and the Pinjrapol being their pet institution, speedily secured the sympathies of the Zoroastrians. It is said that in the reign of the emperor Akbar, a pious married pair from the Malabar Coast resolved on making a pilgrimage to Benares. When their journey was near an end, the wife was taken in travail, and a man-child was born to her; unable to carry him on, they left him one evening behind them on the moor. Next day the grass was found blazing everywhere around, but the infant was lively and unburnt, the blaze refused to approach him. He was taken charge of by the priests and pronounced at once a child from heaven, the offspring of the deity. The boy waxed and grew, and shewed an early aptitude for knowledge and when he reached the age of manhood visited the various shrines, castles, and courts around, preaching a form of

faith altogether new, specially inculcating tenderness to, and care of animal life. He was the first Maharaja of the Banians. There are about two hundred now alive who claim direct descent from him and are believed by their worshippers, incarnations of the deity. They exercise the most absolute authority both spiritual and temporal over their votaries, who bow with the most abject submission to their behests. If there be any truth in a pamphlet lately published regarding them, their lives and conversation are scarcely such as becomes the heaven descended.

The Bombay Pinjrapol owes its origin as much to the Parsee worship of sacred dogs as to the superstitions of the Jains. In 1813, the dogs running wild and masterless in the street had become so intolerable a nuisance that an order was issued for killing them, and the result of this was a succession of street rows and disturbances betwixt the dog-destroyers and dog-worshippers, which led the latter to offer a sum of money for each mangy cur that was released from durance and made over to them. Some 30,000 or 40,000, of these canine incarnations of the deity, were in this way annually packed off, the bulk of them were sent to an island near the mouth of the Taptee to starve, or to worry or infect each other. So cruel are the tender mercies of the wicked and superstitious. Great expense was incurred on this account, and as the funds began to diminish from failing zeal, Motichund Amerchund, the great Jain merchant, and partner of Sir Jamsetjee Jejeeboy exerted himself and obtained an agreement on the 18th October 1834 from Shree Gosainjee Maharaja, and setts of the hindoos, Parsees, and others, by which they bound themselves to raise taxes on opium, cotton, sugar, bills of exchange, and pearls "that the lives of a great many animals may be saved, which is an act of great charity," the shrawuks, or Jains agreed to raise a fund amongst themselves for the required ground and building, the rates were collected and sent yearly to the managers appointed, namely, Bomaujee Hormusjee Wadiajee, Sir Jamsetjee Jejeebhoy, Motichund Amerchund, Vukutchund Khooshalchund. The agreement signed by about 450 merchants, contains a clause stating that any excess of the funds may be applied to such charitable objects as may be approved of by the trustees. At one time there were about seven lacs of rupees (£ 70,000). Whilst the Bombay pinjrapol was under the vigilant superintendence of our Parsee Baronet, the funds poured amply in and the institution was most carefully conducted. Since 1851, the place has become a sink of animal and moral corruption. When seen by the Editor in 1866, it was filled with wretched filthy sick animals. Prices on com-

modities, like other prices, fall all ultimately on the consumers. The Lancashire Cotton-spinners are not perhaps aware that from their pockets are drawn the means of supporting one of the most filthy and disgusting establishments for the torture of brute beasts mind of man or fiend can conceive. It is chiefly from the date of its wealth that the Bombay institution became a nuisance, and though people were disposed to overlook all and everything in the great Parsee Baronet, in consideration of the darkness and ignorance of the age in which he was brought up, it will never do for his kinsmen, still less for his descendants, to be presented to royalty, or to the baronetage of England, as worshippers of unclean brute beasts, the keepers of knackers' yards or mangy dog kennels. The existence of the pinjrapol is of itself enough to show the immeasurable distance that intervenes between those who delight in the self-assumed designation of the "Saxons of the East" and their rulers, the Saxons of the West.

It fearfully fails to fulfil any one of the ends it professes to aspire after. To the horse, the ox, the goat, the sheep and the dog, more especially the first and the last, fresh air and exercise are indispensable, not only to health and enjoyment, but to existence. As to the horse "he is a hunter of the hills, to him confinement is a curse, and followed by the worst of ills." The noble beast who probably has never once within his life been tied up for forty-eight hours on end, whose master daily even and morn, when there was no work for him to do, saw that he had air and exercise—is, from the day that he enters the pinjrapole, to that when his dead carcass is dragged out of it, pinned down to one spot as firmly and irrecoverably as is the insect in the cabinet of the entomologist. Better die a hundred deaths at once than thus be tortured and slain by inches. The cattle, sheep and goats fare but little better; the dogs are infinitely worse off than the horses: it not unfrequently happens: that animals which have been sent there by mistake are recovered by their owners, a single hour in the kennels sends them back covered with vermin, and infected with the most loathsome diseases. Lions, tigers, panthers, and other carnivora are occasionally kept in the pinjrapol; it is forgotten that for every day that one of these is kept alive, one sheep or goat must die to feed it. A butcher sometimes receives a large sum for abstaining from the slaughter of sheep or kine. The man pockets the money and keeps his bargain. As the market must be supplied the number spared at one shop or house is made up next door. The precept outwardly attended to in the letter is violated at every turn we take in spirit.

We trust these things will be taken into con-

sideration by the natives who worship the pigeon, the cow and the dog, and that they will cease endangering the lives of their fellow-creatures. —*Bombay Standard*, 1858; *Bombay Times*.

PINTO, FERDINAND, the first European who visited Japan. He landed at Cape Bungo towards the end of 1542, in lat. 33° 32' N. and 132° 2' E. long. He was either shipwrecked there or landed intentionally.

PINUS, a genus of trees belonging to the Pinacæ or Coniferæ. Cone-bearing pines with long leaves, like the common Scotch fir, are found in Asia, and as far south as the equator (in Borneo) also inhabit Arracan, the Malay peninsula, Sumatra and South China. It is a very remarkable fact that no *Gymnosperm* tree inhabits the Peninsula of India; not even the genus *Podocarpus*, which includes most of the tropical *Gymnosperms*, and is technically coniferous and has glandular woody fibre though like the yew it bears berries. Two species of this genus are found in the Khasia, and one advances as far west as Nepaul. The absence of oaks and of the above genera (*Podocarpus* and *Pinus*) is one of the most characteristic differences between the botany of the east and west shores of the Bay of Bengal. At Churra there is but one pine (*Pinus*

hasiana) besides the yew, (and two *Podocarpi*) and that is only found in the drier regions. Singular to say, it is a species not seen in the Himalaya or elsewhere, but very nearly allied to *Pinus longifolia*, though more closely resembling the Scotch fir than that tree does. The Pine tree genus consists, for the most part, of timber trees, many of which are of great beauty and of much value on account of their timber. Many of them are growing along with fir trees (*Abies*), yew trees, and the larch (*Larix*) in the northern Himalaya, in China and Japan, and one or two in Burmah, one? in Cochinchina and one in Arabia. These have been noticed by Drs. Wallich, Royle, O'Shaughnessy, Hooker, Mason and Brandis, and Thunberg described others in Japan. - *Hooker's Hum. Jour.*, Vol. ii, p. 282. PINUS BRUNONIANA, Wall.

Pinus dumosa, Lamb.

Abies brunoniana, Siebold, Hooker.

Silver fir,

ENG. | Semadoong.

A tree of Nepaul, Bhootan and Gossain Than, growing occasionally in dense and gigantic forests, 70 to 80 feet high, with a clear trunk of from 15 to 20 feet, and a spreading branching head. Dr. Hooker measured one 28 feet in girth. - *Eng. Cyc.*; - *Hooker's Him. Journal*.

PINUS CEDRUS, Linn., Lamb. Syn. of *Abies cedrus*. See Cedar.

PINUS DAMMARA, Linn., Burm., Wall.

Agathis loranthifolia, Salisb.

This grows on the lofty mountains of Amboyna, and according to Dr. Wallich, in Tavoy, a very large tree, used in building.

White Dammar, a product of this tree, occurs in fragments of variable size, marked with reddish streaks, transparent, amber-like, brittle, with brilliant fracture, very inflammable, inodorous, and tasteless. It hangs from the branches, and resembles stalactites, the prices being sometimes as large as the hand, and 4 to 8 inches long; some pieces are like animal resin. - *Dr. Wallich*.

PINUS DEODARA, Lambert.

Cedrus deodara, Lambert. | *Abies deodara*.

Sacred Indian fir,

ENG. | Kelon?

HIND.

Deva-dara,

HIND.

The most celebrated of the Himalayan pines, noticed by Avicenna, found in Nepaul, Kemaon, Kashmir, at 7,000 to 12,000 feet. Leaves and twigs used in native medicine. Produces a turpentine called Kelon ka tel, used as a stimulant to foul ulcers. It is a tree of great size, a native of the mountains north of Rohilkund. It differs from *P. larix* in many respects, but most conspicuously in being destitute of the bracts which project beyond the scales of the strobile or cone. The

PINUS GERARDIANA.

tree is so exceedingly replete with resin, as to yield a very large proportion of tar. A manufactory of that article was formerly begun, by Mr. Gott, near the skirts of the Almora mountains.—*O'Shaughnessy*, p. 612; *Roxburgh's Fl. Ind.*, Vol. iii, p. 653; *Cleghorn's Punjab Report*, p. 1.

Tongchi,	CHIN.	

A tree of Narambetty, Nepal, Simla, Bootan, Sirmoor and Gurhwal, a plant of Kaghan; scarce at Murree. It grows in West Nepal, not in East Nepal and Sikkim, but is common in Bhootan. It is found with the Deodar, at Narambetty, Theog. Resembles the Weymouth pine, and is remarkable for its drooping branches. Dr. J. L. Stewart says it has recently been identified with *P. peuce* which grows only in a confined locality in Macedonia at from 2,400 to 5,800 feet. It is common in many parts of the Punjab Himalaya, generally growing in mixed forests, from 5,000 to perhaps 11,000 feet, the 13,000 feet given as a maximum by Aitchison, is probably a mistake. It also grows sparingly in western Tibet at 8,000 to 10,000 feet: Trans-Indus. Griffith found it in Kafiristan, and Bellew near the Sufed Koh at 9,000 to 10,000 feet. Trees of 8 and 9 feet girth are not unfrequent, but it rarely reaches 100 feet in height, although trees of 150 feet occur at times. It furnishes the best wood for most purposes of all the Himalaya conifers next to deodar, and where the latter is scarce or dear, this is used for all the ordinary purposes of construction. In Kullu as shingles, it is said to last 7 or 8, and inside 15 years. And at Murree, where it is the best wood procurable for shingles and ordinary purposes, the supply in A. D. 1860, was rapidly getting exhausted. The wood is so resinous as to be used for flambeaux and candles.—*O'Shaughnessy*, p. 612; *Dr. J. L. Stewart's Punjab Plants*, p. 225; *Hooker's Him. Jour.*, Vol. ii, p. 45; mentioned at p. 189 of *Balfour*, and in para. 146 of *Mr. Barnes' Kangra Settlement Report*; *Lt. Col. Lake, Commissioner of Jhullender Division*.

PINUS GERARDIANA.

A tree with a lofty trunk, a native of the coldest forests of the Himalaya, confined to the northern and drier face beyond the range of periodical rains far among the hills, and its presence is indicative of a dry climate. It grows in one or two small clusters on a ridge with a northern exposure, near Walassa, but does not generally ripen its fruits; is found in the Sutlej valley between Rampur and Sungnam at an elevation of 5,000 to 10,500 feet. The neoza or chilgoza pine, is first seen on the Miru ridge, and above Chini becomes a principal tree of the forest, produces a very large cone, containing, like the stone-pine of Europe, eatable nuts, of an elongated oblong form, which, when roasted like chesnuts, are agreeable to the taste, though with a little flavour of turpentine. The seeds are collected and stored for winter use, being a regular article of food, the price asked in spring was two annas per seer. Its nuts are eaten in Tibet and Afghanistan. This tree has been repeatedly tried in the rainy districts of the Himalaya, but will not succeed, a dry climate being essential to it. It is said to be found below the Niti Pass, high in Kumaon, but the dried specimens at Saharanpur hardly agree. It is common in a part of the Upper Sutlej basin, at one spot on the Ravi, and on a short portion of the Upper Chenab and its tributary, the Marru. It is also reported by Falconer and Winterbottom, as growing near Astor and Gilgit, not far from the Indus; is found near the Sufed Koh (Bellew) and in Kafiristan, &c., north of Kabul (Griffith). Its range in the Punjab-Himalaya may be put at from 5,800 to 8,800 feet. Dr. Stewart believes there is some mistake in Cleghorn's 10,500 feet on the Sutlej. It does not, as a rule, exceed 6 or 7 feet in girth, although he had seen it up to 12 feet, and its height does not generally range over 50 or 60 feet. It is a short trunked tree and the boughs and often the stem are much curved. The timber is but little used for construction, but must be considered tough, for Dr. Stewart had seen it used for the sticks on which the passenger by the swing-bridge sits, and on which his life depends. It is very resinous and is generally reckoned the best of all for torches and fuel, but on account of the value of its fruit is not often taken for these purposes. Major Longden says that the Kanawaris do not use its resin as it "gets too hard," but he extracted excellent tar from the wood by destructive distillation. On the Sutlej, a rude basket is formed from a piece of the bark having its corners fastened together by wooden pins. The chief product of the tree consists of the seeds, of which there are more than a hundred in a full-sized cone. In the Himalaya they ripen about October and are extracted from the nu-

585

ing purposes, but if exposed to the action of the weather and water is quickly destroyed. Lathing made of it is named "dadur." This pine exudes naturally or yields to incisions a very fine turpentine, which is called gunda baroza in the bazaars, birje andcheer ke gond, Pms., Birozhehtur. But Ganda-barozah is a name also given to Indian olibanum. Wood is light-yellow, easily worked, and light; used for timber for building purposes and for boats. The resin is used for coating timber to prevent decay from the action of water, and also as a medicine; it also forms a material in the manufacture of glass bangles or rings worn by native women. The heart-wood, which is very oily, is used for making torches. The natives of the outer Himalaya prepare tar in a simple way from fragments of the wood. The dry chips are put into a large earthen pot, with a narrow neck, containing about 10 seers, and in the bottom four or five small holes (1-5th inch) are drilled. The pot so filled, is luted over with stiff wet mud on the top and sides. A hole being dug in the ground, a smaller pot, holding $\frac{3}{4}$ seer, is placed in it, and the larger one on the top: the joint being luted, and the surrounding space filled up with earth, a heap of cow-dung bratties (15 seers) is piled over the whole, and as much more as is required to keep up the fire for 8 or 9 hours. The residue of each pot gives 5 chitaks of tar and one seer of charcoal; four men will easily make 2½ maunds, or nine large pots full of tar in the month, and the cost will be Rupees 21, viz., four men at 5 Rupees=20 Rupees; purchase of pots, 1 Rupee; on 2½ maunds = 3 annas 8 pic per seer. The value of the charcoal, near the railway or a large town will reduce the cost of tar to 3 annas per seer, or probably less. The product appears to be equal to the tar imported from Europe which is prepared on a larger scale. Mr. J. D. Smithe, Civil Engineer, adopted a modification of this plan at the Madhopore workshops. On the large pot, holding 12 seers and filled with chips he placed a smaller one inverted, luting the joint and upper surface with stiff mud, 5 inches thick; these vessels thus prepared, are put on the top of a third which we may call the receiver, and as in the former method, the joint being luted, the whole is covered with fuel and a fire lighted. Four to eight hours are necessary to extract all the tar. After the fire has been extinguished and the vessels have cooled, the ashes should be raked out, until the under vessel or receiver is visible; the large pot should then be carefully lifted off with a thick cloth in the hands. As the layer of mud is essential for the preservation of the vessels, time and fuel will be saved, if by careful management, the coating is not

broken; each time it is renewed, a considerable expenditure of fuel takes place. Care is necessary in lifting the large pot to prevent lute or ashes falling into the receiver which contains the tar. The charcoal should then be taken out of the large vessel and the tar out of the receiver, when they are ready to be charged again, as at first. Common bazaar pots may be used, and with good management, they may be fired 10 or 12 times: the economical working of the tar factory very much depends upon care and attention. The pots may be worked in a row 1½ foot apart—by this arrangement there will be a great saving of fuel. The average produce according to Mr. Smithe is as follows:—"One seer of wood yields 2-6th chitaks of tar, and 4-3rd chitaks of charcoal, giving 6-9th chitaks as the produce of each seer of wood put into the pot, or 43.1 per cent. To procure a seer of tar, 6 seers, 4 chitaks of fresh chips are required for charging a pot, and 2 maunds, 6 seers and 9 chitaks of chips for fuel." The estimated cost is about one anna per seer, which, however, seems to be too low. The preparation of tar will be found useful for clearing the timber yard of chips which accumulate rapidly and are usually unsaleable. The pots should be charged with chips about 1 or 2 inches thick and 3 to 5 inches long. The tar produced by the above process, from the chips of Deodar, (*Cedrus deodara*), Chil, (*Pinus longifolia*), or Kail, (*Pinus excelsa*), is of a superior description, equal to Swedish tar. It is a mixture of resin and oil of turpentine, more or less blackened by the admixture of empyreumatic products: it thickens after exposure to the atmosphere, and may be used for coating boats; it is valuable as a preservative for all the wood-work of dams, regulating bridges and railway sleepers, also for telegraph posts and wooden fencing.—*Royle's Ill.*, pp. 349, 351; *Cleghorn's Punjab Report*, p. 63; *Eng. Cyc.*; *Hooker's Himalayan Journ.*, Vol. i, p. 182; Vol. ii, p. 45; *O'Shaughnessy*, p. 612; *Balfour*, p. 189; *Mr. Barnes' Kangra Settlement Report*, para. 143; *Lieutenant Colonel Lake, Commissioner, Jhullender Division; Selections from the Public Correspondence of the Punjab Administration*, Vol. ii, p. 251.

PINUS MASSONIANA, Lamb., Abel?

Tinyooben, BURM.

A moderate sized tree found in the forest of *Dipterocarpus grandiflora* (Eng. forest), east of the Salween river. Spars of this species have occasionally been brought down to Moulmein. In a full grown tree on good soil the average length of the trunk to the first branch is 50 feet and average girth measured at 6 feet from the ground is 6 feet.—*Dr. Brandis, Cal. Cat.*, Ec. 1862.

PINUS ROYLEANA. Deodar of Nepal.

PINUS SINENSIS, the Chinese pine, a large tree, is repeatedly noticed by Mr. Fortune. He says, *Pinus sinensis*, is met with on the sides of every barren hill, both in the south and north of China, and is generally badly used by the natives. It is grouped about in all directions, and attains to a great size. Many of these hills are well-wooded. He remarked as he went along good forests of Chinese pine (*Pinus sinensis*), the Japan cedar (*Cryptomeria japonica*), and the lance-leaved fir (*Cunninghamia lanceolata*). The forests of the Japan cedar and the lance-leaved fir were extremely picturesque and beautiful. The trees generally were young and not remarkable for size but were growing vigorously, and likely, if allowed to stand for a few years, to make valuable timber. In addition to this consideration, there was a symmetry and grace in the general appearance of these forests which one rarely sees in temperate climates, if we except perhaps the Himalaya mountains.—*Eng. Cyc.*; *Fortune's Tea plants*, p. 7; *Fortune's Res.* p. 189. See *Cunninghamia*.

PINUS SMITHIANA, *Wall*.

Abies khutrow—?

| *Abies smithiana*, *Hooker*.

Indian silver fir, *ENG*. | *Sch*,

HIND.

A spruce fir tree of enormous size on the slopes of the Himalaya. It has a dark and sombre appearance, but is peculiarly graceful owing to its symmetrical form and somewhat pendulous habit. Its wood is white but considered indifferent though readily split into planks, and is used for beams and posts.—*Hooker's Him. Jour.*, *Royle's Illust. Him. Bot.*, p. 350.

Khurra, DUK. | Namum, TAM
This is of a greyish white colour, with an earthy fracture, and a smooth greasy feel; it adheres to the tongue, and is very plastic, tenacious and infusible. When burnt it is of a cream colour, and is used for tobacco-pipes and white pottery. It is found in abundance in several parts of India and is used for the same purposes that it is in Europe. Some of the castes of hindoos, too, employ it for making the distinguishing marks on their foreheads, and (moistened with water) it is often applied round the eye, in certain cases of ophthalmia, as well as to parts of the body that are bruised.

PIPER BETLE.

Chavica betel.

Pan,	DUK.	Tarnbooli,	SANS.
Betel: Betel Vine,	ENG.	Vettilay,	TAM.
Pan,	HIND.	Tamalapakoo,	TEL.

The leaves of this vine and of *P. siriboa* are extensively used by the natives of the East and West Indies to chew along with the nut of the *Areca catechu* and quicklime, as a restorative of the powers of the stomach and promoter of digestion. It is capable however of producing, like some other species of *Piper*, intoxicating effects, and should be used in moderation. *Piper betle* is largely cultivated throughout the peninsula of India and in Ceylon. In Pegu it grows wild in the Pegu forests, on the Cadoojway Choung.—*Hogg's Vegetable Kingdom; Eng. Cyc.; McClelland.* See Betle.

Pipula-mool,	"	Pippalli Katte,	TEL.

A native of the south-east of Asia growing wild in India, along water-courses, towards the Circar mountains, but is much cultivated. The female spike having attached to it the dried half-ripe berries (resembling the catkin, of the birch), is used in medicine. It has nearly the same chemical composition and properties as black pepper, though feebler. It is said to contain piperin. The root (*Granthicka, Sans.*) sliced and dried, constitutes the *Pippula moola* of the native druggists, a substance much used as a stimulant remedy and spice by the hindoos, but it is still weaker than the fruit. The analysis of the fruits of the long pepper corresponds closely in results with those of the *Piper nigrum*. Long pepper is a creeper of easy culture and should be trained on poles, or have strong sticks to grow upon. It is common in all parts of India, is extensively cultivated in the Northern Circars; its use is rather limited, but as, in the commercial returns, it is always included with black pepper, the quantity cannot be ascertained. Long pepper is readily propagated by cuttings. The stems are annual, and the roots live for several years, and when cultivated, usually yield three or four crops, after which they seem to become exhausted, and require to be renewed by fresh planting. Its berries are lodged in a pulpy matter like those of *P. nigrum*. They are first green, becoming red when ripe. Being hotter when unripe, they are then gathered and dried in the sun, when they change to a dark grey colour. The spikes are imported entire. The taste of the berries is pungent though rather faint.—*O'Shaughnessy, p. 575; Jaffrey; M. E. J. R.*

PIPER METHYSTICUM, Ava pepper, a native of the Society, Friendly, and Sandwich islands, where it is called "Ava"; used in a tincture in chronic rheumatism, and in infusion as an intoxicating beverage, which is also deemed antisphyilitic. To cure venereal, the patient drinks an infusion until he become drunk, after which copious perspiration ensues.—*O'Shaughnessy, p. 575.* See *Dracæna*.

A climbing plant, native of Malacca, Java and Sumatra, cultivated all along the Malabar Coast, but found wild among the hills of the Rajahmundry district, and very extensively

PIPER NIGRUM.

cultivated from 96° to 115° E. long. 5° S. lat. to 12° N. lat. which limits comprise Sumatra, Borneo, the Malay Peninsula, and all countries to the east of the Gulf of Siam. The best pepper comes from Malabar, the least esteemed from Java and Sumatra. The plant is allowed to grow, trained to the stem of the Areca catechu and other trees, especially the Jack (*Artocarpus*) and *Hyperanthera moringa* (or horse radish tree), four years before the fruit can be collected. The berries are gathered when yet green, before they are perfectly ripe, and quickly dried on mats, by which they turn black. When plucked too young, they speedily fall into a state of powder. These are separated from the others by sieves and winnowing. In this condition it is termed black pepper. White pepper is the same fruit freed from the outer rind: for this purpose, the ripe berries are allowed to macerate in water, and the husk is removed. These are smaller, smooth, of a greyish-white colour, varying to yellow, with a less powerful odour and taste than the black. The root is a tonic and cordial. Both black pepper (*Piper nigrum*) and long pepper (*Piper longum*) grow wild in considerable quantities in the hilly tracts of Goodem, and probably along the whole of the pestiferous range of the Eastern Ghats. The latter finds its way in small quantities down to the bazaars on the coast, but the black pepper is entirely neglected, and does not appear to be gathered even for local use. Black pepper and long pepper appear to have been used as febrifuges in the east from the earliest periods. The powder and the root of long pepper have been much employed in hindoo medicine. The root is said to be bitter and dry, it is a stimulant tonic, is employed for coughs and indigestion also fever. The black pepper vine is indigenous to the forests of Malabar and Travancore, and for centuries has been an article of exportation to European countries from that coast. Malabar pepper is considered to be the best. Its cultivation is very simple, and is effected by cuttings or suckers put down before the commencement of the rains in June. The soil should be rich, but if too much moisture be allowed to accumulate near the roots, the young plants are apt to rot. In three years the vine begins to bear. They are planted chiefly in hilly districts, but thrive well enough in the low country in the moist climate of Malabar. They are usually planted at the base of trees which have rough or prickly bark, such as the Jack, the *Erythrina*, Cashew nut, Mango tree and others of similar description. They will climb about 20 or 30 feet but are purposely kept lower than that. During their growth it is requisite to remove all suckers, and the vine should be pruned, thinned and

PIPLIANAGAR.

kept clear of weeds. After the berries have been gathered they are dried on mats in the sun, turning from red to black. They must be plucked before quite ripe, but if too early they will spoil. The pepper vine is very common in the hilly districts of Travancore, especially in Cottayam, Meenachel and Chenganacherry districts, where at an average calculation about 5,000 candies are produced annually.—*Ainslie*, p. 265; *O'Shaughnessy*, p. 571; *Eng. Oyc.*; *Riddell*; *M. C. C.*; *Ind. Ann. Med. Science for April*, p. 394; *Powell's Hand-book*, Vol. i, p. 376.

PIPER PSITTACORUM, the Norfolk Island spice, attains the height of ten feet, and has cane-like joints, and heart-shaped leaves. It produces a yellow, pulpy, pendant, cylindrical fruit of a spicy, sweetish taste, which is an excellent preserve, and, if gathered green, it is equally good pickled. The leaf bears great resemblance to that of the Pan, or Piper betel creeper of the East Indies.—*Keppel's Ind. Arch.*, Vol. ii, pp. 284-5.

PIPI. The Himalayan pipit (*Heterura sylvana*) frequents verdant spots, usually at high elevations, and in appearance, as in habits, is a true pipit. It is one of the first ornithological objects to be met with on ascending the grassy sides of the mountains.—*Adams*.

PIPLIANAGAR a town in Bhopal from which was obtained a copper plate inscription in Sanscrit. Date A.D. 1210. Character Deva Nagari. Instead of the usual hindoo invocation, it is to virtue. The snake Shesha, Parasurama, Rama, Sita, Yudhishtira, Bhima, Kansa, Indra, Saraswati, Sambhu, raja Bhoja Deva, son, Udayaditya, Naravarma, Yashovarma, 1137 A.D. Ajayavarma, 1143 A.D. Vindhayavarma son Amushyavarma, Subhata-varma, son, Arjuna, living. It gives away the revenues of a village to a brahman family by the young raja Arjuna. It is remarkable for the frequent reference to the heroes of the

poems, and the absence of the usual reverential notices of the now popular hindoo gods. Firearms in the thirteenth century could not have been used, for the success in war of the princes are owing to flights of arrows. Subhatavarma appears to have destroyed Patna in Gujarat. The term Pergannah being used, the mahomedans must have previously arranged the districts. The capital of the princes was Mandu or Oojein.—*Vol. v, p. 377.*

PIPPALLY CATTY, the dried long pepper vine.

PIR, HIND. A mahomedan saint, a religious instructor. Pir zadah, son or descendant of a pir. Amongst the Kurds of Persia, pir is a title, though it means, literally, an old man.—*Layard's Nineveh, Vol. i, p. 302.* See Khajah.

PIRA, also Piri, HIND. A low bedstead used as a seat; also a seat fixed to a vaili or ekka, also a stand used by dyers.

PIRACY is described in the earliest Malay romances and is spoken of in glorifying the brave deeds of their ancestors. Piracy has always been frequent along the coasts of China. Pirates continue to infest the Sulu sea and the southern port of the Philippines. They come in the middle of the western monsoon and return in the beginning of the eastern monsoon. They seem to come mostly from Lanun Bay on the S. coast of Mindanao. Dampier, in 1686, calls them the Hilanoones, living in the heart

of the country of Mindanao. They are bold, but rarely attack European ships, generally the trading schooners manned by Malays. Their prahus, are open boats, about fifty feet long, twelve wide and four deep. They have a swivel throwing a one-pound ball, but their plan of attack is to throw themselves in overpowering numbers on board of their prey. The Dutch and the British have done something towards suppressing piracy, but the Spaniards nothing. In the Persian gulf, up to the present day, and on the western coast of India until the beginning of the nineteenth century, piracy had prevailed and about the year 1770, an extensive system of piracy prevailed on the Arakan coasts and in the delta of the Ganges. Magindano pirates every year with their long prahus, well-manned, visit some part of the Archipelago, robbing, destroying, killing or making captive all they meet with.—*Bikmore, pp. 318, 320; Wallace, Vol. ii, p. 29.* See Joasmi, Piratania.

PIRATANIA, a name proposed for North-eastern Indonesia, Formosa to the Sulu Archipelago and Mindanao, all included and embracing the Philippine and Basayan groups. Its southern part throughout is the great seat of piracy in the Indian Archipelago and includes Mindanao, Sulu, and the crowd of other islands extending from Mindanao to the N. E. coast of Borneo, and separating the Mindoro from the Sulu sea. See Piracy.

PIRENA, a genus of molluscs.

PIRHI, HIND. *Desmodium tiliaefolium.*

PIRI, TAM., a Ceylon tree which grows to about twenty feet in height, and two feet in diameter. Its wood is very close in its grain, and is used by the natives for the frames of vessels and in house work. It produces a fruit which is of no use.—*Edye on the Timber of Ceylon.*

PIRING, BENG. *Trigonella corniculata.*

PIROGUA, also Pirogue? a canoe formed of two trees united.

PIROPU KIRE, TAM. *Portulaca oleracea.*

PIR PANJAL RANGE, the name of the western mid Himalayas. The mass of this range, according to Vigne, is basaltic. Panjal is a Persian word signifying a range of mountains. Pansal, KASH., is a water station. The

Pir Panjal pass, from Tibet to Kashmir, called also the Sona Gulli, is open for foot-travellers from the 20th April, and for horses about 20th May. It is shut for 3½ months in the year. Hodgson, Herbert and the Gerards state 11,500 feet as the height up to which forest trees grow in Alpine India, east of the Sutlej. The Pir Panjal range of hills is visible from the Shalimar Gardens in Kashmir: their average height is about 15,000 feet. Mahomedans say the range derives its name from Panj, five, and Pir, saints, five pious brothers, having settled on it and performed several wondrous feats around; but the name seems to be Pansal, which, in the Kashmirian language, signifies a pass, and Pir, a devotee. Europeans and Persians call the whole mountain Pir Panjal, but the natives restrict the name to the pass. To them mountain chains offer nothing remarkable, while the passes leading through them are of some importance. So also are isolated mountains, when they serve as land-marks, or are deemed holy as places of pilgrimage. In general they give no name to any other.—*Baron Hugel's Travels in Kashmir and the Punjab*, p. 114. See Pijnal.

PIRTHIRAJ, a hindoo ruler of great celebrity, who amalgamated the Somara and Chohan races in one body and perpetuated the two lines in one prince. He was born in the year 1154 and was sixteen years of age when he succeeded his maternal grandfather and sat himself on the throne of the Anangos. The first princess married by Pirthiraj was the daughter of the Dahima of Biana, a city, the castle of which was built on the topmost peak of Druinadaher, to resemble the Kilasa of Siva. He enlarged the circle of his alliances, till there gathered round his throne one hundred and eight chiefs of the highest rank in India, and his sway became the most powerful in the land. In the height of his power, Pirthiraj celebrated the Aswamedha, the most magnificent of all the regal rites enjoined to the hindoo by his shastras. By one account it was on the occasion of this ceremony that Pirthiraj forcibly carried off the princess Sanjogata in open day from the capital of Jhy Chand, a feat, the heroism of which forms the subject of the Kanouj Khand of the Pirthiviraj Chohan Rasa of the poet Chand. The princess of Kanouj was not only remarkable for her personal charms but formed the most perfect model of Rajput female character in her day. No sooner did Pirthiraj arrive with her at Delhi, than he abandoned himself to her influence. The seductive charms of the enchantress lulled the monarch for a time into a neglect of every princely duty. The date of this abduction is A. D. 1175. Pirthiraj afterwards undertook the conquest of Mahoba, or the present Bundelcund. Mahomed Ghori had

penetrated as far as Lahore, and in 1191 he set out to attack the raja of Delhi, the outwork and bulwark of Indian sovereignty. The hostile armies met at Silouri between Thanesar and Kurnal on the great plain, where most of the contests for the possession of India have been decided. The hindoo raja was well prepared for defence, and defeated the mahomedan forces. Within two years, however, the Ghorian again encamped on the bank of the Caggar. The brave Samarsi, fell, together with his son and all his household troops. Chaond Rai, the gallant Dahima, perished with the whole chivalry of Delhi. Pirthiraj himself was taken prisoner, and put to death in cold blood. Then followed scenes of devastation, plunder and massacre, that have too often been enacted in Delhi. None survived excepting the bard Chand who alone remained to sing the requiem of his nation's fall. Chand, the last heroic hindoo poet of India, was the author of the Pirthivi Raj Chohan Rasa, containing an account of Pirthivi raja, a Chouhon Rajput, the last hindoo prince of Delhi. It has many books, of which the Kanouj Khand contains the history of Sanjogata Jye Chand who celebrated the Aswamedha sacrifice in token of assumption of empire.—*Tr. of Hind.*, Vol. ii, pp. 164 to 169. See Inscriptions, Jye Chand, Pirthivi, Sanjogata.

Drek, Goorgoo, KASHAN.		Shne, Masna,	"
Kakkeran, Toongoo, RAVI.			

This ornamental tree grows in many places in the Panjab Himalaya from 1,500 to 5,500 feet, also in Hazara and Affghanistan. Its zebra coloured wood is in great demand amongst Europeans for chairs and cabinets: it is also made into oil mills. The leaves and young shoots are browsed. The excrescence is given in coughs and the fruit in indigestion. The kakra-singhi is a large hollow, horn-like curved gall, with a tawny brown rough exterior. It is considered hot, dry and astringent, and is used by natives in coughs and asthma, fever, piles and dysentery. It is also said to allay vomiting, thirst, and difficulty of breathing.—*Dr. Cleghorn; Dr. Stewart; Mr. Powell's Handbook, Vol. i, p. 338.*

PISTACIA LENTISCUS, *Linn.*

Mastika,	AR.	Roomi mastiki,	HIND.
Uluk-bagh-danu;	"	Koondoor roomi,	"
Kinnah,	"?	Kinnah,	PRS.
Mastich tree,	ENG.	Kinnoli,	"

A native of the south of Europe and of north of Africa and of Asia Minor, introduced into the Calcutta Garden in 1806. The bud, bark, leaves, and fruit have all been used in medicine, but have been laid aside in modern times. The bush is found on the coasts of the Mediterranean. The leaves are evergreen, fruits very small, pea-shaped, reddish when ripe.

The resin.

Gum mastic,	ENG.	Ulmastiga,	SP.
Mastic resin,		Kinnoli,	TURK.
Turkish olibanum,			

PISTACIA VERA.

The sweet fragrant stimulant resin, called mastic, is obtained from the trunk by incisions made in the month of August. It is used to strengthen and preserve the teeth and in diarrhoea. It occurs in oval tears of variable size, smooth, diaphanous, brittle, breaking with plane, brilliant, glassy, and pale yellow surface, and owing to its brittleness being usually covered with its own dust. Its odour is agreeable; flavour weakly balsamic; it softens in the mouth, and becomes ductile like white wax. It melts at a moderate heat, and then exhales a sweet odour. Mastic is quite insoluble in water, it yields to alcohol 80 per 100 of soluble matter, leaving a substance resembling caoutchouc, which is slowly dissolved by ether. This resin gives its name to the process of mastication, being universally chewed in the East; it is much used by dentists for filling up carious teeth; it is burned as incense; and in some parts of Greece it is added to bread in small quantities to give it an agreeable flavour. Mastic is extensively employed as a transparent varnish, dissolved in turpentine or alcohol, with other resinous bodies. A species of mastic called tum is obtained in Africa from the Pistacia atlantica. The true resin is sold in all the bazaars for about three rupees the seer. It is used by hakims in diseases of the stomach or liver; also as a masticatory. It comes from Cabul, but the best is said to come from Turkey and the Levant, hence called "rumi."—*Roxburgh*; *O'Shaughnessy*, p. 278; *Powell's Hand-book*, Vol. i, p. 338.

PISTACIA TEREBINTHIUS.

Terebinthus vulgaris.

Katinge roomi,	ARAB.	Zungbari,	PERs.
Butum,	"	Sukhur,	(Royle.)

A native of Barbary, Greece, and the south of France. A resinous juice of much value is afforded by this tree.—*O'Shaughnessy*, p. 276.

PISTACIA VERA, Linn. Pistachio tree.

Fistak,	HIND.	Pista,	HIND.
---------	-------	--------	-------

A plant of Persia, Syria, N. Turkistan, S. of Europe and Koh-i-kush, Bokhara, Cabul, mid-Asia. It yields the pista or pistachio nut, and the gall known as Gool-i-pista, Baz-ghanj or Bozaganj used as an astringent or dye for silk.

Galls.

Gul-i-pista

| Pista-ka-phul.

The galls are imported into Bombay from the Persian Gulf, and are used in medicine by the natives of India. By the hindoo physicians the fruit is considered a warm and moist remedy, the kernel contains much oil and acts as a demulcent and restorative. It is principally used in special diseases. The bark is employed as a tonic in indigestion. The galls act as astringents and are used in diarrhoea. According to Mr. Elphinstone it grows wild in the Hindu-Kush. The almond and the pericarp are imported

PISUM SATIVUM.

into India from Cabul, with a kind of gall termed Gool-i-pista and a resin called Alook-ul-imbati.—*O'Shaughnessy*, p. 276; *Royle's Ill. Him. Bot.*, p. 178; *Faulkner*; *Birdwood*; *Powell's Hand-book*, Vol. i, pp. 337, 338. See Gulpista.

Under ghunga,	DUK.	Agasi-tamare,	TAM.
Toka pana,	HIND.	Antara tamara,	TAM.
Taka pana,	"	Akasu tamara,	"
Kodda pail,	MALEAL.	Niru budlki,	"

An aquatic, stemless, plant, growing in all tanks and ditches. Its juice is given medicinally. It is said to occasion dysentery to those who drink the water. The natives of several districts of Southern India were in the habit of using the fresh living plants of the Pistia stratiotes or Agasi-tamaray for attracting and stupefying bugs, but large quantities of this plant were collected and tried in several hospitals and public institutions and found useless.

PISU, HIND. Flea.

PISUM ARVENSE, Wight.

Keia,	BENG.	Mattar rewari,	HIND.
Bisillah,	EGYPT.	Kala mattar	KAGHAN.
Field pea,	ENG.	Karani,	KASHM.
Mattar,	HIND.	Kulawan,	SIMLA.

Cultivated throughout India, sown after the rains in drills, and varies in price according to the quality; when green, they are tolerable as a vegetable, but are best in soup. Procurable in December and January.—*Riddell*.

PISUM SATIVUM, Linn.

var. α macrocarpum, Ser., Sugar pea.

var. β quadratum, L., Chota-mutur, Grey pea.

var. γ agreste, Patna pea, common field pea.

Khandoo; Sen,	BEAS	Watana,	MAHR.
Burra-mutur,	BENG.	Kachang,	MALAY.
Common pea,	ENG.	Harensa,	SANS.
Pea,	"	Rata-gora-dya,	SINGH.

Mutur,	HIND.	Pattani,	"
Batanah,	"	Patanlu,	TEL.
Batani,	"	Goondoo sanigheloo,	"
Shanma; Ahandil,	LADAK.		

This is the common pea of our fields and gardens. Cultivated throughout the plains of India, but grows in the N. W. Himalaya up to 14,000. At the latter height it does not ripen its seed. It is found in the Sutlej valley between Rampur and Sunnam at an elevation of 8,000 to 14,000 feet. Cultivated in Kunawar and Spiti. 100 parts of the pea from Benares, yielded:

Moisture ..	12.70	12.60
Nitrogenous matter ..	25.20	21.80
Starchy matter ..	58.38	62.19
Fatty or oily matter ..	1.10	1.12
Mineral constituents (ash) ..	2.53	2.29

—*Ainslie*, p. 244; *Eng. Cyc.*; *Cleghorn's Punjab Report*, p. 66.

PISURI, Pisora, Pisai, HIND., MAHR. *Melasma indica*, *Jerd.*

PIT, HIND. Bile.

PITA, TAM. Aloe or Agave fibre.

Cantala, Banskora, HIND. | Petha kalabuntha, TAM.

The species of Agave, commonly called aloe plants, are natives of America, which have become so naturalised in many parts as to appear to be indigenous in Africa, parts of India, and in the south of Spain. The Agave plants, to which the name of American aloe is so frequently applied, resemble the true aloe in their sword-shaped leaves with parallel veins, which, however, grow to a gigantic size—that is, from eight to ten feet in length—in a cluster from the root, with their margins usually armed with short thorns, and their points with a hard and sharp thorn, which makes them useful hedge plants, the leaves abound in fibres of great length of considerable strength, also tough and durable. The Mexicans made their paper of the fibres of agave leaves laid in layers. The expressed juice of the leaves evaporated, is stated by Long, in his 'History of Jamaica,' to be also useful as a substitute for soap.—*Royle, Illustrations of Himalayan Botany*, p. 375; *Humboldt, in his Political History of New Spain*, (book iv, c. 9.) quoted in *Royle Fib. Plants*, p. 4.

PITA CHANDANAM, TEL. Santalum —? In the original, this word is accompanied by the following note 'yellow sandal' produced in the mountains of Malabar, *W.*,

PITAK, see Indus.

PITAL, HIND. Brass.

PITALEE - JAMAI - POOLISHIM, BENG. Lablab cultratus.

PITALI, TAM. Brass colour.

PITAMBAR, HIND. A yellow amber coloured cloth, or soft silk dhotee, ten yards long, forming both a skirt and a body covering or worn by men as a dhotee. Its name is said to be from Pit, bile and ambar, amber. The silk sarees and 'pitambars' or men's silk waistcloths, are worn by hindoos at entertainments and festivals, as also in religious worship. Sarees are nearly universal for hindoo women's wear, and soussee, made into petticoats and trousers, is as universal for mahomedan women and men also, and it has this advantage over sarees, that the colours and patterns differ very little anywhere within the confines of India: whereas sarees, dhotees and loongees must be made to suit particular localities, and the patterns of one locality would inevitably be rejected in another.

PI-TANDALA KOTTI, MALAL. *Crotalaria verrucosa*, *Linn.*

PITAR. Father, is derived from a root Pa, which means, not to beget, but to protect, to support, to nourish. The father as genitor,

was called in Sanscrit ganitar, but as protector and supporter of his offspring he was called pitar; hence, in the Veda, these two names are used together, in order to express the full idea of father. Thus the poet says:—

Dyaus me petā ganitā,
Jovis mei pater genitor,
Zeus ἐμὸν πατὴρ γε γενίτηρ.

In similar manner, matar, mother, is joined with ganitu, genitrix, which shows that the word matar must soon have lost its etymological meaning, and have become an expression of respect and endearment. For, among the early Arians, matar had the sense of maker, from ma, to fashion. In the Non-Aryan nations of Europe and Asia, the terms are,

PITCH.

Sung-shu-kau,	CHIN.	Pece,	Ir.
Brai; Poix,	FR.	Smola-gust aja,	Rus.
Pech,	GER.	Pez,	Sp.
Pitch,	Guz., HIND.		

Pitch is the residuum of tar, inspissated by heat or boiled down to dryness. In China, black dammar and impure elemi are used as substitutes for pitch. In British India the black dammar is used similarly.—*McCulloch*.

PITCHA, TEL. *Cucurbita citrullus*.

PITCHA GHADI, SINGH. *Cucurbita citrullus*, *Linn.*

PITCHA PUSJHUM YENNAI, Tam. Melon seed oil.

PITCHA SHAKARA KOMATI, also Pitchakai, also Pitchi pallam, Tam. *Cucurbita citrullus*, Linn.

PITCH BLENDE, a ponderous metalliferous ore, of a blackish colour, much valued by porcelain painters, found in Saxony, Bohemia, Hungary and Cornwall.—*Waterston; Faulkner.*

PITCHER PLANTS, of the Pitcher plant tribe, are of the natural order *Nepentaceæ*. Of these there are several species in Ceylon, the Khassya, the Malay peninsula, Sumatra, Java and Borneo. Pitcher plants are quite common near Mount Ophir in Malacca. The pitchers of those in Malacca, contain about half a pint, beautifully ciliated with large ciliae, the broad pitcher—for this, like the *Rafflesiana*, produces two kinds—is generally crimson; the long pitcher differs from the other in its trumpet shape and green colour, which is spotted with crimson. The leaves, are moderately large and broad—at least those of them which produce the broad pitcher, and which are found near the base of the plant—are dark green above, and of a fine peach-coloured red beneath. The *Nepenthes ampullacea* produces green or spotted short and broad pitchers, it is also a climbing plant, and found in thick jungles. The old stems, falling from the trees, become covered in a short time with leaves and vegetable matter, which form a coating of earth about them; they then throw out shoots which become in time new plants; but apparently the first attempts to form the leaf are futile, and become only pitchers, which, as the petioles are closely imbricated, form a dense mass, and frequently cover the ground as with a carpet of these curious formations. As it continues growing and endeavouring to become a plant, the laminae of the leaves gradually appear, small at first, but every new one increasing in size, until finally the blades of the leaves are perfect, and the pitchers, which, as the leaves developed themselves, have become gradually smaller on each new leaf, finally disappear altogether when the plant climbs into the trees. This formation of the pitcher may afford an instructive lesson to the naturalist, as, though not to the same extent, the principle is perceptible in all of this curious tribe, the

of seedlings and weak plants always producing the largest pitchers. The best known to Europeans is *Nepenthes distillatoria*, Ait., of the Khassya mountains, it is the *N. phyllam-pora* and *N. indica*, Lam. None of the plants of Borneo so much attract curiosity as the various and beautiful pitcher-plants, eight different species of which were discovered in the western part of the island. The pitch-

ers, which in some instances would contain upwards of a pint of water, hang from the mid-rib of the leaf of which they are a formation; they precisely resemble pitchers, being furnished also with a lid. The *Nepenthes Rafflesiana* produces its pitchers singly; they are large and generally crimson: it grows on rocky islands in the neighbourhood of Singapore, and it is easily distinguished from its near ally the native of Borneo and Mount Ophir by its inferior size, shortness of the column which supports the lid, the white and powdered appearance of its stems, and its bushy habit, never exceeding four or five feet in height, while the largest Bornean one, which was called *Nepenthes Hookeriana*, in honour of Sir W. J. Hooker, the able director of the Botanic Gardens at Kew, is found growing in deep and shaded jungles, climbing to the tops of the trees. The pitcher is nine inches in length, having a large lid standing on a column, which is a continuation of the beautiful edge of the pitcher: that part which is broadest and turned towards the mid-rib of the leaf from which it depends, is furnished with two broad wings.—*Wallace, Vol. i, pp. 31-2; Low's Sarawak, p. 68.*

PITCHI PALLUM, Tam. *Cucurbita citrullus*.

PITCHING COAL or Caking coal, see Coal.

PITH, the Sola or Shola of Hindustan, is obtained from the *Meschnomene aspera*. At the Madras Exhibition of 1855, the Trichinopoly Local Committee exhibited a large collection of figures and architectural models, carved in the pith of the *Typha*. The attitudes of the figures were stiff but the draperies characteristic. Also 'ith work made from the rushes called "Nultee" in Tanjore.

PITHA, PANJAB. *Benincasa cerifera*—*Savi, W. & A.*

PITHA-KALABANDA, Tam. *Agave vivipara*, Linn.

PITHECOLOBIUM SUBCORIACEUM, Thw.

Meemini marn, Sina.

A large tree 30 to 40 feet high, growing, not uncommon, at an elevation of 4,000 to 6,000 feet in the central province of Ceylon: wood unknown.—*Thw. En. Pl. Zeyl., pt. ii.*

PITHECUS, the Orang-utang. The following species are known.

Pithecus brookei, Bl. *P. Wurmili* et *P. Abellii*, Owen (though neither the species described by Van Wurm, nor that by Dr. Abel, the Mias, Rambli, Malay, Brooke. A native of Borneo.

Pithecus curtus, Blyth., a species of Orang-utan. The Mias Chapin of the Dyaks.

Pithecus curtus, Blyth. Mias Chapin, MALAY. A Borneon species of Orang-utan.

Pithecus morio, Mias Kassan, MALAY. A Borneon species of Orang-utan.

Pithecus morio, Owen. Mias Kassan, MALAY, Brooke, from Borneo.

Pithecus Owenii, Bl., small Orang with short fore-arms. Adolescent female Hab. unknown.

Pithecus satyrus, L., apud Brooke, S. Müller, and others; *Blyth*. Mias Pappan, MALAY, Brooke, from Borneo. A species of Orang-utan, in Borneo.

Pithecus syndactylus, see *Hylobates agilis*. — *Ben. As. Soc. Journ.*, No. 4, p. 383.

PITHEX OINOPS, Hodg., Hors. Syn. of *Inuus rhesus*, Jerdon.

PITI, HIND., pulse ground up into a fine paste with water.

PITI and Hungrang are two valleys. That of the Piti river is entered from Kunawar by the Hungrang pass, elevated 14,800 feet: the Parang pass is 18,500 and leads over the range dividing the Parang from the Piti rivers. The district of Piti, which was formerly almost independent, but paid tribute to, or exchanged presents with, all the Tibetan countries in its neighbourhood, namely, with Garu, Ladak, and Lahul, as well as with Kunawar, followed, in 1846, the fortunes of Lahul in being transferred to British rule. It is a very thinly populated valley, the villages being small and distant, and the arable tracts of no great extent. The mountains on its southern border, by which it is separated from Kunawar, are so very elevated that they entirely intercept all access of humidity from the districts to the northward of them, and render the climate entirely rainless. The houses are in consequence very generally built of unburnt bricks, made of the fine lassicrine clay so common in the valleys, and their flat roofs are thickly covered with a layer of the same material. The gradual transition, in ascending the Sutlej, from hinduism to buddhism, is very remarkable, and not the less so because it is accompanied by an equally marked change in the physical aspect of the inhabitants, the hindoos of the lower Sutlej appearing to pass by insensible gradations as we advance from village to village, till at last we arrive at a pure Tartar population. The people of Upper Piti have quite the Tartar physiognomy, the small stature and stout build of the inhabitants of Ladak, to whom also they closely approximate in dress. To what extent mere climatic influences may cause these differences, and how far they depend on an intermixture of races, it is difficult to decide. It is impossible, however, to avoid being struck by the coincidence between these physical and moral changes in the human race, and the gradual alteration in the forms of the vegetable world, which are observable as we advance from a wet to a dry climate.—*Dr.*

Thomson's Travels in Western Himalaya and Tibet, p. 109; *H. f. et. T.*, 223.

PITMALTI, HIND. *Jasminum revolutum*. PITNI, or Fitni HIND., of Kaghan, *Zizyphus vulgaris*, common jujube.

PITOLU, URIA.? A tree in Ganjam and Gumsur, extreme height 30 feet, circumference 2 feet, and height from the ground to the intersection of the first branch, 6 feet. Abounds, but is only burnt for firewood.—*Captain Macdonald*.

PITOLI, BENG., HIND. *Trewia nudiflora*. PIT PAPRA, HIND. *Fumaria parviflora*, W. & A., also the flat seeds of the *Butea frondosa*, or dhak.

PITRA, HIND. Acetate of copper. PITRA PAKSHI, from Pitra, paternal ancestors, the Patrii of the Romans, is a hindoo festival about the end of September, on the last day of Bhadra pad or first day of Ashwin, on which offerings of fire and water are made to the manes of deceased ancestors.

PITRAS, HIND. *Curcuma longa*. PITREE-MEDHU, SANS., from pitree, forefathers, and medhu, flesh. The early fathers, the progenitors of the human race, their manes, the dii patrii of the Romans.

PITRI, fathers of the Stars. PITRI, in Brahmanism, the soul of a deceased ancestor. The Pitri are the names of ancestors to whom Sraddha are performed. They are the Feriali of the Romans.—*Wilson*.

PITRI. The Aryan divinity of food. PITRI-ISWARA the worship of the ancestral manes, the Pitri-iswara, or father-gods of the Rajputs, continues for fifteen days. The rana of Mewar goes to the cemetery at Ara, and performs at the cenotaph of each of his forefathers the rites enjoined, consisting of ablutions, prayers, and the hanging of garlands of flowers and leaves sacred to the dead, on their monuments. Every chieftain does the same amongst the altars of the "great ancients" (burra boora); or, if absent from their estates, they accompany their sovereign to Ara. See Dharma-rajah.

PIT-SAL, HIND. *Pterocarpus marsupium*. PIT-SHOLA, HIND. *Pterocarpus marsupium*, *Rosb.*

PITSJEGAM-MULLA, MALBAL. *Jasminum grandiflorum*.

PITSO, HIND. *Arundinaria falcata*.

PITTA, TEL. Bird.

PITTA, a genus of birds, see Birds.

PITT Mr. Thomas, a Governor of Madras, in 1702.

PITTA CONCINNA, a ground thrush of Lombok. It has puffy plumage and lovely colours, is timid and wary.

PITTA and Kaloochia, URIA. Pitta, a tree of Ganjam and Gumsur, extreme height 36 feet,

circumference 3 feet, and height from the ground to the intersection of the first branch, 15 feet. Pitta used for posts, ploughshares and firewood as the kaloochia, but is a larger tree and very plentiful.—*Captain Macdonald*.

PITTALATA, Sans. Verdigris.

PITTAPOOR, a large zemindary in Rajah-mundry.

PITT or Regent diamond. See Diamond.

PITT STRAIT, called Sagewyn by the Dutch, is bounded on the north by Battanta Island, and on the south by the north coast of Sallawatty and the group of small islands stretching from thence to the adjacent coast of New Guinea. Its length is about 39 or 42 miles, and its greatest breadth is about 7 or 8 miles.

PITT STRAITS and Dampier Straits are separated from each other by Battanta island.

PITTAM, Tam. Bile.

PITTA MARRI or Konda marri, TEL. Ficus tomentosa, R. iii, 550—W. I. c. 647.

Celastrus verticillatus, Roxb. Fl. Ind. i, 391.

Senecia napaulensis, DC. Prod. i, 347. c. p. 476.

Katteya-gass, SINGH.

A moderate sized tree of the Oova district of Ceylon growing at an elevation of 3,000 to 5,000 feet.—*Thw. Enum. pl. Zeyl. Vol. i, p. 68.*

PITTAL, a cultivating race in Rajputana, who are supposed to be Kurmi under another name, *Campbell, p. 93.*

PITULEE, Beng. Trewia nudiflora.

PITULEE-JAMAI-PULI-SHIM, Beng. Lablab cultratum. L. gladiatum.

PITZ, KASHMIR. Typha angustifolia, Linn.

PIU, or Pihu, or Pisu, HIND. A flea.

PIUMAR, HIND. Plectranthus rugosus.

PIUME, It. Feathers.

PIUN, HIND. Aconitum napellus.

PIYA-BANSI, Beng. Dendrocalamus tulda (larger variety.)

PIYA-DASI, a name of Asoka. See Inscriptions.

PIYAL, Beng. Buchanania latifolia.

PIYAL, ANGLO-TAM. For pandal, a verandah; the piyal-schools are open air schools, held in some person's verandah.

PIYAL-SHAL, Beng. Terminalia tomentosa.

PIYALEE, Beng. Buchanania latifolia.

PIYAZ, HIND. Allium cepa, the onion.

PIYAZI RANG, HIND. Very pale pink or flesh coloured.

PI-YUEN, CHIN. Spelter.

PIX ABIETINA, see Turpentine.

PIX ARIDA, see Frankincense.

PIX LIQUIDA, LAT. Tar.

PIZARRA, Sp. Slate.

PIZZI, It. Lace.

PIZHDER in the northern mountains, near Sakinah on the frontier of Persia, the original seat of the Kurd clan called Babbah, Bebbeh or Baban.

PLA, HIND. Butea frondosa.

PLACUNA, a genus of shells. Placuna placenta, the window shell, is found in great abundance in the Taumalegam lagoon near Trincomalee, and their collection is rented out, 18 millions been collected annually. The shells are exported to India and China as a substitute for window glass, and small pearls are found in them. They do not occur on the coast of the peninsula of India, but are found fossil, in the tertiary strata of the eastern coast line.

PLACUNANOMIA, a genus of shells.

PLAGIOSTOMATA an order of fishes of the sub-class Chondropterygii which may be thus shown:

SUB-CLASS IV. CHONDROPTERYGII.

ORDER I.—Holocephala.

FAM. 1. Chimaeridae.

Chimaera monstrosa, L., Europe, Cape, Japan.
Callorhynchus antarcticus, Lacep., S. Pacific, Cape.

ORDER II.—Plagiostomata.

First sub-order, Selachioidei.

Gadang,	JAV.	Ariti pandoo,	TEL.

Plantain is the name applied to various species of the genus *Musa*, of which the best known species are *M. paradisica*, which yields the edible plantain or banana and *M. textilis*, the Manilla hemp plant. The bananas appear to be natives of the southern portion of the Asiatic continent, (R. Brown, “Bot. of Congo,” p. 51.) Transplanted at an unknown epoch into the Indian Archipelago and Africa, they have spread also into the new world, and in general into all intertropical countries, some-

times before the arrival of Europeans. Humboldt put a very high value on this fruit, as an article of food. According to him it affords, in a given extent of ground, forty-four times more nutritive matter than the potato, and 133 times more than wheat. These figures must be considered as only approximative, since nothing is more difficult than to estimate the nutritive qualities of different aliments, and in the East Indies it is only used as a dessert. In Jamaica, Demarara, Trinidad, and other colonies, however, many thousand acres are planted with these trees. The vegetation of this tree is so rapid that if a line of thread be drawn across, and on a level with the top of one of the leaves, when it begins to expand, it will be seen, in the course of an hour, to have grown nearly an inch. The fruit when ripe is of a pale yellow, from two or three inches to a foot in length and two inches thick, and is produced in bunches so large as each to weigh 40 lbs. and upwards. In the Straits Settlements, the most approved varieties are the royal plantain, which fruits in eight months; one which bears in a year, the milk plantain, the downy plantain, and the golden plantain or banana. A variety termed Guindy was imported from Madras, where it is in great esteem. It has this advantage over the other kinds, that it can be stewed down like an apple while they remain tough. The Malays allege that they can produce new varieties, by planting three shoots of different sorts together, and by cutting the shoots down to the ground three successive times, when they have reached the height of nine or ten inches. In some districts of Mexico the fruit is dried in the sun, and in this state forms a considerable article of internal commerce under the name of "plantado pasado." When dried, and reduced to the state of meal, it cannot, like wheat flour, be manufactured into macaroni or vermicelli, or at least the macaroni made from it falls to powder when put into hot water. The fresh plantain, however, when boiled whole, forms a pretty dense firm mass, of greater consistency and toughness than the potato. The mass, beaten in a mortar, constitutes the foofoo of the negroes. The plantain meal cannot be got into this state unless by mixing it up with water to form a stiff dough, and then boiling it in shapes or bound in cloths. The fibre of the stem is equal in texture, clean and aromatic. Although perhaps there is no province in India in which plantains are grown to so great an extent as in Pegu, yet there are scarcely any good plantains to be had in that country. This is owing to the Burmese habit of only eating green fruit, and their total indifference to the finer qualities of flavour. The great use of all fruit

with the Burmese is to serve as an addition to their curry, for which purpose one kind of plantain is just as good as another. The plantain or banana, holds the same place in Tenasserim that the apple does in England and the United States. It is used as a vegetable as well as an article for the dessert, the great proportion being eaten with rice and meat in the place of potatoes. There is perhaps no plant of which so many preposterous things have been carelessly written in books of travels, and then copied into works of graver character than this. Among other things equally veritable, it has been said, "three dozen plantains are sufficient to serve one man for a week instead of bread, and will support him much better." A Karen told Mr. Mason that he often eats ten at a time, and a hundred would not be sufficient for a man one day if he had nothing else, unless they were very large. Like the mango, the tree is indigenous in Tenasserim, but the wild fruit is too full of seeds to be eatable. The plantain and banana embrace many varieties, Mr. Mason had the Burman names of twenty-five before him. "The numerous varieties," writes Voigt, "we have in vain tried to put in some order. The attempt made for this purpose, in Schultens, appears to us to have only increased the confusion." The Manilla hemp, from which a fabric of the finest texture is prepared, is made from the leaves of the *Musa textilis*. Another distinct species of this genus grows wild in Tenasserim jungles, and is rather an ornamental plant, which is all that it has to recommend it. Unlike the common plantain it never throws up shoots from its roots. Several varieties of the banana are cultivated in the Dekkan,—the large red, the green and the yellow. A small sort, which is supposed to be the real banana of the West Indies, is perhaps the most luxuriant. The plants blossom at all seasons, and so soon as the drupe of fruit begins to ripen, which is known by some turning colour, it is cut and hung up to ripen in the house. The plant will not bear again, and if not cut down it will perish of itself, when the surrounding shoots grow up and blossom as the former. The plants are generally grown in beds or clusters in a good rich soil, when fine fruit is almost the sure return. In transplanting the shoots, of two or three feet high, about one-half is generally cut off, the green fruit is used in curries; the natives of the peninsula of India also use in their curries, the extremities of the flower shoots, the heart of the stem, and that portion of it from which the roots proceed. The stem yields a fine white silky fibre of considerable length, specifically lighter than hemp, flax and aloë fibre, by 1-4th or 1-5th and possessing considerable strength. The plant is cultivated

everywhere in the Southern India, where there are numerous varieties,

Rustaley, superior table plantain.

Poovaley, or small Guindy variety.

Payvaley, a pale ash-coloured sweet fruit.

Monden, 8-sided coarse fruit.

Shevaley, large red fruit.

Putchay laden, or long-curved green fruit.

These yield fibres of very different quality. At the Madras Exhibition of 1855, very fine specimens of this fibre were contributed by the Local Committees of Masulipatam, Tanjore, Malabar, Canara, Nellore and Travancore, and very carefully prepared plantain fibre, hackled ditto, yarn, string, rope, tow and half stuff for paper were exhibited by the Madras School of Industrial Arts. This plant has a particular tendency to rot and to become stiff, brittle and discoloured by steeping in the green state, and it has been ascertained by trial that the strength is in proportion to the cleanness of the fibre. If it have been well-cleaned, and all the sap quickly removed, it bears immersion in water as well as most other fibres, and is about the same strength as Russian hemp. The coarse large fruited plantains yield the strongest and thickest fibres, the smaller kinds yield fine fibres, suited for weaving, and if carefully prepared, these have a glossy appearance like silk. This gloss, however, can only be got by cleaning rapidly, and before the sap has time to stain the fibre, it is soon lost if the plant be steeped in water. By far the greater number of specimens of plantain fibre exhibited at the Madras Exhibition of 1855 were discoloured from steeping, and they had acquired a dull ash-grey or brown-colour, which, in this plant, is always accompanied by stiffness and brittleness; one or two of the specimens were so brittle as to break when gently rubbed; others were harsh and stiff. Some well-made rope, line and string were exhibited by several of the Local Committees. The Travancore Local Committee exhibited some excellent fibre and rope, the latter very carefully laid up but stiff from over-twisting. This kind of rope ought not to be hard spun, as it becomes stiffer when wet and is liable to snap if it get into a twist or knot. Almost every part of the plantain, may be converted into fibre, but it most abounds in the stem and leaves, and can be made available for textile or cordage purposes. The combings or tow separated during the preparation of the fibres is of value as a substitute for horse hair, for stuffing mattresses, &c., and the peduncle of the core can be pounded into half stuff for the paper-makers and form an excellent material for the finest or the toughest kinds of paper. In the West Indies the spiral vessels are employed as tinder. In the

process of separation, the stem should be cut down six inches above the ground, and then divided longitudinally into four parts, and the juice expelled by passing each slip longitudinally through the common sugar mill with grooved hard wood rollers or a mill, the rollers of which are three feet long and one foot in diameter. In the process of crushing, the stalks and the harder and softer parts of the stem should be passed through separately, which can be easily effected if the rollers be horizontal. In this way, the produce will be four or five pounds of fibre from each tree. The fibres from the midrib of the leaf are the best, and in general if the stem yield four pound nett of fibre the stalk will give 1 lb. out of four. After the crushing, the fibres are to be well washed and boiled in soda or other alkaline ley to separate the gluten and colouring matter, keeping the fibres from the several parts quite separate, in this process of boiling. They are then bleached and the highest coloured fibres do not require more than six hours, but the darkest, from twelve to eighteen. The fibre from the stem is fine, white, and silky, of considerable length; specifically lighter than hemp, flax and aloe fibre, by $\frac{1}{4}$ th or $\frac{1}{2}$ th and possessing considerable strength. The fibre of this plant rapidly rots and becomes stiff, brittle and discoloured by steeping in the green state, and it has been ascertained by trial that the strength is in proportion to the cleanness of the fibre. If it have been well cleaned, and all the sap quickly removed, it bears immersion in water as well as most other fibres, and has about the same strength as Russian hemp. The coarse large-fruited plantains yield the strongest and thickest fibres; the smaller varieties are suited for weaving, and if carefully prepared, these have a glossy appearance, like silk. But this glossy appearance can only be got by rapid cleaning, before the sap has time to stain the fibres, and it is lost soon if the plant be steeped in water. It can be made into string, line, or rope, and manufactured into cloth. The fine grass cloth, ship's cordage, and ropes used in the south-sea whale fisheries, are said to be made from the fibres of varieties of Musa. As in all the plantain tribe, the leaves yield the thickest and strongest fibres. The finest plantain fibre when carefully cleaned and dressed, in what may be termed the "fresh process," in contradistinction to the system of rotting the fibres free, has been said to be well suited for the imitation of silk in carriage braid and carpet work. The average value put upon such fibres was said to be £70 per ton, when Russian hemp was selling at £50 per ton. In the West Indies, the total expense of producing a ton of fibres, is calculated at £9 13s. 4d. The wild fruit is not edible, from its containing

PLANTAIN.

many seeds. On the Arracan coast, the layers of the stem of the plantain, termed there Pa-tha-you-sha, are sold in a dried state, some of it is even twisted into a bast rope. It would probably command a good price as a cordage or paper material, or for textile fabrics.

The Leaves.

Valei elley, TAM. | Maoz ka pat, DUK.
The leaves are used in regimental hospitals, for dressing parts that have been blistered, and men's backs, after punishment.

The Meal

Is prepared by stripping off the husk of the fruit, slicing and thoroughly drying the core in the sun, after which it is powdered and sifted. It has a fragrant odour—and its flavour is said to depend a good deal on the rapidity by which the slices are dried. It should be husked and sliced by nickel or bamboo knives, as those of steel injure the colour of the meal. It is calculated that the fresh plantain will yield 40 per cent. of meal, and that an average bunch of 25 lbs. weight will yield 5 lbs. and that an acre of plantain walk of average quality producing 450 bunches during the year, would yield upwards of a ton of meal. In the West Indies plantain meal is largely employed as the food of infants, children and convalescents. In composition the plantain fruit approaches most nearly, in nutritive quality to the potato, and the meal of the plant to that of rice: the following are the proportions of starch, sugar, &c., and protein compounds, on which depend their nutritive quality.

	Rice.	Potato.	Plantain.
Starch, Sugar, &c..	87-4	79-0	86-0
Protein Compounds.	7-5	8-0	5-2

In South America the fruit is not only used as an article of diet in its fresh state, but, when dried, forms an article of internal trade, besides having its flour separated, and cooked or made into biscuits. It is also preserved in the Society Islands.

The skins.

Valei palum tole, TAM. | Ariti pandu tolu, TEL.
These, as also lime skins, are used by the chucklers in dying leather black. Some plantain meal was sent to the Exhibition of 1851, from Madras, as well as baked Plantains from Jessore, by the Reverend J. Parry. These, after some years, were still in good preservation and well tasted. The late Dr. Stokes, informed Dr. Royle that the plantains at Bassein, where the cultivation is most extensive, are delicious in flavour, and that there the people had acquired the art of preserving them. But this was practised many years ago in Central India, and in Ceylon in 1840, the late Sir John Robison, Secretary of the Royal Society of Edinburgh, wrote to Dr. Royle mentioning the banana, the varieties of which are rich in saccharine matter, make an admira-

PLASSEY.

ble preserve, on being skinned and split longitudinally and dried in the sun, by which process they immediately acquire a consistence like Turkey figs, and become capable of being packed and preserved in the same way." He was in the habit of having large quantities preserved every year in this way at Hyderabad, and of using them as an article of dessert at table."—*Surgeon T. Key, in the Proceedings of the Madras Committee; Madras Exhibition Juries Reports; Royle's Fibrous Plants; Simmond's Commercial Products; Dr. Alexander Hunter in M. E. Proceedings; Dr. Mason's Tenasserim; Dr. McClelland in Records of the Government of India.*

PLAS-PAPARI-KA PHUL, also Tesu, also Kisu, DUK. Flowers of *Butea frondosa*.

PLASSEY was 80 miles north of Calcutta. A battle was here fought and won by Clive on the 23rd June 1757, with 700 European troops, 1,400 sepoys and 570 sailors and the victory threw Bengal, Behar and Orissa into British hands. Plassey was about sixteen miles higher up than Cutwa. But the memo-

PLATALEA LEUCORDIA.

able battle field has ceased to exist, changes in the bed of the river Ganges having swept it away. Of the famous mango-grove called the Lakha Bagh or the tope of a lac of trees, that was eight hundred yards long and three hundred broad, all the trees have died or been swept away by the river, excepting one, under which one of the nabob's generals who fell in the battle is buried. So long ago as 1801, there were no more than 3,000 trees remaining. The battle of Plassey may appear distinguished by no valorous deed or memorable exploit, but in the importance of its political or moral consequences, its name stands on the page of history as equal to those of Marathon, Cannae, Pharsalia, and Waterloo, the greatest battles in the annals of war. It is now a cultivated plain. The spot where the solitary tree yet survives, is called Pir-ka jaiga and is held sacred by the Mussulmans whose reasons are inexplicable indeed for so doing.—*Tr. of a Hind, Vol. i, pp 51, 53.*

PLATANACEÆ, the oriental plane tribe of plants, comprising one genus and four species, one of Europe and Asia Minor, one N. America, and two from Asia Minor and Central Asia. *P. orientalis*, the Oriental plane, has palmate leaves resembling those of the common *Sycamore*. It grows in the western parts of Asia, and extends as far east as Cashmere. Its wood is fine-grained and hard, and when old it acquires dark veins so as to resemble walnut-wood. The tree was valued for its shade by the Greeks and Romans, and it was held sacred in the east. *P. occidentalis* is found in most parts of North America, from Mexico as far as Canada. The timber is of a reddish-colour, and will not bear exposure to the weather. There is but this one genus in the order and six species. The family resembles *Artocarpacæ* and *Altingiaceæ*.—*Hogg; Eng. Cyc.*

PLATANISTA GANGETICA, Gray.

Dolphinus Shawensis Blainville, | *D. gangeticus*.

Platanista, of Pliny. Sou-sou, of India.
Dauphine du Gange, Z. Cur. Susa, of Buffon.

Inhabits the Indian seas, the Ganges, and Irawaddy.

PLATANUS ORIENTALIS Linn.

Doolh, AR. Chunar, HIND., PERS.
Oriental plane, ENG. Buna, Buin, Bonin, PANJ.
Chinar, HIND., PERS.

The Oriental plane is of giant size and great beauty. It is indigenous in most of the countries of the Levant; from whence it was transported in the first instance to Sicily. It is a native of Asia Minor, but extends into Cashmere. Some of the trees in the Turkish dominions, are of gigantic size, the ancients prized it particularly for the close shadow which its spreading foliage afforded, and they celebrated many of their festivities beneath its branches. The wood is hard and fine-grained much like that of the beech, but it is less hard, has a finer and closer-grain, and is more capable of receiving a good polish; it is, however, very apt to warp and split, is not durable, and is frequently attacked by the worm. Sinking the wood in water for several years, is said to improve its quality. It is used for gunstocks. According to Belon, the Greeks of Mount Athos were in the habit of making boats of a single piece, out of the trunks of the largest trees. It grows in Cashmere from seed, but requires to be transplanted. Some re-planted by Akbar in A. D. 1588, when seen by Mr. Vigne in 1838, were 20 feet in circumference. He had seen some grand trees in the valley opposite to Therapia

PLATAX ARTHRETIUS.

on the Bosphorus, and one near Avin, at the foot of the Elborz mountains, measured by Vigne, was 64 feet in circumference. It is admirably characterised by its derivative plata, ample, significant of its palmate leaves, its spreading branches, and shady foliage, the pale green-colour of which last contrasts beautifully with the silver bark of its lofty stem. Its value in a hot climate has been appreciated by those who looked no higher, to the beneficent goodness of the Creator, and in Kashmir the plane tree attained, under the fostering attention of royalty, to the greatest age and perfection. Dr. Stewart, however, says he has never seen this tree wild, and statements to the effect that it is indigenous in or near Kashmir (as by Hugel), probably as he thinks, arise from some confusion with Acer, owing to the resemblance of the leaves. It appears to be tolerably common planted in Afghanistan, and is frequently seen at villages, &c., in the Panjab Himalaya, extending sparingly east to the Beas, and up to 8,300 feet in Tibet. In the Kashmir valley it is abundant, the trees ranging up to 75 feet high, and he had noted seven or eight of about or more than 20 feet, the largest being 28 feet girth in Srinagar, Kashmir. The spread of two trees measured by him had a radius of 37 and 44 feet respectively in one direction. He had been told by a European officer of one seen by another officer near the Wular lake of 84 feet in girth, but this seems to him doubtful, and is possibly a corruption of Vigne's statement that he saw one of 66 feet girth under the Elburz near Teheran. The finest grove in Kashmir, or perhaps in the world, is the Nasim Bagh, on the banks of the lake, near the city of Srinagar, which at one time consisted of 1,200 noble trees said to be planted nearly 200 years ago. The tree is propagated by cuttings (and occasionally by seed in Kashmir.) To the eastward it does not thrive; The wood has a peculiar and rather handsome grain, but appears not to be strong and is not valued. Yet, in Cabul, where timber is scarce, Irvine states that it is the only material for gun-carriages, and in Kashmir it furnishes part of the wood for making the small painted boxes.—*Dr. Stewart, p. 202; Book of Trees, p. 152; Royle's Ill., p. 344; Ed. Baron Hugel's Travels in Kashmir and Punjab, p. 85; Cleghorn's Punjab Report.* See Chamba, Kangra, Kullu.

PLATA, Sp. Silver.

PLATAX ARTHRETIUS, *Cuv. and Val.*

Ecan bonna, Bell. | Chaetodon arthriticus, C. and V.

PLATYLOBIUM TRIANGULARE.

little isinglass to become of value.—*Cuv. and Val.* See Isinglass.

PLATE ARMOUR. The plate armour of Asia, unlike the complete steel cases of Europe, is formed of rectangular plates of steel, braced over the surcoat and covering only the vital parts. Underneath, however, a shirt of mail was generally worn. Much skill is lavished upon the plates which are of cast or damask'd steel, arabesqued in gold.—*Ben. As. Soc. Journ. No. 11 of 1854.*

PLATINUM or Platina,, Peh-kin, CHIN., from Plata, silver, an important metal, first made known in Europe by Mr. Wood, assay-master in Jamaica, who met with its ore in 1741. In 1750 he published a paper upon it in the 'Philosophical Transactions.' The name was given to it on account of its colour, it was originally called Platina del Pinto, because it was found in the auriferous sand of the river Pinto. It has since been found in Brazil, Colombo, St. Domingo, in the Ural mountains, but Dr. Mason asks on what authority Dr. Royle says that platina is found in Burmah. Captain Glover obtained a specimen from a priest in Tavoy, that resembled platina more than any other metal; and Dr. Mason had a specimen of a Tavoy mineral with the general aspect of platina, it was a mixed metal formed of silver, bismuth, zinc, and some other things to aid the alchemists in their search for "the philosopher's stone."—*Dr. Mason's Tenasserim.*

PLATO, the 'Platun of the Arabs and Persians, an eminent philosopher of Greece, born B.C. 429, son of Ariston and Perictione. His original name was Aristocles but he received the name of Plato from the breadth of his forehead and chest. Plato, Epicharmus, and others adopted a philosophy similar to that of the Vedanta, a system of perceptions of primary or secondary qualities. He died on his 82nd birthday, B.C. 348. He was a pupil of Socrates, the Bucrat of the Arabs, and had as a pupil Aristotle. See Kama, Vedas.

PLATYCERCUS HYPOPHONIUS, *G. R. Gray*, is called by the Malays "Kastori rajah," or prince parrot, from its being the most brilliantly plumaged of all that family. It is not large.

PLATYCERCUS VULNERATUS, of Timor, a green species of parrot?

PLATYCODON GRANDIFLORUM.

Kih-kang, CHIN. | Kih-hung, CHIN.

A plant of China of the Campanulacæ or Bellwort tribe. Its root is used by the Chinese medicinally.—*Smith.*

PLATYCORYNE BIFASCIATUS, one of the Coleoptera of Hong Kong.

PLATYLOBIUM TRIANGULARE, a free flowering shrub, with pretty flowers, readily

PLECTRANTHUS RUGOSUS.

grown from seed in any tolerable garden soil.
—*Riddell*.

PLATYONYCHUS BIPUSTULATUS. See *Portunidae*.

PLATYSTEMON CALIFORNICUM. *Ranunculaceae*. These are annuals with cream coloured flowers, natives of California, and said to grow best in sandy loam.—*Riddell*.

PLATYSTEMON MEGACEPHALUM. See *Chelonia*.

PLAVA. A name of the men of Butan.

PLATYCODON GRANDIFLORUM.

Kih-kang, CHIN. | Kih-hung, CHIN.

A plant of China, from the provinces of Se-chuen, Hupeh, Honan and Shan-si. It is said to be used to adulterate Gingeng.

PLAYFAIR. Several relatives of this name served as medical and military officers in the 19th century in the East India Company's Armies of Madras and Bengal. Dr. Lyon Playfair, C. B., an eminent chemist and philosopher of Great Britain, was at one time in Bengal. Lt.-Colonel Playfair wrote on the Fishes of Zanzibar.

PLECOTUS DARGILINGENSIS, *Hodg.*, syn. of *Plecotus auritus*, *Jerd*.

PLECOTUS HOMOCHROSIS, *Hodg.*, syn. of *Plecotus auritus*, *Jerd*.

PLECTOCOMIA, a genus of palms, growing in Malacca, Java, Assam and the Kassya Hills, with leaves of great length, having a hook at the end by which to support themselves. *Plectocomia* is the Rhenoul of the Lepchas and is not a very large plant: but it climbs lofty trees and extends 40 yards through the forest, 6,500 feet is the upper limit of the palms in the Sikkim, Himalaya, the Rhenoul alone attaining this height.—*Hooker*, Vol. i, p. 147; *Seeman*.

PLECTRANTHUS AROMATICUS, *Roxb.*

Coleus amboinicus, *Lour.*

Pen-bu, BURM. | Pathur-chur, HIND.
Fragrant plectranthus, ENG.
Cultivated in gardens at Ajmeer.—*Genl. Med. Top.*, p. 200.

PLECTRANTHUS ASPER, *Spreng.* also *P. barbatus*, *Andr.* in *Bot. Res.* *P. carnosus*, *Sims.*, and *P. crassifolius*, *Hart. Mal.* Syns. of *Coleus barbatus*, *Benth.*, and *Anisochilus carnosus*.

PLECTRANTHUS CORDIFOLIUS, a very aromatic plant of India of the order Labiatæ.—*O'Shaughnessy*, p. 491.

PLECTRANTHUS DUBIUS, *Spr.* *P. forskalii*, *Willd.*, and *P. monodelphus*, *Roxb.* Syns. of *Anisochilus carnosus*, *Wall.*

PLECTRANTHUS MONACHORUM, *Spr.* Syn. of *Ocimum sanctum*, *Linn.*

PLECTRANTHUS PARVIFLORA, *Willd.*

P. graveolens, *R. Br.*

A plant of N. Holland with blue or purple flowers.

PLECTRANTHUS RUGOSUS, *Rottler*, *Benth.*

PLECTOGNATHI.

Lumnitzera densiflora, *Sprenger*.
Isodon plectranthoides, *Schred.*

Picomar,	CHENAB.	Kot; Siringri; Itait, RAVI.

Sola; Solei,		Chichri; toarb,
Flea-killer,	ENG.	Sirru kalengu, TAM.
Bui,	JHEELUM.	Khwangero, TR.-INDUS.

A small, rather slender, shrubby plant, has a wholesome pleasant tasted, bulbous root, much eaten by the natives, particularly during the period of their great festivals. Its leaf is rough and not unlike that of Burrage, it grows in the Himalaya, at Mount Choor, Sirmoor, Dehra Dhoon and at Tinnevely. It is abundant in the Punjab Himalaya, from 3,000 to 9,000 feet, and occurs in the Salt Range. In places it is used as bedding to keep off fleas. The leaves have an aromatic sago-like smell and a somewhat bitterish taste.—*Ainslie*, p. 250; *Dr. J. L. Stewart*, M. D., *Punjab Plants*; *Voigt*, p. 449.

PLECTRANTHUS SECUNDUS, *Roxb.*

P. cordifolius, *D. Don.*, *P. incanus*, *Lam.*
Graham. *P. magpurensis*, *Retl.*
P. mollis, *Spreng.* *Ocimum molle*, *Ait.*
P. divaricatus, *Weinm.*

A plant of Mysore and the Western Dekhan, Kandalla, Roza, Ellora.

PLECTRANTHUS STROBILIFERUS, *Roxb.* Syn. of *Anisochilus carnosus*.

PLECTOGNATHI, an order of fishes which may be thus shown:

ORDER VI—PLECTOGNATHI.

FAM. I—*Sclerodermi*.

FIRST GROUP.—*Triacanthina*.

Triacanthodes anomalus, *Schleg.*, Japan.
Triacanthus brevirostris, *Schleg.*, E. Indies, China, Japan.

biaculeatus, *Bl.*, E. Indies, Australia.
strigilifer, *Cant.*, E. Archipelago, China.

SECOND GROUP.—*Balistina*.

Balistes, *Cuv.*

a Linurus.

B. stellatus, *Lacep.*, Indian and Pacific Oceans.

b Balistes.

maculatus, *Gm.*, Indian and Pacific Oceans, also Atlantic.

aureolus, *Rich.*, E. Indies.

vetula, Tropical Atlantic, E. Indies, Cape.

vidua, *Rich.*, E. Archipelago, Pacific.

capricornus, *Gm.*, Mediterranean, Pacific.

niger, *Mungo Park*, Indian Ocean, E. Archipelago.

mitis, *Benn.*, Indian and Pacific Oceans.

bursa, *Bl.*, *Schn.*, Indian and Pacific Oceans.

conspicillum, *Bl.*, *Schn.*, Sandwich islands.

viridescens, *Bl.*, *Schn.*, Indian Ocean, E. Archipelago.

ringens, *Leach*, W. Indies, Mauritius.

auromarginatus, *Benn.*, Mauritius.

rivulatus, *Rupp.*, Jedda.

fuscus, *Bl.*, *Schn.*, Indian Ocean, E. Archi-

flavimarginatus, *Rupp.*, Indian Ocean, Archi-

aculeatus, *Leach*, W. Africa to Pacific.

assasi, *Forsk.*, Red Sea.

verrucosus, *Leach*, Indian Ocean, Archipelago, New Ireland.

rectangulus, *Bl.*, *Schn.*, Indian Ocean, Archipelago, Polynesia.

PLECTOGNATHI.

cinereus, *Bonnat*, Mauritius.
undulatus, *Mungo Park*, Indian and Pacific Oceans.

oire, *Benn.*, Society Islands.

c Melanichthys.

buniva, *Lacep.*, Tropical Atlantic, Indian and Pacific Oceans.

d Erythrodon.

erythrodon, *Gthr.*, Indian Ocean, Archipelago.

jacksonianus, *Q. & G.*

heteracanthus, *Blkr.*

caprinus, *Val.*

lima, *Benn.*

monocanthus, *Cuv.*

a Monacanthus.

pardalis, *Rupp.*, Indian, Pacific and Atlantic Oceans.

scopas, *Cuv.*, Indian Ocean, E. Archipelago.

cryptodon, *Blkr.*, Celebes, Amboyna.

curtorhynchus, *Blkr.*, Amboyna.

prionurus, *Blkr.*, E. Archipelago, N. Guinea.

trossulus, *Rich.*, W. Australia.

oculatus, *Gthr.*, S. Australia.

baueri, *Rich.*, Australia.

chinensis, *Blkr.*, China, E. Archipelago.

megalurus, *Rich.*, Australian Seas.

tomentosus, *Leach*, E. I. Archipelago.

sulcatus, *Holl.*, E. I. Archipelago, Chinese and Australian Seas.

setifer, *Benn.*, E. Africa, Japan, China,

nematophorus, *Gthr.*, China, Borneo.

oblongus, *Schleg.*, Japan, Zanzibar.

chærocephalus, *Blkr.*, E. I. Archipelago.

nemurus, *Blkr.*, Java, Singapore.

melanocephalus, *Blkr.*, E. Archipelago.

spilosoma, *Benn.*, Sandwich Islands.

granulosus, *White*, N. S. Wales.

rudis, *Rich.*, Tasmania.

ayrandi, *Q. & G.*, Australia.

penicilligerus, *Cuv.*, E. Archipelago, Australia.

hippocrepis, *Q. & G.*, N. S. Wales.

knerii, *Steindachner*, China.

gunnii, *Gthr.*, Van Diemen's Land.

macrurus, *Blkr.*, E. Archipelago.

convexirostris, *Gthr.*, Tasmania, New Zealand.

multiradiatus, *Gthr.*, S. Australia.

trachylepis, *Gthr.*, Australia.

peronii, *Holl.*, S. Australia.

scaber, *Forst.*, N. Zealand.

brownii, *Rich.*, Australia.

spilomelanurus, *Q. & G.*, Australia.

b Aleuterus.

monoceros, *Osb.*, Atlantic, Tropical America,

Indian Ocean, E. Archipelago.

scriptus, *Osb.*, Zanzibar, Amboyna, Penang, Siam, W. Indies, Cape Verde.

liturosus, *Shaw*, Indian Seas, Otaheite.

personatus, *Less.*, N. Guinea.

nasicornis, *Schleg.*, Indian Ocean, E. Archipelago,

Japan.

pusillus, *Rupp.*

freycineti, *Cuv.*, *Holl.*

broceus, *Mitch.*

maculosus, *Rich.*

brevispinus, *Holl.*

platifrons, *Holl.*

serrasquamosus, *Holl.*

tricuspis, *Holl.*

dumerillii, *Holl.*

nitens, *Holl.*

trachyderma, *Blkr.*

holbrookii, *Holl.*

cuspidata, *Mitch.*

PLECTOGNATHI.

lineolatus, *Rich.*

anacanthus, *Gray.*

barbatus, *Gray.*

THIRD GROUP.—Ostraciontina.

Ostracion, *Art.*

a Ostracion.

gibbosus, *L.*, Indian Ocean, E. Archipelago.

concatenatus, *Bl.*, Cape of Good Hope, Chinese Seas, Australia.

cubicus, *L.*, Indian Ocean, E. Archipelago, Australia.

sebæ, *Blkr.*, Indian Ocean, E. Archipelago.

punctatus, *Bl.*, *Schn.*, Indian Ocean, E. Archipelago, Pacific.

renardi, *Blkr.*, Amboyna, Ceram, Java.

solorensis, *Blkr.*, E. Archipelago.

ornatus, *Holl.*, Marquesas.

nasus, *Bl.*, E. Archipelago, Pacific.

rhinorynchus, *Blkr.*, E. Archipelago, Australia.

diaphanus, *Bl.*, *Schn.*, Cape of Good Hope to Australia and Japan.

forasini, *Bianc.*, Indian Ocean, E. Archipelago.

cornutus, *L.*, Indian Ocean, E. Archipelago, Micronesia.

β Aracma.

aculeata, *Houttuyn*, Japan.

aurita, *Shaw*, Tasmania, S. Australia.

ornata, *Gray*, Tasmania, S. Australia.

lenticularis, *Rich.*, S. Australia.

ostracion boops, *Rich.*

FAM. II.—Gymnodontes.

FIRST GROUP.—Triodontina.

Triodon bursarius, *Reinw.*, Indian Ocean, E. Archipelago.

SECOND GROUP.—Tetrodontina.

Xenopterus naritus, *Rich.*, Penang, Sumatra, Borneo.

modestus, *Blkr.*, Sumatra, Borneo.

tetrodon, *L.*

β Gastrophysus.

lagocephalus, *L.*, English, Irish and E. African Coasts.

lævigatus, *L.*, Japan, Tropical America.

lunaris, *Bl.*, *Schn.*, E. Archipelago, Indian Ocean, Pacific, Brazil.

sceleratus, *Forst.*, Indian Ocean, E. Archipelago.

honckenii, *Bl.*, Cape of Good Hope to China.

hypselogenion, *Blkr.*, E. Africa to Australia.

oblongus, *Bl.*, Indian Ocean, China, Japan, S. Sea.

ocellatus, *Osb.*, China.

rubripes, *Schleg.*, China, Japan.

hamiltonii, *Rich.*, Port Jackson.

vermicularis, *Schleg.*, Japan.

pardalis, *Schleg.*, Japan.

γ Cheilichthys.

richei, *Freminv.*, S. Australia, N. Zealand.

multistriatus, *Rich.*, S. Polynesia.

δ Liosaccus.

cutaneus, *Gthr.*, St. Helena, Cape of Good Hope.

porphyreus, *Schleg.*, Japan.

angusticeps, *Jen.*, Galapagos.

ε Crayracion.

palembangensis, *Blkr.*, Siam, Sumatra, Borneo.

liurus, *Blkr.*, Java, Sumatra, Borneo.

ζ Chelonodon.

patoca, *H. B.*, Coasts of E. Indies.

viridipunctatus, *Day*, Cochinchina.

waandersii, *Blkr.*, Bombay.

η Monotretus.

cutcutia, *H. B.*, Ganges.

θ Arothron.

immaculatus, *Bl.*, *Schn.*, Red Sea, Australia, Polynesia.

carduus, *Cant.*, Penang.

PLEURONECTIDÆ

PLOCARIA CANDIDA.

- cochinensis, *Day*, Malabar.
 nigropunctatus, *Bl.*, *Schn.*, Indian Ocean, E. Archipelago, Fiji.
 diadematus, *Rupp.*, Red Sea.
 mappa, *Less.*, Indian Ocean, E. Archipelago.
 stellatus, *Bl.*, *Schn.*, Indian Ocean, E. Archipelago, Pacific.
 reticularis, *Bl.*, *Schn.*, Indian Ocean, E. Archipelago.
 hispidus, *Lacep.*, Red Sea, E. Africa, Ceylon.
 bondarus, *Cant.*, Vizagapatam, Penang.
 erythrotænia, *Blko.*, Celebes, Amboyna.
 meleagria, *Lacep.*, Polynesia.
 firmamentum, *Schleg.*, Japan.
 fluviatilis, *H. B.*, Fresh waters of East Indies.
Anomimus.
 margaritatus, *Rupp.*, E. Africa, Tahiti.
 papua, *Blkr.*, E. Archipelago.
 bennetti, *Blkr.*, E. Archipelago, Indian Ocean.
 janthinopterus, *Blkr.*, Celebes, Amboyna.
 amboinensis, *Blkr.*, Indian Ocean, E. Archipelago.
 sanctæ helenæ, *Gthr.*, St. Helena, Japan.
 striolatus, *Q. & G.*, E. Archipelago.
 rivulatus, *Schleg.*, Japan.
 valentini, *Blkr.*, Indian Ocean, Archipelago.
 grammatocephalus, *Schl.*
 cochinchinensis, *Steind.*
 Diodon hystrix, *L.*, Tropical Atlantic, Indian Ocean, Pacific, E. Archipelago.
 spinosissimus, *Cuv.*, Cape of Good Hope, Siam.
 maculatus, *Gthr.*, Tropical Atlantic, Cape of Good Hope, E. Archipelago, Pacific.
 bocagei, *Steindachner*, Port Jackson.
 Chilomycterus calarii, *Bianc.*, Zanzibar.
 orbicularis, *Bl.*, Indian Ocean, E. Archipelago.
 echinatus, *Gronov.*, Cape of Good Hope.
 jaculiferus, *Cuv.*, N. Zealand.
 tigrinus, *Cuv.*, Indian Seas.
 Dicotylichthys punctulatus, *Kaup.*, Australia, Cape of Good Hope.
 Atopomycterus nychthemerus, *Cuv.*, Australia.
 THIRD GROUP. — *Molina.*
 Orthogoriscus, *Gray*, E. I. Fishes
 lanceolatus, *Lienard*, Mauritius.
 truncatus, *Retz.*, Atlantic, Pacific.

PLEMBANG, or Palembang, a port and town on the coast of Sumatra. See Banca Islands, Johore.

PLEUROBRANCHIDÆ, a family of Molluscs, viz :

- Pleurobranchus, *Syn. Berthella*. *Oscanius*, rec. 20 sp.
Sub-genus. ? *Pleurobranchus*. rec.
 Posterobranchia. rec.
 Runcina. *Syn. Pelta*. rec.
 Umbrella. Chinese-umbrella shell. *Syn. Acardo*. *Gastrophax*, rec. 3 sp. fossil, 2 sp.
 Tyrodina. rec. 3 sp.

PLEURONECTIDÆ, a family of fishes which may be thus shown :

FAM. 7. — Pleuronectidæ.

- 1 Psettodes, 2 Hippoglossus, 2 Hippoglossoides, 1 Tephritis, 7 Rhombus, 1 Phrynorhombus, 6 Arnoglossus, 1 Citharus, 1 Brachypleura, 1 Samaris, 1 Psettichthys, 2 Citharichthys, 3 Homirhombus, 14 Pseudorhombus, 1 Paralichthys, 13 Rhomboidichthys, 22 Pleuronectes, 5 Parophrys, 1 Psammodiscus, 1 Ammotretis, 3 Rhombosolea, 1 Peltorhamphus, 34 Solea, 2 Pardachirus, 1 Liachirus, 9 Synaptura, 1 Æsopia, 2 Gymnachirus, 1 Soleotalpa, 1 Apionichthus, 1 Ammopleirops, 1 Aphoristia, 3 Plagusia.
 20 Cynoglossus.

PLEURONECTES SOLEA. The sole.

Kowlie mutchie, DUK. Naak meen, TAM.
 Ecan leda, MALAY.

— *Ains. Mat. Med.*, p. 155.

PLEUROPTERA, a tribe of Mammals, generally known as the flying lemurs, flying cats, and flying foxes. See Mammals.

PLEWAN, Pseru, or Plewane, HIND. Salvadora oleoides.

PLEUROTOMA, a genus of Molluscs.

PLICATULA, a genus of Molluscs.

PLINY, a historian of Rome, whose name was Caius Plinius Secundus, born A. D. 23. He died A. D. 79, suffocated by a pestilential vapour near Mt. Vesuvius. He was a voluminous author, but most of his works have been lost, the Historia naturalis, or Historia mundi still remains, it is in 37 books. Notices occur in it of Khuzistan, Koli, Lokman, Okelis and the Kol race.

PLOCARIA, a genus of plants belonging to the alliance Algae, the order Ceramiales, and the sub-order Sphærococceæ. One of the species, P. helminthocorton, a native of the Mediterranean is called Corsican moss, and has a considerable reputation as a vermifuge.

— *Eng. Cyc.*

PLOCARIA CANDIDA, *Nees*.

Gracillaria lichenoides, *Greville*. | Fucus amylaceus.
 Kyouk-pwen, BURM. | Sea weed, ENG.
 Hai-tsai; Hai-tsau, CHIN. | Agar-agar, MALAY.

The Chinese name Hai-t'sai means sea vegetable, and is applied to all the different kinds of Algae used as articles of diet. The Malay term Agar-Agar is also applied by the Malay race to the Gigartina tenax and Sphærococcus growing on the rocky shores of Malaysia. The Plocariacandida sea weed is abundant on the Tenasserim coast, and exceedingly valuable for its nutritious and medicinal properties for invalids. It was first brought to public notice by Dr. O'Shaughnessy as the Edible moss of the Eastern Archipelago, and referred by him to the genus fucus. The fructifications, however, being in small tubercles, the Rev. Mr. Mason considers it as a species of Agardh's genus, Sphærococcus which now constitutes a member of the genus P. Focaria. It is an allied species with the Ceylon moss (Gigartina lichenoides) first described as fucus amylaceus by Dr. O'Shaughnessy, the P. Focaria lichenoides of Mr. Mason; also with a species found on the coast of Devonshire in England; Pl. compressa: with the Corsican moss of the Mediterranean, P. Helminthocorton; also with the Agar-agar Pl. tenax a species used in China, as a substitute for glue and gum arabic, but differs from the Irish moss or Chondrus crispus; and is not of the same natural family as the Iceland moss which, indeed, is a lichen, the Cetraria islandica. The Tenasserim moss is said to be

superior to all others, as it is wholly free from the bitter principle which renders other fuci so objectionable ; but Mr. Mason seems to consider it identical with the Ceylon moss, for he gives the same account of it as Dr. O'Shaughnessy gives of that from Ceylon. It contains he says a considerable proportion of starch, and was hence named by Dr. O'Shaughnessy, the starch fucus, *F. amilaceus* but its specific name has been since changed to *candida*, white, probably from a mistaken idea that the substance is naturally white, whereas it becomes so only by bleaching in the sun ; its natural tint, is a shade between olive and purple, such as the natives designate red. According to Dr. O'Shaughnessy's analysis it contains in 100 parts as follows :

Vegetable jelly, ...	54.5	Sulphate & muriate of	
True starch,	15.0	soda,	6.5
Wax, a trace, ...	0.5?	Sulphate & phosphate	
Ligneous fibre, ...	18.0	of lime,	1.0
Gum,	4.0	Iron, a trace,	0.4?

On the best mode of preparing it for use he adds : " In the first place, from the tendency of pectin or vegetable jelly to form insoluble compounds with saline and earthy bases, it is necessary to steep this fucus for a few hours in cold rain water as the first step in its preparation. This removes a large portion, if not the entire, of the sulphate of soda, leaving all the gelatine, and starch. It should next be dried by the sun's rays, and ground to a fine powder ; cutting or pounding, however, diligently or minutely performed, still leaves the amylaceous globules so mechanically protected, and so closely involved in an external sheath of tough ligneous fibre, that scarcely a particle of the starch can be extracted by boiling, even though the decoction is prolonged for several hours. When ground, boiling for 25 minutes or half an hour dissolves all the starch and gelatine. The solution while hot should be passed through muslin or calico, and thus the ligneous fibre is removed : lastly, the strained fluid should be boiled down till a drop placed on a cold surface gelatinizes sufficiently. With milk and sugar, and flavoured with lemon juice or sherry, this substance when prepared as now directed, would afford the invalid a pleasant article of diet, especially at sea, where other jellies or their materials cannot be so easily preserved. As this fucus is found abundantly on the eastern coast of Bengal, Mr. Mason entertained considerable hopes of its being hereafter found available also in several processes of art and various manufactures.—*O'Shaughnessy ; Mason's Tenasserim*. See Edible sea-weed.

PLOCARIA COMPRESSA, Pl. Helminthochorton and Pl. Lichenoides, see Edible sea-weed.

PLOCEINÆ, the weaver birds, a sub-family

of birds of the family *Fringillidæ* and tribe *Curvirostræ*. The weaver birds form curious pensile nests.

Ploceus baya, *Blyth*, the common weaver bird, Ceylon, all India, Assam, Burmah.

P. manyar, *Horsfield*, the striated weaver bird, Burmah and Archipelago.

P. bengalensis, *Linna*, black throated weaver bird, British India, Assam, Tipperah, Burmah.

P. philippinus—? Java, Burmah.

They build nests like a crucible, with the opening downwards and usually attach them to the tender branches of a tree hanging over a well or tank.

PLOCREDERMA, see *Laudakia melanura*.

PLOHIERRO, Sp. Iron wood.

PLOMB, Fr. Lead.

PLOMBAGO, Black lead, see *Plumbago*.

PLOMB-DE-MINE, or *Potelot*, Fr. Black-lead.

PLOMB SULFURE, Fr. Galena.

PLOM CARBONATE, Fr. White lead.

PLOMO, Sp. Lead.

PLOTOSUS ANGUILLARIA, and *Pl. albilabris* occur in the seas of the Malay peninsula. At Pinang, the latter species is less numerous, both are eaten by the poorer classes of natives. The wounds of both are equally dreaded.

PLOTOSUS CANIUS, *Buch. Ham., Cal. Cat.*

Notopterus pallasii, *Cuv. et Val., Cal. Cat.*

PLOTUS LEVAILLANTII, see *Pelecanus*.

PLOUGHING. Amongst the hindoo races of British India, at the close of the ploughing and sowing season, either in the spring or autumn, the plough is worshipped. It is the *Har-puja*. The Chinese annual ceremony of ploughing is of very ancient origin. At Peking it consists in ploughing a sacred field with a highly ornamental plough kept for the purpose, the emperor holding it while turning over three furrows, the princes five, and the high ministers nine. These furrows were, however, so short that the monarchs of the present dynasty altered the ancient rule, ploughing four furrows and returning again over the ground. The ceremony finished, the emperor and his ministers repair to the terrace, and remain till the whole field has been ploughed. The ground belongs to the temples of heaven and earth, on the south of the city, and the crop of wheat is used in idolatrous services. The rank of the actors renders the ceremony more imposing at Peking, and the people of the capital make more of it than they do in the provinces. A monstrous clay image of a cow is carried to the spot, containing or accompanied by hundreds of little similar images ; after the field is ploughed it is broken up, and the pieces and small images are carried off by the crowd to scatter the powder on their own fields, in the hope of thereby insuring a good crop. The heads of the provincial governments, the pre-

fects and district magistrates, go through a similar ceremony on the same day. In Ningpo, an eye-witness describes the principal features of the ceremony as consisting in a solemn worship, by all the local officers, of a clay image of a buffalo and an idol of a cowherd. The prefect then ploughed a small piece of ground, and he and his associates dispersed till the morrow, when they came together in another temple at dawn. Here a series of prostrations and recitals of prayers were performed by the "fathers of the people" in their presence, some of whom seemed to have no respect for the worship they were engaged in, while others evinced deep reverence. As soon as this was over, the clay ox was brought out, and a procession consisting of all the officers passed around it repeatedly, striking the body at a given signal, and concluding the ceremony by a heavy blow on the head. The crowd then rushed in and tore the effigy to pieces, each one carrying off a portion to strew on his fields. In British India, the plough is more usually drawn by the buffalo but often by bullocks and from two to eight team are put to the plough according to the nature of the land. In the Malay countries the plough is usually drawn by one or two buffaloes, which, peculiarly adapted for the wet land culture of rice, to which the use of the plough is almost exclusively confined, the chunkal or large hoe, being the instrument employed in turning up the soil in plantation culture.—*Wils. Gloss.*; *Williams' Middle Kingdom*, Vol. ii, p. 109.

PLOVER, a name applied in ordinary conversation to species of birds, of the families Cursoridæ and Charadriidæ;

Cursorinae.

Cursorius coromandelicus, *Gm.* Indian courier plover.
Rhinoptilus bitorquatus, *Jerd.* Double-banded "
Glaucala orientalis, *Leach.* Large swallow "
G. lactea, *Temm.* Small swallow plover.

Charadrine.

Squatarola helvetica, *Gm.* Grey plover.
Charadrius longipes, *Temm.* Golden plover.
Ægialitis Geoffroyi, *Wagler.* Large sand plover.
Æ. pyrrhorostris, *Temm.* Small "
Æ. cantianus, *Latham.* Kentish ring plover.
Æ. philippensis, *Scopoli.* Indian ringed plover.
Æ. minutus, *Pallas.* Lesser ringed plover.

The courier plover runs about rapidly, nodding its head occasionally when it stops, running for a distance at speed, suddenly stopping, erecting the body and then starting off again. The large and small swallow plovers hawk over the fields of grain or runnals of grass, catching insects in the air.—*Jerdon.*

PLOWDEN, Mr., once Her Britannic Majesty's Consul in Abyssinia, who, in 1860, died from wounds received in an attack made upon him by one of the chiefs in Tigre, while he was travelling through that province from Gonda to Massowa.

PLUKENET. Leonard Plukenet's works

were published in London between 1696 and 1705, in 4 volumes quarto, containing 454 plates, with 2,740 figures of plants, many of them Indian. These figures are small, and often much reduced from the natural size, especially when the plants were large, but are generally very characteristic: they are much less costly and more easily procured than those of Rheede.

PLUMS.

Kia-king-tsze, CHIN. | Nai, CHIN.
The fruit of the tree, *Prunus domestica*, indigenous to the greater part of the northern hemisphere, 274 varieties of this fruit are enumerated. Dried plums form an article of commerce under the names of prunes and prunellas.—*Smith's Materia Medica*; *Faukner*. See Kabul.

PLUMAZO DE AVESTRUX, Sp. Estrich, Estridge.

PLUM-OIL, Oil of kernel of *Prunus domestica*.

PLUIMEN, Dut. Feathers.

PLUMAS, Sp. Feathers.

PLUMBAGO.

Black lead. | Plumbago.
Carburet of iron. | Graphite.

Plumbago is a carburet of iron though commonly known as blacklead, and also called graphite. It is used for making leads for pencils and crucibles. Veins of this occur in the hills near Nambrapane. These are largely worked in Ceylon, and 2,000 tons are annually exported.

Plumbago is sold for antimony in the bazaars, it is found in Ceylon and Travancore, also in Kumaon, and the Northern Circar mountains and abounds in the hills skirting the western boundary of the Vizagapatam district. The deposits have never been worked, and that which is brought to the coast is coarse and impure. A fine and varied series, both as regards size and quality were exhibited by General Cullen from Trevandrum. One large block was in a matrix along with laterite and contained some pieces the size of a walnut, nearly equal to the fine kinds of Cumberland black lead. Other large blocks nearly a foot in cubic measurement appear of a softer and coarser quality, not so compact as the brightest portions of the first-named block. This plumbago or graphite is well suited for the manufacture of ordinary pencils or for making crucibles. Lieut. Evans, 51st Regiment M. N. I., exhibited plumbago of good quality from Ceylon, and of indifferent quality from beds of shale that accompany iron ore at Malacca. Some indifferent specimens of plumbago were also exhibited along with iron ore and slaty shales

from Cuddapah. This mineral was formerly found in its most pure state in Borrowdale in Cumberland, which indeed was the only mine that produced lead of that fine quality requisite for the manufacture of drawing pencils. The Cumberland mines have been wrought since Elizabeth's time; pure Cumberland lead costing as much as from 30 to 40 shillings a pound. The lead is not found in veins but in detached pieces, so that the supply is occasionally irregular and the search for it laborious and often fruitless. Inferior descriptions of lead come from Spain and Ceylon, and are used in the manufacture of crucibles and of the inferior sort of pencils and in polishing cast iron. Finely powdered graphite can, by an extreme degree of pressure, be rendered nearly as compact as the best natural graphite, or we should be without any more good drawing pencils. The great manufacturers of pencils in England reported the Kumaon and Travancore specimens as quite useless for the manufacture of black lead pencils, observing that they could not use the specimens in the state in which they had been sent without damaging their machinery, at the same time they could not conceive why purer specimens should not be found in the same locality. In regard to the objections made to the specimens forwarded, General Cullen, Resident of Travancore, reports on the plumbago or graphite of Travancore, that two varieties are found one in thin laminae, another granular, and he sent specimens of both to the Exhibition of 1851. The granular or fibrous variety, he had discovered in two localities and both of them in laterite, a few feet only below the surface. One locality is about 5 or 6 miles N. E. of Trevandrum and the other about 12 or 14 miles N. E., he brought in from this latter locality on his visit to it, about 3 cwt. Some small deposits are also found immediately on the W. of the town of Trevandrum. Graphite in thin scales or laminae is common nearly throughout the laterite tracts of Travancore and Cochin, but more or less abundant in particular places. It is found in some places in laminae of considerable size, particularly in a laterite hill about 25 miles N. E. of Trevandrum at a place called Caviattencudul, near the foot of the ghat mountains. It is also found in laminae of good size in the disintegrated gneiss of the ghats on the Tinnevely side, also common in the Kunkur or Travertine deposits near Cuddacoorche and Amba-samoodrum. The Vizagapatam graphite is perhaps also found in laterite, of which there is a large deposit at Bimlipatam. Plumbago mixed with boiled oil, and applied to canvas and other cloths, renders it non-combustible. A powdery plumbago has been obtained from Jammu territory, and a specimen of rather bet-

ter stuff found in some other parts of the Gurgaon hills. Dr. W. J. Thomson says that the most eastern point of the hill at Sonah is semi-detached from the principal range by a deep gorge. This portion is composed of sandstone much indurated by heat and mixed with eruptive quartzose and gneiss rock near the top. About half way up (100 feet) on the eastern slope of the gorge, where it is nearly precipitous, he found a bed of a soft black stone, easily friable, and soiling the fingers when touched, and brought home some specimens. The bed was from 18 to 24 inches thick, and, as far as traced, it extended about 30 yards N. and S., and had a dip of nearly 10 to the N, he conjectured that plumbago of an equally pure quality and more dense structure will be found further in. A plumbago mine, was discovered by Dr. W. J. Thornton, Civil Assistant Surgeon, Gurgaon, in October 1861. It is found in masses of variable sizes, and in general quite detached; though, in some cases, the rock all round is full of plumbago mixed with finely divided micaceous particles, it was sent to the Exhibition of 1862, from Malacca, Burmah, Vizagapatam, Umritsur, Darjeeling.—*Cat. Ex. 1862; Observations on the graphite or plumbago of Kumaon and Travancore by Dr. Forbes Royle, M. D., with an extract from a letter from the Resident of Travancore and Cochin, dated 9th February 1857; Bombay Gazette; M. L. S. Journal; Rohde's MSS.; M. C. C.; M. E. J. R.; Genl. Cullen; Simmond's Dict.*

PLUMBAGO CAPENSIS, flower.

PLUMBAGO EUROPEA.

Chitra vani,

SANS. Chitra; Chitah; Shitraj.
SANS.

An erect, branching, smooth, herbaceous shrub. The whole plant, especially the root, is very acrid, and, applied as paste to the skin, acts as a powerful vesicatory. Given internally in small doses, it is said to be a very efficacious emetic, but we would deem its administration as dangerous as that of cantharides. The bruised root has been employed in Europe as an application to cancer, as a counter-irritant in toothache, and as a remedy for the itch. It is a native of various parts of the East Indies, is nearly similar to the Chittramoolum in its natural qualities. The bruised root tempered with a portion of some bland oil, is used as an external application in rheumatic and paralytic affections. It is also prescribed internally in powder, in small doses, for the same complaints. The properties of this species and of the *P. scandens* and *P. zeylanica* are nearly identical. A paste made with rice congee and the bruised bark is applied by the natives to buboes in the incipient states: it acts as a vesicatory. Dr. O'Shaughnessy made numerous clinical experiments with the bark of the plumbago root of

various species, especially the *P. rosea*, rubbed into a paste with water and a little flour, or congie; it occasions pain in about five minutes, which increases in severity till a quarter of an hour it is equal to that of a cantharides blister or mustard sinapism. If the paste be removed in half an hour the pain is soon allayed, and in a period of 11 to 18 hours a large uniform blister, full of serum, is occasioned. The blistered surface heals readily without unpleasant ulceration.

PLUMBAGO ROSEA, *Linn.* Applying *Plumbago rosea* in the native of India, the skin in a few minutes is intensely blackened; in white-skinned persons a deep redness is occasioned. In all chronic cases and in many acute diseases this blister will prove an effectual and very cheap substitute for cantharides, over which it possesses the peculiar advantage of never producing strangury or any other form of irritation of the urinary organs. Dr. O'Shaughnessy speaks from the experience of from 3 to 400 cases. His experiments led him to believe that the blistering quality resides in the plumbagin, but on this point he was unable to speak in positive terms. The root, in various forms, is much employed as a poison in India; and as an irritant to occasion abortion it is introduced into the vagina and applied directly to the neck of the uterus. In a criminal case of the former kind, in 1837, Dr. O'Shaughnessy, succeeded in detecting the poison by acting on the contents of the stomach with alcohol, concentrating the tincture, redissolving in a small quantity of boiling water, and adding the sub-acetate of lead, by which the very characteristic red colour was immediately occasioned. By a modification of this process two grains of the powdered bark may be detected in a pint of a mixture of milk, blood, and various articles of food. A powerful irritant, containing a neutral crystalline principle of plumbagine.—*O'Shaughnessy*, pp. 508-10; *Ainslie's Mat. Med.*, p. 112; *Powell's Handbook*, Vol. i, p. 368.

The White *Plumbago* is common; so are the other varieties, red and blue, and blossom throughout the year; but the blue is the handsomest of the whole, and introduced from the Cape, is by far the most esteemed. Is propagated by layers. The three different species of *plumbago*, the red, the white, and the blue flowered, are common in Tenasserim gardens; and the first two are cultivated by the Burmese

for the vesicatory power of their roots.—*Riddell*; *Mason*.

PLUTARCH, a Roman, who mentions the Bulla, as suspended from the necks of the more noble Roman boys, as a phylactery, or "preservative of good order, and as it were a bridle on incontinence." But it is not improbable that some of the Jews in our Saviour's time, as they certainly did afterwards, regarded their phylacteries as amulets or charms, which would keep or preserve them from evil. There is a remarkable passage in a rabbinical Targum, written about 500 years after Christ, which may both serve to illustrate what our Lord says, Matt. xxiii, 5, and to show what was the notion of the more modern Jews concerning their phylacteries. It runs thus:—"The congregation of Israel hath said, 'I am chosen above all people, because I bind the phylacteries on my left hand and on my head, and the scroll is fixed on the right side of my door, the third part of which is opposite to my bed-chamber, that the evil spirits may not have power to hurt me.'" See Parkhurst's Greek Lexicon; also Bishop Patrick, and Calmet, quoted by D'Oyly and Mant, in a note on the passage in St. Matthew.—*Ras Mala, Hindoo Annals*, Vol. ii, p. 409. See Yavana.

The genus *Poa* has its glumes rather unequal; the outer palea with 3 or 5 nerves, membranous below, scarious at the tip, compressed, keeled, unarmed; the styles terminal. The species of this genus are very numerous, constituting the commonest weed that follow the migrations of man, and generally containing a sufficient quantity of nutritive matter to render them fodder for various animals. Thirteen species of this genus are described by Babington as natives of the British Islands. Of these the most common are the *P. annua* and *P. pratensis*. The former is perhaps the commonest of British plants, springing up on every neglected spot around the habitations of man. The latter is known by the name of the Smooth-stalked Meadow-grass, and is found in most pasture lands. *P. nemoralis*, the Wood meadow-grass, is also a common grass in shady places. Many of the recent genera of grasses were formerly referred to the genus *Poa*.—*Voigt Hort. Sub. Cal.*

Darbha,	" TEL.		

A plant of Egypt and India, the sacred grass of the hindoo, the dab or koosha of the brahmins and sacred to Siva; as are also the pepul, banyan, the neem (*Melia azaderachta*), the *Cratæva religiosa*. The *Ocimum sanctum* or tulsi is sacred to Vishnu and Krishna. Some hindoo legends make Garuda the offspring of Kasyapa and Diti. This all-prolific dame laid an egg, which it was predicted would produce her a deliverer from some great affliction: after a lapse of five hundred years, Garuda sprung from the egg, flew to the abode of Indra, extinguished the fire that

surrounded it, conquered its guards, the devata, and bore off the amrita (ambrosia), which enabled him to liberate his captive mother. A few drops of this immortal beverage falling on the kusa, it became eternally consecrated; and the serpents greedily licking it up, so lacerated their tongues with the sharp grass, that they have ever since remained forked; but the boon of eternity was ensured to them by their thus partaking of the immortal fluid. This cause of snakes having forked tongues is still in the popular tales of India, attributed to the above greediness; and their supposed immortality may have originated in some such stories as these; a small portion of amrita as in the case of Rahu, would ensure them this boon. See Dharmarajah, Dab, Doob, Garuda, Hindoo, Yama.

POALUM, MALAY. Coral.

POALKAYA, TEL. *Trichosanthes anguina*, Linn.

POAM or Boa or Boe, a Malabar and Canara wood much like the timber called in Ceylon Palari, or Pali, and Irambu, or, as known by the English name, iron-wood. It is a strong, heavy wood, and is considered durable. It grows from 20 to 30 feet high, and from twelve to thirty inches in diameter.—*Edye, Forests of Malabar and Canara.*

POCHAN, of Dera Ghazi Khan, a woman's scarf.

POCHIOBORO, URIA? A tree of Ganjam and Gumsur. Extreme height 30 feet, circumference $2\frac{1}{2}$ feet, and height from the ground to the intersection of the first branch, 6 feet. Tolerably common, only used for firewood and charcoal.—*Captain Macdonald.*

POCKHALN, GER. *Guaiacum officinale*.

POCOCK, EDWARD, author of History of the Arabs.

POCREE of Delhi, Cotton-gatherer.

PODADENIA SAPIDA, Thw.

Rottlera thwaitesii. | *Stylanthus thwaitesii*, Baillon.

A large tree of Ambagamowa in Ceylon and at Marai-Calai, near Ratnapoora, at an elevation of 1,000 to 2,000 feet.—*Thw. En. Pl. Zeyl.*, p. 274.

PODAK, TEL., Female, *Eudynamis orientalis*, Linn.

PODALA MANU, TEL. *Acacia catechu*, Willd.

PODA PATRA, TEL. *Gymnema sylvestre*, R. Br.—also *Asclepias geminata*, R. ii, 45. The Konda Doralu call it Putla podara, Br. gives the meaning *Tylophora vomitoria* on the authority of Ainslie.

PODALYRIA GENISTOIDES, a pretty shrub with silky leaves, should be grown in a light garden soil, their colours are mostly white, purple, blue or red, and should be raised from seed. See Leguminosa.

PODOCARPUS MACROPHYLLUS.

PODI-URILANGA, SINGH. *Trichosanthes anguina*, Linn.

PODOCARPUS, a genus of the yew tribe of plants, the *Taxaceæ*, of which the following E. I. species are known :

polystachys, R. Br. Nepal, Khassya, Malacca, Singapore, China, Japan.

elongatus, *Herit.* — ?

chinensis, Swt., China.

cupressinus, R. Br. Penang, Java.

macrophylla, Wall. Maki, S. & Z. *Chinensis*, Wall. JAP.

koraiana, Sieb. JAP.

nageia, R. Br. "

japonica, Sieb. "

cuspidata, Endl. "

grandifolia, Endl. "

PODOCARPUS DACRYDIODES is the Kahikatea or white pine timber tree of New Zealand.

PODOCARPUS FERRUGINEA is the Miro timber tree of New Zealand.

PODOCARPUS LATIFOLIA occurs in the mountains of Sylhet.

PODOCARPUS MACROPHYLLUS in Nepal, Penang, Amboyna and Japan.

PODOSTEMON.

PODOCARPUS NERIIFOLIA — ?

Theet-min, BURM.

The meaning of this Burmese name is 'the prince of trees.' These are large trees with stems not very regularly shaped, and found on the higher hills between Sitang and Salween rivers, and on the range which skirts the coast of the Tenasserim provinces in British Burmah. The wood is close-grained and may prove a substitute for box-wood. A cubic foot weighs lbs. 50. In a full grown tree on good soil the average length of the trunk to the first branch is 20 feet and average girth measured at 6 feet from the ground is 6 feet. — *Dr. Brandis' Cal. Cat. Ex. 1862; Royle's Ill. Him. Bot., p. 349.*

PODOCARPUS SPICATA, is the Matai or Mai or Blackpine timber tree of New Zealand.

PODOCARPUS TOTARA, is the Totara or Mahogany pine, a timber tree of New Zealand.

PODODAPHNE, Gr. *Nerium oleander*.

PODOLEPIS GRACILIS. The stems of these plants are covered with scales, the flowers are white, yellow and pink, the plants are adapted for borders, and may be raised from seed. — *Riddell.*

PODOPHYLLUM VIGIL, Edw. Indian Ocean.

PODOPHYLLUM EMODI, Wall. Occurs in Nepal and Kumaon, and on the Choor mountain in the Himalayas, at an elevation of 10,000 feet. A specimen of the root was forwarded to the Committee investigating the Bengal drugs, by Dr. Falconer, of Seharunpore, but the quantity obtained was too small for the requisite experiments being instituted upon its virtues. — *O'Shaughnessy, p. 170.*

PODOPHYLLUM HEXANDRUM, was found by Dr. Royle on the Kedarkanta mountain, at an elevation of 12,000 feet. — *O'Shaughnessy, p. 170.*

PODOPHYLLUM PELTATUM, the May-apple, is a native of the United States, where the root is considered to be a valuable, and powerful cathartic. — *O'Shaughnessy, p. 170.*

PODOSTEMON. Of this genus of plants, Dr. Wight, in *Icones*, gives, *P. dichotomus*, *elongatus*, *griseus*, *olivaceus*, *rigidus*, *subulatus*, *Wallichii*, *Wightii*, *P. Wallichii*, *R. Br.*, *P. Griffithii*, *Wall.*, have been found on the Khasia mountains. One species grew near the Jyntea hills on the stones at the bottom of the Oongkot : it is a remarkable water-plant resembling a liver-wort in its mode of growth. Several species occur at different elevations in the Khasia, and appear only in autumn, when they often carpet the bottom of the streams with green. In spring and summer no traces of them are seen ; and it is difficult to conceive what becomes of the seeds in the interval, and how these, which are well-known, and have

no apparent provision for the purpose, attach themselves to the smooth rocks at the bottom of the torrents. All the kinds flower and ripen their seeds under water, the stamens and pistil being protected by the closed flower from the wet. This genus does not inhabit the Sikkim rivers, probably owing to the great changes of temperature to which these are subject.—*Hooker's Him. Journ.*, Vol. ii, p. 314; *W. Ic.*

PODOTHECA CAPITATA, a yellow flowering plant of no great beauty, readily cultivated from seed.—*Riddell*.

PODSWESCHNIKII, *Rus.* Candlesticks,
PODU-TALLI, *Tam.* *Zapania nodiflora*, *L.*
PCEATSJETTI, *Malhal.* *Gomphia angustifolia*.

POEE, *Tam.* *Basella alba* and *B. rubra*, Malabar nightshade, a twining, succulent plant, with smooth fleshy leaves; it grows very rapidly and is generally cultivated as a spinach. There are two sorts.—*Jeffrey*.

POECHANIDIA, *Uria*. *Elæocarpus*, species.

POEPHAGUS GRUNNIENS, the Yak.

POETRY. The poetry of the hindoos is rich, high and varied, abounding in luxuriant descriptions and occasionally displaying both grandeur and tenderness; but it is often rendered dull by repetition and bombast and deformed by an indelicacy unknown to Europeans—

..... They loudest sing
The vices of their deities, and their own
In fable, hymn and song, so personating
Their gods ridiculous, themselves past shame.

—*Paradise Regained*.

The most common Sanscrit metre is the stanza of 4 verses, containing 8 syllables.

The following are poetesses, who lived at different times and contributed to the Urdu poetical literature; Atab Begam, Behar and Roshini Jan of Lucknow; Bhangam of Paniput; Begam Jan, the daughter of Nawab Khair-ud-din Khan; Began, daughter of Mirza Babar, belonged to the zanana of Bahadur Shah of Delhi; Beni Jan of Benares; Begam, daughter of Nawab Intizam-ud-Dowla and wife of Asaf-ud-Dowla of Oudh; Begam, daughter of Arnad-ul Mulk Ghazi-ud-din Khan, Mutilabale of Bareilly; Beranija of Delhi; and Nur Jahan, Mirasin of Furakabad. Sakuntala famed in the Indian drama was the daughter of Viswamitra, and brought up by Kanwa Rishi, in whose hermitage she lived. Dushmanta Raja, who had been out on a hunting excursion, happened to meet her and prevailed upon her to be his wife. He left her and told her to follow him. Sakuntala became the mother of a boy, with whom she afterwards appeared before her husband while he was seated in his palace surrounded by his ministers. She approached the raja; and in presenting the boy as his son introduced herself as his wife. The rajah

denied having married her. She said that there was not a greater sin than speaking an untruth while there was nothing more elevating than truth; truth constituted the essence of God. Nor was there a truer friend than a devoted wife who was a help in adversity, a father in religious rites, a mother in nursing, a solace amidst the fatigues of travel. She was afterwards received by the raja.

aculeata —? W. and E. Indies.

elata, Linn., all Peninsular India.

gilliesii, Hooker, Chili.

pulcherrima, Linn., Peninsular India, Bengal, Moluccas.

regia, Bojer., Madagascar.

POINCIANA ACULEATA, the Barbadoes Flower-fence, is a tropical bush, about ten feet high, but covered with masses of inflorescence, showy yellow or red flowers, having singularly long stamens. It is among the most beautiful of plants. In the East Indies, it is common in gardens, flowering and seeding all the year round. The leaves when bruised have a smell of savin, and are said to have the power of bringing on abortion. They are well-known to be purgative, and to have been used as a substitute for senna. According to Roxburgh, the trunk when old, is constantly hollow, and occupied by a large red dark brown ant. From this place, when disturbed, the ants issue in swarms, and inflict a severe and painful bite on their disturbers.—Eng. Cyc.

POINCIANA CORIARIA, Jacq. Syn. of Cæsalpinia coriaria.

POINCIANA ELATA, Linn., Roxb., W. & A.

Nirangi,	CAN.	Suncaishle,	TEL.
Pade Narayan,	TAM.	Sunkeswaram,	"
Chitikeswaram,	"	"	"

A small tree of the Peninsula of India, with large yellow flowers. It has been successfully used as a protection for the footings of rivers and channel banks. Where it is not wanted to spread laterally and to cause obstructions, it should be planted in cuttings in December; it grows quickly; its wood might be used for basket boats. The tree affords a grateful shade, and though continually stripped of its leaves, which are extensively used for manuring

POINT PEDRO SHOAL.

indigo fields in Cuddapah, it quickly replaces them and that abundantly.—Dr. Cleghorn.

POINCIANA GILLIESII, Hooker, a tree of Chili, with sulphur flowers.

POINCIANA PULCHERRIMA, Linn., Roxb., W. & A., Rh.

Cæsalpinia pulcherrima, Swartz.

var. (a) bicolor, flowers orange variegated with crimson.

var. (b) concolor, flowers throughout bright yellow.

Spanish carnation,	"	Rela? Turayi,	"

A tree of both Peninsulas of India, Bengal and the Moluccas, and cultivated all over India.

The variety with yellow blossoms is occasionally seen in the Burmese gardens. It is commonly cultivated at Ajmeer; it is very hardy, grows to the height of five or six feet, the leaves during the rains are green, and afterwards become of a bright scarlet having a most showy appearance. It is easily propagated by cuttings, both leaves and bark contain a milky juice which when dried and boiled possesses some of the properties of gutta percha, its large vermillion-coloured floral leaves render it, a very ornamental plant.—O'Shaughnessy, p. 317; Mason; Genl. Med. Top., p. 192; Riddell.

POINCIANA REGIA, Bojer.

Royal poinciana.

This gorgeous shrub was introduced from Madagascar into India, bears a most magnificent and graceful flower; showy coloured flowers, bright scarlet variegated with yellow. It flourishes well in the Tenasserim provinces. This tree does not attain a great size, but it is very pretty and should be planted in mixed avenues.—M. E. J. R.; Mason; Madras Hort. Garden Cat.

POINT DE GALLE. Its flag-staff, is in lat. 6° 1½' N., and long. 80° 17' 42" E. The town and fort are built on the point which is rocky and bluff to sea-ward, with a rocky islet near, called Pigeon island, surrounded by smaller ones. The entrance of the bay is about a mile wide, and there, as well as inside, the depth of water varies from 2 to 14 feet. It is 70 miles S. E. of Colombo, and is a fortified sea-port town, having the only good harbour on the southern coast of the island. It was formerly in the possession of the Dutch, by whom the fort at the entrance of the harbour was built.

POINT PEDRO, in lat. 5° 38' 40" N., long. 95° 31' E., bears 9 miles E. 22° N. from Acheen roads. See Tanjong bato.

POINT PEDRO SHOAL. A dangerous shoal, which encompasses the N. E. extremity of the island of Ceylon.

POIS, Fr. Pease.
POISON.Tuh-yoh, CHIN. | Kwan-yoh, CHIN.
Lau-hway-jin-tih-yoh, " | Zahr, HIND., PERS.

Poisons are largely used in British India, for criminal purposes, and amongst the Mahratta races, opium mixed with sweet oil is commonly used by suicides. The ordinary plant used to stupify is the Dhatura. In China, the most common and convenient drug is opium. Mandarins of high rank wear on their persons a small bead, filled with what is called peacock's blood, which it is said they take when they wish to destroy themselves suddenly. The Bikh poison of the Himalaya is largely used to poison tigers. Dr. Buchanan first acquainted the European world with the existence of four kinds of Bikh. 1, Singya Bikh, 2, Bish or Bikh, the poison, 3, Bikhma, a powerful bitter, 4, Nirbisi; also without deleterious properties. The first, Dr. B. referred to a species of *Smilax*. The specimens of *Caltha*; *Nirbisi* and *C.*? *Codia* of Dr. Buchanan, appear to be Dr. Wallich's *Aconitum ferox*, while those of *C.*? *Bishma*, his *Aconitum palmatum*, all evidently in a young state, and without flowers or fructification. The virulent poison, emphatically called Bish, *i. e.* the poison, is the root of *Aconitum ferox*. The substances used for poisoning rivers in order to obtain fish, are *Croton tiglium*, *Anamirta cocculus*, *Capsicum frutescens*, and *Kare kai* (Tulu), a *Posoqueria*, probably *nutans* or *longispina*. The inhabitants of Mysore and Coorg habitually poison with impunity such portions of the rivers as lie within their limits. Two years discouragement of poisoning and one year's discouragement of fine cruives, worked such a change that marked advantages can be reaped from the adoption of these two simple measures alone. Pulped as coffee now is, a great quantity of water is defiled, and the river for miles down is rendered literally as dark as porter, and as foetid as flax water. Even after it commences to clear, the stones are all coated with slime. The expressed juice of the root of *Maranta arundinacea* is stated to be a valuable antidote to some vegetable poisons, and also serviceable in cases of bites or stings of venomous insects or reptiles.—*Royle's Ill. Him. Bot.*, p. 46; *Simmond's Commercial Product*, p. 627.

POISON OAK.

Yen-fu-tsze, CHIN.

This is the *Rhus semialata*.POISON BULB, ENG. *Crinum asiaticum*, *Willd., Herb.*POISON NUT, ENG. *Strychnos nux vomica*.POISON TURNIP, ENG. *Cicuta virosa*.

POISSONS, FR. Fish.

POITA, SANS., from *Opa*, and *veeta*, pure. The poita or jandiam is worn as a sacred cord

by brahmins, by all the Parsee race, by the Kshatrya, the Rajput and all the Vaisya race of hindoos. There is a class of artizans in southern India, engaged in five avocations viz.:—

Goldsmiths, Komsala.	Braziers, Komsagara.
Carpenters, Wodla.	Stone cutters, Sungtrash.
Blacksmiths, Komala.	

who all wear the Poitu or Zonar. They are Sudras, and are divisions of the same race, for they intermarry. See Acharya, Rhadia, Zonar.

POIVRE, FR. Black pepper. Poivre D'Es-pange, FR. Cayenne pepper. Poivre long, FR. Long pepper. Pepper.

POIVREA COCCINEA, W. Ic.

Combretum coccineum, Lam.

" purpureum, Roxb., Vahl.

Scarlet poivre, Eng.

This, is the popular favorite amongst the climbing plants in Madras; requires a trellis not too high, the sooner it gets a procumbent position the more luxuriant it will grow and flower, unfit for pot cultivation, easily propagated by cuttings of the young wood in sand under glass. Native of Madagascar.—*Jaffrey; Hints to Amateur Gardeners*.

POIVREA GRANDIFLORA. Syn. of Combretum grandiflorum. Similar to the above in habit but having far superior flowers. Native of S. Leone.—*Jaffrey*.

POIVREA ROXBURGHII, DC.

Tha-ma-ku, BURM.

Among the fibrous barks sent from Assam to the Exhibition of 1851, was one that was named Roxburghia in the Catalogues. This was no doubt a mistake for some plant called after Dr. Roxburgh, probably *Poivre roxburghii*, one of the Combretaceæ, of which several are remarkable for tough wood as well as bark.—*Royle's Fib. Pl.*, p. 301.

POJO, HIND. A tree of Chota-Nagpore, with a soft, white wood.—*Cal. Cat. Ex.* 1862.

POKA; Poka chettu; Oka vakha; Kunda-poka; Kola-poka, TEL. *Areca catechu*, Linn., Roxb. The variety Kola-poka has long nuts.

POKA BANTI, *Ageratum conyzoides*, L.—R. iii, 415; Br. 691. This common weed is commonly known as "Goatweed."

POKA CHIETTU, or O'ka, TEL. *Areca catechu*, L.—R. iii, 615; Cor. 76; Rheede, ii, 5-8.

POKA MAMADI, TEL. Literally "nut mango," SANS., syn. *Kushdramah* signifies "bad mango," ? *spondias*.

POKHRAJ, HIND. Topaz; Zafrani and Zard are the varieties of it.

POKARA, TEL. *Terminalia paniculata*.

POKHAR-MUL, HIND. *Dolomiaea macrocephala*, also *Spilanthes oleracea*.

POKO NEREI, a tree growing amongst mangroves at Singapore, used to prevent diarrhoea.

POL, Sans. A gate : eastern or sun gate is *Scoruj-pol* ; *Bal-pol*, 'the gate of Bal,' the sun-god.

POLA, see Kalkas.

POLA, or Pula, HIND. *Kydia calycina*, also *Crotalaria burhia*.

POLA, a hindoo festival, when bullocks are ornamented and paraded throughout the towns and villages.

POLACH, HIND. *Albizzia odoratissima*.

POLAI, a tree of Singapore, its wood is used to make floats for fishing-nets, a very remarkable light white wood, and might probably be exported, and used with advantage as a substitute for cork, and some similar substances. See *Phyc*.

POLANISIA, a genus of plants of the order Capparidaceæ. Dr. Wight gives, *Polanisia burt-porensis*, *chelidonii*, and *icosandra*. The genera *Cleome* and *Polanisia*, of this order, embrace several species with supposed medicinal virtues. Ainslie describes five species. The *Cleome felina* (cats cleome, *Eng.* *Swarnakshira*, *Sans.*) is used as an astringent in northern India and Ceylon. The *C. pentaphylla*, (*Hurhuriya*, *Beng.* *Caraila*, *Hind.* *Hoolhool*, *Duk.* *Caravela* and *Varsar*, *Sans.*) affords small, black, rather aromatic seeds, used by the natives in decoction as a stimulant drink in low fevers, and in some forms of convulsion. The expressed juice too is considered stimulant, and sudorific. The *C. viscosa*, or viscid *Cleome* (*Hoorhooria*, *Hind.* *Savana barbara* *Sans.*) is also celebrated for its seeds, the *Chori-ajocain*, of the bazaars. These are believed to be vermifuge and stimulant, and are given to the extent of a tea spoonful twice daily, (Ainslie). The *C. dodecandria* and *icosandra* of Ainslie are identical with this plant, and are described by Lindley as *Polanisia icosandra*. In Cochin China the whole plant bruised is used like sinapisms for counter-irritation, and blistering. This fact deserves attentive experimental investigation.—*O'Shaughnessy*, p. 206 ; *W. Ic.*

POLANISIA CHELIDONII, DC.

Cleome chelidonii, *Linn.*

Of the Peninsula of India, with large rose-coloured flowers ; seeds pungent, are powdered and used in curries.

POLANISIA FELINA, DC.

Cleome felina, *Linn.* | *Aria-vila*, *Malabar*.

This small plant grows at Courtallum, and is used medicinally.—*Voigt*, p. 75.

POLANISIA ICOSANDRA, W. & A.

Cleome icosandra, *Linn.* *Cleome viscosa*, *Roxb.*

Cleome dodecandra, *Linn.*

<i>Hurhuriya</i> , <i>Beng.</i> , <i>Hind.</i>	<i>Kukka vaminta</i> ,	<i>Tel.</i>
<i>Kat-kuddaghu</i> ,	<i>Nela vaminta</i> ;	
<i>Naia-veli</i> ,	<i>Podda vaminta</i> ,	"
<i>Nahi kuddaghu</i> ,		

A plant of both peninsulas of India, of Bengal, Nepal, Saharunpore. The bruised leaves

are used in Cochin China as a counter-irritant in the same way as sinapisms in Europe, and as a vesicant. The root is used as a vermifuge in the United States of America. The seeds are employed medicinally in India, and sold in the bazaars under the name of *chori-ajocain*, they yield an oil when subjected to very powerful pressure, which is of a light olive-green colour.—*Eng. Cyc.* ; *Mason*. See *Oil*.

POLAO, a savoury dish made of rice, and fowl or mutton or beef, with cardamoms, cloves.

POLATNO, Rus. Linen.

POLAVA, TAM.? A Tinnevely wood of a light brown colour. Used for musket stocks, and building purposes.—*Colonel Frith*.

POLE, Captain, an English officer who fell at the taking of the Travancore lines in A. D. 1809, and was buried in a sandy waste, 25 miles from the scene of battle. A few years after, the Shanars of the neighbourhood commenced the worship of his spirit. It consists in offering to his manes, spirituous liquors and cheroots.

POLE-CAT. The Black-faced Pole-cat of Tibet, has a tail one-third of the entire length. Soles clad. Fur long. Above and laterally, sordid fulvous, deeply shaded on the back with black. Below, from throat backwards with the whole limbs and tail, black. Head pale with a dark mask over the face. Snout to vent 14 inches. Head less 3. Tail only 6. Tail with hair, 7. Palma 1½. Planta 2½. Habitat, the plain of Central Tibet. A specimen of this interesting animal was obtained in the district of U, on the south of the Sanpu, and was brought along with a specimen of the Tibetan Badger (*Taxidea leucurus*). The skin was in good condition, and had the limbs and scull complete, seemingly a male, and certainly, a mature animal. The length from snout to vent is 14 inches and the tail is 7 more, so that *touffaeus* only of Tibet, and *Flavigula* of the Himalaya, can compare with it in size.—*Mr. Hodgson in Beng. As. Soc. Journ. No. vi., May 1849.*

POLEEYOR, Guz. A tombstone raised over a peasant who had fallen in defence of his homestead.

POLEMONIACEÆ, Lindl. The Greek Valerian tribe of 3 Gen., 6 spe. viz., 2 *polemonium* ; 2 *gilia* ; 1 *collomia* ; 1 *caldasias*. See *Collomia coccinea*, *Gilia achilliaefolia*, *Leptosipon*.

POLERROI, Prostoi : *Schaffran Rus.* Safflower.

POLEYAN of Malabar are domestic or aggressive slaves.

POLI, HIND. *Eryngium planum*, also *Carthamus oxyacantha* and *Cousinia calcitrapæformis*.

POLIAN, HIND. *Carthamus tinctorius*.

The common tuberose. Cultivated in gardens, flower worn by native women in their hair.—*Graham*; *Thomson's Record of General Science*, Vol. iv, 301.

POLICHI, MALEAL. Hibiscus sabdariffa, Linn.

POLIGAR. This word appears to have been anciently used for a freebooter; and phond poligar, one who lived on black mail. As the weakness of the Moghul empire increased, and the terror inspired by the insurgent feudatories and marauding chiefs extended over the south of India, this word came to be applied to all who had set up for themselves, whether from choice or absolute necessity. The most northern Poligar chief, was the Dessae of Sawunt Warree. Those of Jooneer and Punala were reduced by Sevajee. The poligars of Southern India occupy a very prominent station in the animated contests, between the first British adventurers and the native powers, as described by Orme. Prant was an ancient hindoo term, signifying a considerable subdivision of a county.—*Jervis's Geographical and Statistical Memoir*, p. 81. See Polygar.

POLIOÆTUS ICHTHYÆTUS, Horsf. The White-tailed Sea Eagle.

Pandion lineatus, Jerd. Ichthyætus lucarius, Ills.
Ichthyætus bicolor, Gray. Halietus plumbeus, „
horsfieldii, Hodgs.

Mach-moral, BENG. | Mudhuya, HIND.

This eagle is rare, south of the Nerbudda, but common in Hindustan, Burmah and Malayana. It lives chiefly on fish, but will carry off a teal or wounded duck.

POLIOÆTUS HUMILIS, Temm. A minia-ture of the last, is found in Malacca and the islands. It is the I. nanus of Blyth.

POLISHING SLATE, Polier Schiefer, a mineral, occurring massive, with a slaty texture. Its colour is white, yellowish-white, or yellow, brittle, opaque. Specific gravity 0.59. It is found near Biliu in Bohemia, at Zwickau in Saxony, and Auvergne, and is supposed to be a volcanic product. Its analysis by Bucholz gives 100 parts,

Silica ...	83.5	Oxide of iron ..	1.6
Alumina...	4.0	Water	9.0
Lime ...	8.5		

—*Eng. Cyc.*

POLO, HIND. Tibetan game of hockey on horse-back.

POLOSINA a name used by Hwen Thsang for mount Paresch or Aparasin of the 'Zend Avesta,' and with the Paropamisus of the Greeks, which included the Indian Caucasus, or Hindu Kush. Hwen Thsang states, that to the north-west of the capital Capisene or Opian there was a great snowy mountain, with a lake on its summit, distant only 200 li, or about 33 miles. The district of Capisene is first mentioned by Pliny, who states that its ancient capital, named Capisa, was destroyed by Cyrus. His copyist, Solinus, mentions the same story, but calls the city Caphusa, which the Delphine editors have altered to Capissa.—*Cunningham's Ancient Geog. of India*, p. 19.

POLLANARRUA, a ruined city in Ceylon, its capital in the middle ages. It was captured and sacked by the Tamil invaders in A. D. 1023, recovered by Wijao Bahu in 1071, but again plundered in A. D. 1204. These ruins are the most extensive and best preserved in Ceylon. There are many gigantic stone figures of Buddha, and the remains of various temples and other buildings compared with those at Tissemaharاما, these ruins are modern, only dating from A. D. 718 and though looked upon as entirely buddhist remains both the Delada Malagawa, and the Jagta-maharاما more nearly resemble the hindoo temples seen in India than other buddhist temples in Ceylon.—*Frere Antipodes*, p. 186.

POLPA DI CASSIA, It. Cathartocarpus fistula.

POLUII, HIND. Ehretia buxifolia.

POLVORA, PORT. Sp. Gunpowder.

POLVOS DE PELUCA, Sp. Hair powder.

POLYANDRY. As a rule, throughout the south and east of Asia, woman is monandric, living with one husband, but there have been polyandrists in the same region from the most ancient times till the present day. It has been supposed by some that polyandry was peculiar to no division or race of mankind, but was a phase, at one stage of the development of every race. It prevailed amongst the Jews and Arabs, among the Spartans within historic times and among the Celts of Briton in Caesar's time. As a rule, in India, the entire population are monandrists and monogamists. But both polygamy and polyandry are

met with. From the most ancient times, we read of the existence of forms of polyandry amongst various nations, wide apart the one from the other. It still prevails in modified ways, in Tibet; in the Himalaya; amongst some Tamil races, in southern India, and in Ceylon amongst the indigenes, probably also a Tamil race. It is said to be followed in parts of Africa, and also in North America. Humboldt found it common in the island of Lancelota, one of the Canaries. Mr. Sirr, in his recent account of Ceylon, mentions that polyandry was practised in ancient Sparta. For this statement, however, we have not met with any nearer authority than in the somewhat obscure observation of Polybius, (Book iv, chapter iii), in which he tells us that the Arcadians in order to smooth and soften their rough and stubborn dispositions, ruled the study of music and dancing, and appointed frequent festivals and sacrifices, which both sexes were obliged to celebrate together; the men with women, and the boys with virgins. Aristotle, followed by Polybius, (Book xii, Ex. ii), mentions that among the Locrians of Italy all nobility of ancestry was derived from women and not from men. One hundred noble families of the Locrians seem to have migrated into Italy from Asia Minor, along with some of their women, and only the descendants of these women were reputed noble and regarded as descendants of the hundred families. It was from these hundred families that the hundred virgins were taken by lot, as the ordeal had commanded, and were sent to Troy. They had amongst them an institution which they had adopted from the people of Italy, amongst whom they were mixed. At the time that they drove the Sicilians out of this part of Italy, the latter had a custom of appointing a young man to lead the procession in their sacrifices, and he was always chosen from the noblest and the most illustrious of their families. But instead of a young man, the Locrians appointed a virgin for the office, because nobility among them was derived from women. The one brother after another succeeding to a widow, among the Jews, alluded to in the question of the Sadducees, may have the relation to the Asiatic polyandria, that a normal state has to an abnormal. Indeed we read in ancient scripture of the son succeeding to or taking his father's wives. And Marco Polo tells us that amongst the Mongols, in the time of Kublai Khan, brothers took deceased brothers' wives, and sons the wives of their fathers, their uterine mother excepted. In the west, Cæsar, (lib. v., ch. xiv), says of the Britons of his time "*Uxores habent deni duodenique inter se communes, et maxime fratres cum fratribus, et parentēs cum liberis. Sed si sunt ex his nati, eorum habentur liberi a quibus primum virgines quæque ductæ*

sunt." "Ten and even twelve have wives common to them, and particularly brothers among brothers and parents among their children; but if there be any issue by these wives, they are reputed to be the children of those by whom respectively each was first espoused when a virgin." And it may be that the "bundling" is but a partial continuation of another social custom of the ancient Britons, who often contracted conditional marriages. But Dr. Vaughan, in his *Revolutions in English History*, (pp. 97 and 98), questions if Cæsar's knowledge of the Britons was such as to warrant his making that statement. He grounds this scepticism on his belief in the natural instincts of barbarians which operate as powerful safeguards of the chastity of women, and on the fact that among the Britons, according to Pomponius Mela, iii, 2, women were held in high estimation; shared in the honors of priesthood; had the gifts of inspiration, prophecy, and of working miracles—and like Boadicea and Cartimandua ruled in failure of male descent. He notices the silence of Diodorus and Strabo as to the custom of polyandry, though both were familiar with what Cæsar had written, and he mentions also his disbelief of the statement of Xiphiline, who attributes the usage imputed to the Britons by Cæsar, to the Caledonians in the time of Severus. Dr. Vaughan also disregards the authority of Dion Cassius, who wrote two centuries later, in which a British woman, is made to say in defence of her country-women, that they only did openly with their equals, what the Roman women did secretly with their inferiors. The high feelings of the Britons on the purity of their women, he considers established by the fact that it was the wrong done to the chastity of the daughters of Boadicea that filled the cup of indignation among the Britons to overflowing, and the statement of Tacitus, that it was the scandalous proceeding of Cartimandua, in marrying beneath her rank, that helped to produce such disaffection among her subjects as to compel her to fly to the Romans for protection. But when discrediting Cæsar, as to the Britons, and Xiphiline, as to the Caledonians in the time of Severus, from the disaffection produced by the marriage of Cartimandua beneath her rank, Dr. Vaughan was not perhaps aware that the same would result were a Nair woman of the present day to consort with an inferior. Polyandry received a partial sanction in the Institutes of Menu. It is adverted to without reproach in the epic of the Mahabarat, wherein the heroine Draupadi, is made the wife of five Pandu brothers. The Mahabarat details the fortunes of the five Pandava princes and the history of their adventures in an archery contest, at the court of Drona. The

character of the reward to be given by the king to the most successful archer was unknown but the five Pandava brothers agreed to divide the prize if any of them should prove the winner. The third of the brothers, Arjun was declared victor and received as his prize the king's daughter, Draupadi, who was considerably surprised to find that she was equally the property of his brothers, or possessed five husbands instead of one. Arjun and his wife and her other four husbands, lived for some years at the fort of Bairath the remains of which, or rather of a Ghorka structure on the same site, are still visible on a hill near the north-west corner of the Dhoon.

Polyandry, though almost universal in the hill districts attached to the Dhoon, called the Jounsar and Bawar pergunnah, is apparently unknown in the hills of Gurhwal and Kemaon on the east, or those of the Simla superintendency on the west. In the Jounsar district, when the eldest brother marries, the woman is equally the wife of his younger brothers, though the offspring are called the children of the eldest brother. When much difference exists in the ages of the brothers of a family, the elder marry a wife, and when the younger grow up, they marry another but the two wives are considered equally the wives of all the brothers. Mr. Dunlop in his hunting in the Himalaya, p. 181, observes, that wherever the practice of polyandry exists, there is a striking discrepance in the proportions of the sexes among young children as well as adults. In a village with upwards of 400 boys, there were only 120 girls. He does not suppose that female infanticide prevails or is the cause of the preponderance, as a wife is generally purchased for a large sum from her parents. But in the Gurhwal hills, where polygamy is prevalent, there is a surplus of female children.

Polyandry never found any place in the brahmanical code, when the five Pandava were remonstrated with, by king Drupada, for making his daughter Draupadi their joint wife, Yudhishtira, the eldest, according to the Mahabharata replied to him that Jatila, of the family of Gotama, an excellent woman, had lived with seven saints: and that Varkshi, the daughter of a Muni, resided with ten brothers all of them called Pracheta, or men whose souls had been purified by penance. These two arguments leave no doubt but that polyandry was then an institution in India.

The Satyayoga or golden age is thus described:

O lovely age, by brahmins fam'd
Pure Setye yug in Sanscrit nam'd!
Delightful! Not for cups of gold,
Or wines a thousand centuries old;
Or men, degenerate now and small,
Then one and twenty cubits tall:

Not that plump cows full udders bore,
And bowls with holy curd ran o'er
Nature then reigned and Nature's Laws.
When females of the softest kind
Were unaffected, unconfin'd,
And this grand rule from none was hidden
What pleaseth hath no law forbidden.

The Brazen age has been thus noticed:

Not such the Dwaper yug! ah then,
Preposterous that one bipped vain
Should drag ten housewives in his train
And stuff them in a gaudy cage
Slaves to weak lust or potent rage,
One Buxom Dame might wed five men;
True history in solemn terms,
This philosophic lore confirms;
For India once, as now cold Tibet,
A group unusual might exhibit,
Of several husbands, free from strife,
Linked fairly to a single wife!
But, lest my word should nought avail,
Ye Fair, to no unholy tale
Attend: five thousand years ago,
As annals in Benares show,
When Pandu chiefs with Curus fought,
And each the throne imperial sought,
Five brothers of the regal line
Blazed high with qualities divine
The first a prince without his peer,
Just, pious, liberal Yudhishtair:
Then Arjun, to the base a rod,
An hero favoured by a god;
Bhima, like mountain-leopard strong
Unrivalled in the embattled throng,
Bold Nacul, fir'd by noble shame
To emulate fraternal fame;
And Sehdeo, flushed with manly grace,
Bright virtue dawning in his face:
To these a dame devoid of care,
Blythe Draupady, the debonair,
Renowned for beauty, and for wit,
In wedlock's pleasing chain was knit.

McClelland (p. 180) gives a long list of tribes which he regards as Polyandrous, namely, those of Thibet, Cashmeer, and the Himalayan regions, the Toda, Coorg, Nair, and various other races in India, in Ceylon, in New Zealand, (Lafitan, Vol. i, p. 555) and one or two other Pacific islands, in the Aleutian Archipelago, among the Koryak, the Saporogian Cossack, on the Orinoco, in parts of Africa and in Lancerota. To these he adds the ancient Britons, some of the Median cantons, the Picts, and the Getes, while traces of it occurred among the ancient Germans. To these Lubbock adds that of some families among the Iroquois.

In Ceylon, the joint husbands are always brothers. (Davy's Ceylon, p. 286). But, on the whole, lawful polyandry (as opposed to mere laxness of morality) seems to be an exceptional system, generally intended to avoid the evils arising from monogamy where the number of women is less than that of men.

It has existed from time immemorial in the valley of Kashmir, (Vigne, vol. i, p. 37), in Thibet, and in the Sivalik mountains. It is found in Sylhet and Cachar (Jo. As. Soc. Ben., vol. ix, p. 834). Among the Coorgs, and on

the Neilgherri hills among the Todas. And it regulates the laws of inheritance amongst peoples in the southern extreme of the Peninsula of India. The prevalence of polyandry in the Vedic times, is shown in Kashivat saying, "Aswins, your admirable (horses) bore the car which you had harnessed, (first) to the goal, for the sake of honour, and the damsel, who was the prize, came through affection to you and acknowledged your (husband-ship) saying, you are my lords." But polygamy was likewise known, for Kashivat, an illustrious Rishi, married ten sisters at once, and this practice continues to the present day, for the last rajah of Tanjore who died in 1855, a Mahratta sudra and descendant of Sivaji, married eighteen young women at once.

Turner mentions that the Tibet women in his day, with their three or four husbands, were just as jealous as a Mahomedan polygamist is of his several wives. He saw one woman who had five husbands alive, all brothers, though the chief, indeed real, husband is the elder brother. Major Cunningham remarks that amongst the Bhoti, of Ladak, polyandry is strictly confined to brothers. Each family of brothers has only one wife in common. The most usual number of husbands is two, but three and even four husbands are not uncommon. This system, however, prevails only among the poorer classes, for the rich, as in all eastern countries, generally, have two or three wives, according to their circumstances. Polyandry, he adds, is the principal check to the increase of population, and, however revolting it may be to our feelings, it was a politic measure for a poor country which does not produce sufficient food for its inhabitants. Vigne in his *Travels in Kashmir*, (vol. i, p. 37), remarks that amongst some of the natives of the Alpine Bengal, the custom, it is well known, prevails, of one woman being married to a whole family of brothers. The Palam or Bor Abor in north eastern India, are polyandrous, and it is not uncommon for an Abor woman to have two husbands, brothers, living under one roof, and other authors mention that the Bhot races occupying the Tibetan Himalaya, lend their wives, or assent to their cohabitation with strangers and travellers.

Polyandry may also somewhat explain the comparative indifference with which some races regard the purity of their unmarried women. And this view is supported by the still existing hindoo belief as to the visits of the gods to certain women, this is an ancient belief of the Arian hindoos, as of the Greeks and Romans, and it is alluded to in the mythological history of the origin of the Pandava heroes now demi-gods. Descended from the ancient sovereigns of the countries of Hindustan bordering upon the Jumna, called "Panduan raj," or the kingdom of the Pandus, Pandu, the

father of these five heroes, was the son of Vyasa and Pandeia. Their mother's name was Kunti, the sister of a prince of Mathura, who was the father of Heri and Baldeva, the Indian Hercules. Kunti, in consequence of the sins of the ancestors of herself and her husband, was doomed to experience the greatest curse that can befall a hindoo woman, sterility. However, by a charm, she contrived to remove the anathema by enticing the gods to her bed. Thus, says Colonel Tod, from whose disquisition on the Hindoo and Theban Hercules, Coleman extracted this account, she had by Dhermaraja (Yama or the Minos of the Greeks), Yudishtra; by Pavana, Bhima; by Indra, Arjun; and Nycula and Sydiva by the Aswini Kumara (the Hindoo Esculapins, or the sons of Surya), the twins of the Hindoo zodiac, (Cole. Myth., Hind., p. 248.) Polyandry prevails amongst the Tibetans in the hills south and east of Kashmir. But, over all Kamaon, amongst the richer people, the custom of many brothers having one wife in common has long ceased to be practised, though the widow of an elder brother is commonly re-married to the next brother. This is also said to be the custom with some Jat tribes. The Chamar or leather workers of Kunawar, however, like the Bhot still practice polyandry. Amongst the Toda and Kurumbar of the Nilgiri mountains, the brothers of a family have usually only one wife between them. She is, moreover, allowed to consort with strangers, without the slightest objection or jealousy on the part of her proper lords.

Polyandry prevails in Travancore and in the two provinces of the Madras presidency, called Malabar and Canara, about 300 miles long, and 50 broad, with upwards of 36 millions of people. Mr. Strange fully describes it (*Hindoo Law*, p. 67) when he says, the inheritance runs in the female, and not in the male line. A man's sons are not in the list of his heirs. His property goes to his sisters, sister's sons, sister's daughters, sister's daughter's sons and daughters, mother, mother's sisters and their children, and to his maternal grandmother, her sisters and their children. Failing these and their stock in the same way of descent, it goes, as in other parts of the Madras presidency, to the man's disciple and fellow-student, and then escheats. This rule of descent is termed Marumakatayam, or Nepotism in the female line. The origin of this, he adds, is stated to have been in the time of Parasuramen, the first king of Malabar, who introduced brahmins into the district, and gave them possessions therein, and to prevent these properties from being split up, decreed that they should vest in the elder brothers, whom alone he permitted to contract marriage. The sons of these were to be accounted as sons for

the whole family. The junior brothers being without wives are allowed to consort with females of lower classes. The offspring of these unions not being legitimate, could not rank as brahmins, or inherit from their fathers. Their inheritance was hence made to follow from their mothers. The lower castes fell into the same system of promiscuous intercourse amongst themselves. With them, the females before attaining maturity, go through a form of marriage, the bridegroom not necessarily taking the position of husband. After maturity, they may consort with whom they please, and with as many as they please, provided that the connexion be with members of their own or some higher caste. The offspring succeed to the estate in the mother's family, it being obvious that parentage cannot be traced out in the line of the male. The castes that follow this rule of Marumakatayam, are all, excepting Brahmins and Aka Podwals, a class of pagoda servants, the artisans, viz., carpenters, brass-smiths, black-smiths, and gold-smiths and some of the lowest denominations, such as the Cheromars, or slave tribe; with the Malayars and the Paniars, the rule of descent is to sons. The Tear or toddy-drawers, and the Mookwa or fishermen of North Malabar, follow Marumakatayam, while those to the south observe Ma-ka-tayam, or descent to sons. In North Malabar, most of the Mopla, Ma-pilla, mother's son, although mahomedans, follow also the rule of Marumakatayam, in this respect having conformed to hindoo usage, in the times of the ascendancy of the hindoos. The adherents to Marumakatayam form united family communities termed Tarwaad. The remotest member is acknowledged as one of the family, if living under subordination to the head of the family and taking part in their religious observances. The senior male of whatsoever branch is the head of the family and is termed Karnaven. The other members are termed Anandraver. There is nothing analogous to the state of widowhood as existing elsewhere; females whether in alliance with males or not, reside in their own families. In theory, the property is held to vest in the females only, the males having right of management and claim to support. Practically, the males are co-sharers with the females. In default of males, females succeed to the management of the family property. In some families the management devolves on them preferably to the males, and in such case the senior female takes it. All members of the family, even the remotest, are entitled to maintenance. On failure of sister's progeny, male and female, the head of the family may make adoption. The descent being in the female line, the adoption must be a female. In view of the probable

minority of her offspring at the period when the management may fall in, a male, her brother, may be taken, in adoption, at the same time with herself, in order to afford provision for the administration of the affairs of the family, and for conduct of the religious rites to be observed therein.

Part of the peoples here alluded to as practising polyandry, on the Malabar coast, are called Nairs. Dr. Buchanan, writing regarding their social customs and the results from this practice of polyandry in his time, states that they marry before they are ten years of age, but the husband never afterwards cohabits with his wife. Such a circumstance, indeed, would be considered as very indecent. He allows her oil, clothing, ornaments and food; but she lives in her mother's house, and after her parents' death, with her brothers, and cohabits with any person that she chooses, of an equal or higher rank than her own. If detected associating with any man of low caste, she becomes an outcaste. It is no kind of reflection on a woman's character to say that she has formed the closest intimacy with many persons; on the contrary, the Nair women are proud of reckoning among their favoured lovers many brahmins, rajas, and other persons of high birth. In consequence of this strange manner of propagating the species, no Nair knows his father; and every man looks upon his sister's children as his heirs. He, indeed, looks upon them with the same fondness that fathers in other parts of the world have for their own children: and he would be considered as an unnatural monster, were he to show such signs of grief at the death of a child, which, from long cohabitation and love with its mother, he might suppose to be his own, as he did at the death of a child of his sister. A man's mother manages his family, and after her death his eldest sister assumes the direction. Brothers almost always live under the same roof; but, if one of the family separate from the rest, he is always accompanied by his favorite sister. Even cousins, to the most remote degree of kindred, in the female line, generally live together in great harmony: for in this part of the country, love, jealousy, or distrust, never can disturb the peace of a Nair family. The land estate is managed by the eldest male of the family, but each individual has a right to a share of the income. In case of the eldest being unable, from infirmity or incapacity, to manage the affairs of the family, the next in rank does it in the name of his senior. Under these social rules it is not easy to see the inducement to the Nair to marry, as he has the burthen without any of the enjoyments of wedded life. But this legal or authorized practice must have its check in the social or natural state of man,

which, as of most creatures, is one of true monogamy, and proof of this, and yet also of the lateral descent law, is furnished by the account given of the death of a rajah of Travancore, who, in 1860, died of a decline, at the age of 46, after a reign of 13 years. He had been much affected by the death of a lady of his family, and made a pilgrimage to several shrines, practising great austerities and fastings. His medical attendants (Native and European) warned him of the risk in his feeble health, but he persevered, and sank of exhaustion and weakness. His end was suitable to an enlightened prince. He took an affectionate leave of his family, and showed his solicitude for his people by requesting that the custom of shutting the shops for 15 days when a rajah dies, might be dispensed with on this occasion on account of the dearth and distress from which the people were then suffering. On account of the imbecility of the first nephew, the second nephew Rama Verma had long been acknowledged as the first prince by the family and the government, and then ascended the throne.

The law as it prevails in Malabar, has been given above. The following details by Mr. Strange, who long served in that district, will show the curious modifications which increasing civilization and the social customs of other races are effecting amongst these people. Mr. Strange mentions (in *litteris*) that polyandryism in Malabar has prevailed only among those classes whose rule of inheritance is by Nepotism, termed Marumakatayam. It has prevailed in like manner in Travancore, where the same rule of descent is followed. There is, however, a strong tendency in Malabar to throw up the said rule of descent, and to convey property from father to son, and this feeling is owing to the gradual abandonment of polyandryism. The connubial connection which is in question is termed ordinarily in Malabar Goona-dosham, Goona good, Dosham evil (for better for worse.) In Travancore it is styled Mundu-vanga, Moondoo cloth, vanga receiving. The girl taken is of ripe age, and her consent must be obtained. Personal acquaintance thus precedes the formation of the union. The ceremonial consists in the man presenting her with a Moondoo or white muslin cloth. In North Malabar a small sum of money is tied up in a corner of the cloth. Small presents of money are given to brahmins. There is an assemblage of friends at the girl's house and a supper is given either before or after the ceremonial. The hour is about 8 p. m. The girl sometimes is taken to the man's house, and sometimes remains in her own, and is visited by him there. Each party is unrestricted as to the number of such connections that may be formed, but these ordi-

narly do not exceed two or three. The descent being in the female line, the parentage as to the father was immaterial. Jealousies and quarrels, terminating sometimes in murder, are however rife, as might be expected. The connection depends simply upon the will of the parties, and may be broken off by either at pleasure. But, now, the unions in Malabar are commonly of single couples, the woman living in the man's house strictly as his wife. The classes among whom polyandryism has prevailed in Malabar are the Nair, the Teear of North Malabar (those of South Malabar adhering to the descent to sons), and a branch of the slave tribes called Kallady. The term "Nair" is derived from Naiker, the respectful plural of Naik, which comes from the Sanscrit term Nayakah, meaning a chief man. The four classes of workmen in Malabar, namely, the Ashary (carpenter), Mooshaly (brass-founder), Tattan (gold-smith), and Peroon-kollan (iron-smith), still follow a curious form of polyandryism. This is kept up only in the family. The elder brother marries and his wife is common to all the other brothers. If a junior wish to marry, he must live apart, and set up business apart, but if any of those junior to him should reside with him, his wife is common to them. These classes have descent from father to son.

A native writer, Kookeloo, himself a Nair, mentions that Kummaler is the name given in the Malayalam country, to an artificer. The Ainkudi Kummaler are the five artizan castes, the Ashari or carpenter, the Mushari or brazier, the Tattan or goldsmith, the Perring-kollen or blacksmith and the Tol-kollen or tanner. These five castes follow the custom of marrying one girl among three or four brothers, and this Kummaler custom of three or four brothers marrying one girl, is followed in some parts of Malabar by the Eeyoover, Juver or Teer, toddy-drawers, and, partially also, is the custom of the inahomedan Mopilla, in taking the wife of a deceased brother. The Kummaler and Teer are sprung from the same race and in earlier times intermarried, and this may explain the similarity amongst them of this social practice. It is only in the taluqs of Nidunganad, Kuttanad, Chowghat, in some parts of Vettutnad, and a few adjoining spots in South Malabar, that a woman amongst the Nair is kept at the same time by two or three men, who are not brothers. Although the Nair, the Teer and other hindoo castes of Malabar, Cochin and Travancore, particularly by the two latter countries, are thus more or less tainted, the practice of polyandry does not seem to have ever prevailed generally, amongst the Nair and many of the Teer of North Malabar, from Kurumbranad to Mangalore.

But many Teer women, even there, admit to indiscriminate connection all races, of all castes or religions, without incurring any prejudice as to caste or loss in social estimation. The Teer women of South Malabar do not so readily yield themselves to this unusual practice. As this Nair custom is of interest ethnologically, we give the following description of it by one of that race, Kookel Keloo, Nair, district munsiff in Malabar, in No. 48 of the Madras Lit. Soc. Jour., pp. 52-53 of 1859:—

He says "the Eeyooover or Teeyer (toddy drawers) are a section of the servile class of people who, during the time of the brahmins and peroomals, came to Malabar from Ceylon to earn their livelihood. It cannot, however, be accounted for, how they, in many parts, though not throughout the whole of Malabar, came to adopt the beastly custom of the Kummaler of the country, of a single girl, being married to three and four brothers; and likewise in some parts of the country, where this sad custom is not so generally prevalent among them, the practice of taking their deceased brothers' widows for wives as the mussulman Mapilla do. It is only in the taluks of Needoonganad, Cootanad, Chowghaut, and some parts of Vetutnad and a few adjoining spots in South Malabar alone, that a woman among the Nair is kept at the same time by two or three different men, who are, though, never brothers. It is, though, very possible that the Teeyer may have taken the idea from this latter error and themselves fallen into the other and more shameful one, or perhaps they observe the custom as they in general are, as a document in its beginning shows, sprung from the Kummaler or the Kummalers from them, through their then frequent intermarriages. The document calls them also Eeyoovalaiyer, a word equally low and contemptuous in Malabar and of the same meaning as the word Kummaler. Moreover, amongst the Nair of the whole of North Malabar (that is to say form part of Cooroombranad as far as Mangalore), though sometimes unchaste practices occur in their families, yet, I can, he says, most confidently assert, that the above abominable custom of one woman being kept by two or three men at the same time, never in ancient or modern time was once known. A Nair there will, though, occasionally, marry two or three women in succession, if the first or second prove barren or all the children born, die, or from any other like cause or domestic difference. Many of the Teeyers also of that part of the country do in some measure follow the custom of the Nairs; but the Teyettees (Teeyer women), of the remaining Teeyers there, are notorious harlots and become the concubines of strangers of any caste or religion, and this without the least preju-

dice to their own caste, or any loss of esteem in society; on the other hand, any such act proved against any females of the other castes, subjects the person to excommunication from caste, banishment from society, and all religious advantages. The Teeyer females of South Malabar do not, though, so readily as those of the north, yield themselves to this disgraceful practice. Owing to the very great number of castes, and the peculiar and different manners and customs of various parts of the country, the superficial enquiries of most foreigners have led them into error and in their works they generally ascribe the same pernicious practices to all castes and parts of the country indiscriminately. However, the Nairs, Teeyers and indeed all the other numerous castes of Malabar (including the Cochin and Travancore countries, these being indeed the most striking in this respect), are in some way or other in a greater or less degree of error; and reformation therefore is indeed much needed among them all. It is, though, very lamentable to find them dormant in their original state of depression and not seeking for reformation rather than growing blindly proud of their vain and different castes and privileges, and ready to run any risk even that of hazarding their lives, only to preserve their castes." Ashary, in Malabar, the carpenter caste, in common with the brass-founder, gold and iron-smiths, continue the practice of polyandry, but in civil inheritance follow from father to son, and not the old Italian practice of maternal descent, descensus ab utero. The elder brother marries and the wife is common to all the brothers. If a junior wish to marry he must live apart and set up business apart, but if any of his younger brothers reside with him, his wife is common to them. Anandrawer, is the term applied to the junior members of a Tarwaad community living under the law of inheritance called Marumakatayam. See Karnaven, Tarwaad. In the Madras Journal of Literature and Science for July 1864, a native of the country, furnishes a translation of a work entitled the Bhutala Pandyaana, Aliaya Santanada Kattukattale, in which is given the following mythical explanation of the causes which led Bhutala Pandya to frame the Aliyasantana rules. It relates that Deva Pandya, a wealthy merchant of the Pandya country, was sending richly laden new ships to a dark island covered with snow, but before launching them, Kundo-dara, a Bhutaraja, or king of the demons, an attendant on Siva, observing that the ships were new, demanded a human sacrifice. Deva consulted with his wife, as to sacrificing one of his own seven sons, but the wife fled with them to her native town. On which Deva lay in deep distress until his sister Satya-vati, hearing of the

case, came and offered her own boy, saying to Deva, "you should not care for this trifling matter. Do you give the boy Jaya Pandya, a son of mine, as a human sacrifice." But Kundo-dara refused the boy, being aware that Jaya was the son of Vira Pandya, king of that dominion who had been defeated by Chand Rangada raja; and that Jaya was a Mahapurusha, destined to be a great man, he desired Jaya to assume his, the demon king's name, as Bhutala Pandya, and promised to return him to the dominions of which Chanda Ranga had deprived him. On this, the demon king entered Ujein, subdued the eight demigods, Bhairava, &c., gave Bhutala a throne that Davendra had given to Vikramarka, and entered the town of Jayantika, accompanied by Bhutala. On the demise of the king Siddha Vira Prassiddha Raya, Jaya was elected king. Jaya ruled for six years, during which the Makkala Santana, i. e. the law of inheritance by direct descent of sons, was, for the following reasons set aside and that of Aliya Santana, i. e. inheritance on the line of nephews substituted. The ships of Deva had during a mercantile voyage grounded on the miry bank of an island covered with snow and darkness and the crew were in great distress when the demon king appeared and bid them load the ships with the Siddha sile stone (a green stone husuru sile galu) and Siddha-rasam and pray to him. This being done, a fair wind brought the ships to the river mouth of Hangara katte at Kallianpur harbour. King Jaya on ascertaining that the ships belonged to his uncle Deva, sent for him to receive them, but the demon king again demanded one of Deva's sons as a sacrifice. Deva consulted as to this with his wife, who refused the goods on that condition, and the cargo of stone and liquid was then delivered to king Jaya, who placed both the stone and the liquid in front of the idol Someswara, changing its name to Sidh-Eswara, and erected a temple and image to Kundo-dara the demon king, to which he gave the name of Mah-Eswara. On the demon king's recommendation, he framed a code of laws, containing 30 rules, introducing the Aliya Santana rule (the descensus a matre.) At this time, king Jaya is styled "master of the throne of king of kings, master of the masters of the four countries, called Tulu, Malayala, Haiga, and Karnataka, the first person in the era of Sativahana. In the sixth year of his reign, the demon king ordered him to bury the green stone (emerald) and shut up the Siddha-Rasa well, and the image of Naga set thereon. The castes enumerated in these rules, are the

- 1 Tulu varu.
- 2 Mala varu.
- 3 Jainaru.
- 4 Nayanama-varu,

- 5 Masadika.
- 6 Haricetti.
- 7 Paci-varu.
- 8 Kambararu Potters.

- 9 Devadiga.
- 10 Saliyaweavers.
- 11 Mulekudeya.
- 12 Panchala.
- 13 Kshauraka (barbers.)
- 14 Agasa (washermen)

- 15 Halepalka.
- 16 Mundala.
- 17 Karinara.
- 18 Holeya.
- 19 Andekoraga.

King Jaya prohibited the brahmins officiating in death and birth ceremonials; prohibited the Maha-layam or inauspicious ceremony for the deceased; prohibited the giving of the Pancha-gavyam; prohibited the Punya Homa sacrifice with Darbha grass on births and deaths and permitted only the Nirmalya or remains of idol offerings for the dead, and authorised the continuance of the puja and Abhishebam to the deity for those who brought forth children or died. In the twelfth year of his reign, he invited Jains from the Balaghat, and they built Mangalore and other towns. King Jaya made the Aliya Santana rules applicable to the Kshatriya, the Vaisya, and the Sudras, but permitted brahmins to continue the rule of direct descent. The explanation of the above fable seems to be that in the time of king Jaya, all great works, such as ship building, as is still the case in Polynesia, were inaugurated by human sacrifices, in propitiation of demons; that a woman of rank twice refused to part with any of her sons for such a purpose and her husband's sister offered her son Jaya in their stead, but was refused: from which king Jaya declared that descent of property should follow from the sister's side.

As the result of the Aliya Santana rules, it is stated that in the present day the husband during his life gives his personal property to his wife and children, mortgages his permanent property and on his demise transfers it with the debts to the sisters and children, so that the territorial possessions have all fallen to brahmins, mahomedans and christians.

In Canara, a similar system of inheritance obtains to that in Malabar, which is termed Aliya Santana, or Aliya Satana or nephew inheritance. As in Malabar the brahmins do not follow this rule. In its details, the Canara law of Aliya Santana corresponds with that of the Malabar Marumakatayam, saying that the principle that the inheritance vests in the females in preference to the males is in practice better carried out in Canara, where the management of property vests ordinarily in the females, while in Malabar the males commonly administer thereto.

The Aliya Santana of the Tulu country is similar to the old Italian law of descent ab-matris. A sister's children being considered more surely of a man's own blood than those by his married wife. (*Coorg Memoirs*, p. 30.) In the Tuluva country, the brahmin widow can devote herself to the temple, and reside outside or inside its walls. If within, she is a servant of

the idol, and receives other men of her own caste only. The offspring of such, if boys, are called Moylar, and if girls, are said to be given in marriage to the boys. But if the woman elect to reside outside, she must pay a monthly sum to the pagoda, and may cohabit with any one of pure descent.

The Coorgs continue to have a kind of marriage communism within the family, the wives of the brothers of one house are considered as common property. Children, therefore, are rather children of the family or of the mother, than of the ostensible father. The Coorgs quote, as their authority for this custom, the story above related of the five Pandu brothers who had one wife Drapadi. But the state of family-life, in many Coorg houses, resulting from this custom, is very sad, giving rise to jealousy, mistrust, heart-burnings, quarrels, and often deadly hatred. One evening the Revd. Mr. Moegling addressing an assembly of Coorg men on the excellency of Christianity as a rule of life, said, "leaving for a moment out of sight, the salvation of your souls, and that eternal joy and glory, which Christ gives to such as believe in Him, faith in his gospel would render you happy men, indeed, compared with your present miseries.* * There would be one man in each house, living in peace with his own wife and children." The men grew silent and thoughtful, and one near him whispered to his neighbour, "The padre seems to know all about us." At present two or three generations continue to live together in the ancestral home, a large human beehive, the grandfather and grandmother, their sons and daughters-in-law, the children of these families, some houses containing sixty, seventy, eighty souls and upwards; but families are constantly being torn up and separated from the discord that occurs. Dr. Baikie alludes to a somewhat similar community amongst the Canarese speaking races to the north.

The habits of the Coorgs may vary amongst themselves. Reliable information from another source is to the effect that the first to take to himself a wife is the elder brother. But if she remain unfruitful to him, she passes to the next brother, and only when she fails to have offspring to any brother does she become an outcaste from the family. Until abolished by Sir Henry Ward, the Governor, about A.D., 1860, polyandry prevailed throughout the interior of Ceylon, chiefly amongst the wealthier classes, of whom one woman had frequently three or four husbands and sometimes as many as seven. The custom was at one time universal throughout the island, Valentyn, Ch. vi, p. 95, is quoted for the fact that the king of Kotta, Wijai Bahuvij who was reigning when the Portuguese built their

first fort at Colombo had one wife in common with his brother; and raja Singha I, was born in polyandry, but the influence of the Portuguese and Dutch sufficed to discountenance, and extinguish it in the maritime province. As a general rule, the husbands are members of the same family, and most generally brothers. According to the notion of the Singalese, the practice originated in the feudal times, when it is alleged, their rice lands would have gone to destruction during the long absences enforced on the people by the duty of personal attendance on the king and the higher chiefs, had not some interested party been left to conduct their tillage. Hence the community of property led at length to the community of wives. Sir J. E. Tennant in A.D., 1848, was informed to the above effect by an aged chief of the Four Corles, Arunpulle Ratemahatmeya, who had lived under three native kings prior to the conquest of Kandy by the British. In more recent times the custom has been extenuated on the plea that it prevents the subdivision of estates, the children of these promiscuous marriages being the recognised heirs of all the husbands, however numerous, of their mother. But it existed in Ceylon, before the conquest of Wijai. In Ceylon no infamy attaches to such unions and the offspring are regarded as equally legitimate with those born in wedlock. Within a recent period, about A.D. 1860, a law has been introduced, to put a stop to this custom. Sir J. E. Tennant tells us that, in Ceylon, in the province adjoining Bintenne, where the owner's sister's sons inherit, in preference to the sons of the owner's wives, the custom is explained by a Singalese legend to have originated from one of their kings being directed by an oracle to sacrifice a male child of the blood royal, in order to thwart the malice of a demon who nightly destroyed the bund of a tank in process of construction. But his queen refused to surrender one of her children, on which his sister voluntarily devoted her own boy to death: the king in honour of her patriotism, declared that nephews were ever after to be entitled to succession in preference to sons. Also, in the western extremity of the province in Ceylon adjoining that of Bintenne, something like the custom of the peoples of western India prevails, and nephews by the sister's side succeed to the inheritance to the exclusion of the possessor's sons. Singalese kings frequently married their sisters, throughout the interior of Ceylon, at present, among the Kandyans and them only, polyandry is prevalent, and the wife has the possession of all the brothers of whom so many as eight have been known. The children call the eldest brother father. A man can bring in another, not a relation, to have joint martial rights with him-

self; indeed the first husband, can so introduce, as many as the wife will consent to receive as husbands. In Kandy, in the Beena marriage, the husband goes to reside in the wife's house, and the woman shares the family inheritance with her brothers. The husband, in this marriage, can be dismissed summarily, by the family of the wife. In the Deega, a more respectable marriage, the wife leaves her own house for that of her husband—forfeits all her claim on the property of her parents, but acquiring some claim on that of her husband, and the wife cannot obtain divorce, unless with the full consent of the husband. Divorces are constantly sought for by women, on trivial pretences. A child born within nine months of the divorce, must be maintained by the husband.

The customs prior to marriage are not an indication of the married life. International marriages are very frequent among the different tribes that compose the great family of the Selishes in north America. After the union, the man generally joins the band to which his wife's family belongs. The custom, arises from the women being the purveyors of the family; they are better able to maintain their household in a locality known to them and where they can find the nutritive roots, on which these tribes chiefly live. The Indian women, in those regions, are treated with more respect than those of other parts, and enjoy more of consideration and authority. The cabins containing provisions are completely under their control and husbands can never touch anything in these without the permission of the mistress of the house. In Origen, the looseness of morals is not such as might be supposed, considering the ignorance and rudeness of savages. Among the Natchez, the incontinence of the young girls was for them a title of honour for they made marriage portions for themselves by means of the most unrestrained prostitution, the importance of their matches depending on their greater or less licentiousness. But when once married they lead a most exemplary life, and became models of conjugal fidelity. The reason of this change being that having solemnly given themselves up to their husbands, they had no right to dispose of themselves to any one else. The marriage at length was a purchase, however, the young man, saying, here are the presents with which I buy thee of thy parents." Polygamy is restricted among the Indian nations of north America by their poverty. The system of purchase precluding many being bought, but among the rich, several wives are married. The Navajos have a regular harem, the last married wife being the mistress of the house, but an Indian generally chooses sisters, to have peace.

Colonel Marcy of the United States army mentions that though the custom is now very much abandoned, it was formerly regarded by the Comanche Indians of north America as an essential part of genuine hospitality that their guests should have wives assigned to them during their stay in camp. Polygamy is prevalent amongst them, every man having as many wives as he can support. On one occasion in 1849 when escorting emigrants across to New Mexico, two young girls were brought and offered to him before all the party, but to the great surprise of the chief Is-sa-kip they were declined. Among the Moqui Indians of North America, the young woman selects the young man who suits her fancy, and then her father proposes the match to the youth's father, this proposal is never refused. Polygamy is unknown amongst them.

It has existed from time immemorial in the valley in Kashmir, (*Vigne, Vol. i, p. 37*), in Thibet, and in the Sivalik mountains. It is found in Sylhet and Cachar (*Jo. As. Soc. Ben., Vol. ix, p. 834*.) Among the Coorgs, and on the Neilgherri hills among the Todas. And it regulates the laws of inheritance amongst peoples in the southern extremities of the Dekhan. The mean number of inhabitants to a house in various parts of Kunawer is six, Polyandry, or a plurality of husbands, prevails, as also, in Chinese Tartary and in the hilly tracts towards the plains. Besides this drawback on the increase of the population there is another peculiar to Chinese Tartary and the adjoining countries; that is, celibacy, which is professed by numbers of the inhabitants; and in some villages the monks or lamas and nuns form almost half the population.

In Tibet the young unmarried woman is not expected to be chaste and her married life is polyandrous, the woman becomes the wife of all the brothers of the family, not as a perverse law, but as a necessary institution. Every spot of ground within the hills which can be cultivated, has been under the plough for ages; the number of mouths must remain adapted to the number of acres, and the proportion is preserved by limiting each proprietary family to one giver of children. The introduction of mahomedanism in the west, by enlarging the views of the people and promoting emigration, has tended to modify this rule, and even among the Lamaic Tibetans, any casual influx of wealth, as from trade or other sources, immediately leads to the formation of separate establishments by the several members of a house. The eldest brother proposes to a girl's parents, and if agreed to, she is brought to her future home, where a three days carousal completes the ceremony. In the upper valleys of the Sutlej, in Spiti, Kunawer, are mixed races exhibiting

much Tibetan blood, and religion, apparently more buddhist than hindoo. The Tibetan colony at Mahasoo just above Simla are powerful ruddy-looking people, entirely unlike Indians. Their women are industrious but very unattractive. The Tibetan forms an interesting study for the curious in national manners and character. The institution of polyandry indicates a singularly moderate state of the passions, inasmuch as the reproductive instinct, elsewhere allotted to a single individual, is with them divided among a whole family. The eldest son has the privilege of choice, but he shares the lady he marries in common with his brothers, and the whole live amicably together. The higher classes do not encumber themselves even with this divided labour of house-keeping, and rarely marry at all. In such a state of society, female chastity is of course not much valued, till the question becomes intermingled with the rights of property. Before marriage, therefore, a woman may associate with men with but little remark; but after she has entered into the fraternal copartnery, they are taken cognisance of by the law. But even here the frail wife receives a little corporal punishment, the favoured lover pays a pecuniary fine, and the penalty of their sin being thus acquitted, they are freed from its reproach.

In Surmoor, the customary marriage charge to a common peasant or zemindar, is from ten to twenty rupees. The difficulty of raising this sum, and the alleged expense of maintaining women, may in part account for the usage, which is universal over the country. Three or four or more brothers marry and cohabit with one woman, who is the wife of all: they are unable to raise the requisite sum individually, and thus club their shares, and buy this one common spouse. Women are here articles of property. Should the labour of females be of actual profit to those with whom they live, instead of a loss and charge to them, it might partially account for a proportion of females remaining unmarried in the houses of their parents; but it cannot seem a full and satisfactory reason for this great restraint in keeping so large a body of the sexes separate. The custom has a deplorably injurious effect upon the morals of the females in this country, particularly in point of chastity. They do not see it valued, and of course do not preserve it. From the degree of community of intercourse prevailing by custom, the men do not feel shocked at an unlimited extension of it: and the women do not feel the slightest sense of shame in a practice from which they are not discouraged by early education. Of a family of four or five brothers, only one or two are in general at home at the same time: some are out on service as soldiers, or

with the minor chiefs; others are travelling; the elder usually remains at home. If any quarrel were to arise, a common cause would be made against the offender, and ejectment from house and board ensue. The first-born child is the property of the elder brother, and the next in succession are supplied in turn, it was usual always to purchase wives, and the zemindars were too poor to be able to give from ten to twenty rupees for a woman. The polyandry of Ladakh, is noticed by Moorcroft, (*Travels*, ii, 321, 322,) and also in the *Journal of the Asiatic Society of Bengal* for 1844, p. 202, &c. The effects of the system on bastardy seem marked, out of 760 people in the little district of Hung-rung, around the junction of the Sotlej and Pittee (or Spiti) rivers, there were found to be 26 bastards, which gives a proportion of about 1 in 29; and as few grown-up people admitted themselves to be illegitimate, the number may even be greater. In 1835 the population of England and Wales was about 14,750,000, and the number of bastards affiliated (before the new poor law came into operation) was 65,475, or 1 in about 226; (*Wade's British History*, pp. 1041-1055;) and even should the number so born double those affiliated, the proportion would still speak against polyandry as it affects female purity. At Irtoke, in Nepal, there is to a certain degree a sort of community of wives.

If we may credit the statement of Rinso, polyandry prevails amongst the Smerenkur Gilyaks of the Amoor and the women are treated with the greatest indulgence. But, only those can expect to get married who are skilled in the use of the needle; but the custom here, seems of a kind similar to those noticed by Sir R. K. Porter amongst the Kisty tribe in Circassia, and amongst the Torneo in Lapland; also by Colonel Yule amongst the people of Hazlakh, by Marco Polo amongst the people of Kamul and by Sir A. Burnes amongst the Jakuri Hazara. Before the caliphs had extended their principles, with their power, over every part of N. Persia, the reverse of the system of polygamy was prevalent in Atropatia, (now restored to its more ancient name of Azerbaijan;) for there, the ladies estimated their dignity according to the number of husbands they could boast. Half-a-dozen at a time were deemed an inconsiderable conquest; and the woman disgraced, past living in the best society, who could not number more than three or four.—*Yule Cathay*, Vol. i, p. clxxxix; *Panthier*, 157; *Wood*, p. 201; *Burnes' Travels*; *Porter's Travels*, Vol. i, pp. 143-4, 340; *Vigne's Kashmir*; Vol. i, p. 37; *Beng. As. Soc. Journ.*, Vol. ix, p. 834; *Asiatic Researches*, Vol. v, p. 13; *Institutes of Menu*; *Cæsar's Commentaries*, Book v, ch. x; xiv; *Westminster Review*,

E. Tennents, Ceylon; Colonel Marcy, Thirty-seven years Army Life of the Border. See Gen. xi, 29; xiv, 14.
POLYANTHES TUBEROSA.

Shabbo, HIND. | Zambak, HIND.
 Considered by natives hot and dry, diuretic and useful after labor, also in rheumatism. Roots emetic, and used as a dressing for burns. The natives say its seeds are the white Todree of the oriental bazaars which, as also the other Todrees, Europeans supposed to be from Malacca. Whatever they may be they are effective medicine. This, "the tuberoses with her silvery light," introduced into India from Mexico or South America, is cultivated very extensively by the Burmans and in many English gardens. The flower has a delightful fragrance, and throws out its odours strongest at evening.—*Dr. Honigberger, p. 329; Mason; Powell's Hand-book, Vol. i, p. 382.*

POLYBIUS, see *Portunidae*.

POLYGALA SENEGA, Snake root. Several species of *Polygala* are medicinally employed in Germany, South America, and Java. In Nepal and the Himalayas, the *P. crotalarioides* is used as a snake antidote. The stem of this species is branched from the base, suffruticose, decumbent, downy; leaves obovate, wedge-shaped at the base, stalked; raceme 8-10 flowered, wings roundish, obovate, as long as the orbicular, ciliated capsule.—*O'Shaughnessy, pp. 209-212.*

POLYGALA SPECIOSA, grown in gardens as an ornamental plant. All the species of *Polygala* are very handsome, showy flowers, they are natives of the Cape, some parts of Europe and America; their colours are chiefly pink, scarlet, red or white, they are readily grown from seed, and should be raised in a light soil.—*Riddell.*

POLYGALA TENUIFOLIA.

Yuen-chi, CHIN.

The root of this Chinese plant is brought from Shensi and Honan, in contorted quilled pieces. It is used in cynanche, cough, carbuncle, and its leaves in spermatorrhœa.—*Smith's Chin. Mat. Med., p. 175.*

POLYGAMY. Although polygamy is sanctioned by the laws of the mahomedan religionists, by the customs of the Chinese, the Cochinchinese, the Siamese, and, in particular cir-

cumstances, amongst the hindooes, the people generally, are in practice monogamic. Throughout the Old Testament (Gen. xxi; xii, 15; Esther, ii, 3,) there are notices of a plurality of wives, from the most ancient times, but the Jews were truly a monogamic race, and it was only with Saul and David followed by Solomon that numerous wives became usual. Amongst the mahomedans, the practice from Mahomed's time till now, has been to restrict to four wives and the harm or war captives or purchased or household slaves, and in British India, the followers of this faith do not deviate from their religious rules, though, in general they are monogamic. Opinions greatly differ as to the advantages of polygamy. Though the christian peoples of Europe and the hindooes of British India, are monogamic by law, in practice polygamy, with many resulting crimes and evils, is not unknown. With the mahomedans and ruling hindoo races who permit polygamy, it is a fertile source of intrigue and disquiet. Colonel Tod writing of the ruling Rajputs says polygamy is the fertile source of evil, moral as well as physical, in the east. The desire of each wife that her offspring should wear a crown, is natural; but they do not always wait the course of nature for the attainment of their wishes, and the love of power too often furnishes instruments for any deed however base. The number of queens is determined only by state necessity and the fancy of the prince. To have them equal in number to the days of the week is not universal; while the number of handmaids is unlimited. It will be conceded, that the prince who can govern such a household, and maintain equal rights, when claims to pre-eminence must be perpetually asserted, possesses no little tact. The government of the kingdom is but an amusement compared with such a task, for it is within the Rawla that intrigue is enthroned. Captain Burton, who saw the great polygamic system in the Salt Lake city, observes that the nations of Europe have monogamic laws, have forbidden a plurality of wives, and the consequences are that adulteries and unlawful connections prevail to a most fearful extent. And among some of these nations sinks of wickedness, wretchedness, and misery, are licensed by law. He remarks that the doctrine of a plurality of wives was believed and practised by Abraham. Though polygamy is met with among nearly all the nations of southern and eastern Asia, neither amongst the mahomedans or hindooes, is it deemed a respectable practice. A mahomedan by law can marry four wives, and all his captives in war can form his harem, but no mahomedan, however rich, no ruling sovereign even, can obtain a second wife from a family of the same

social position as his own, and amongst Indian mahomedans only one wife is married with all the rejoicings and ceremonial display which in most countries are observed when a bride becomes a wife and mistress of a home. In the profligacy of towns or in the enforced idleness to which so many mahomedans in India, are now constrained, there are sometimes found the legitimate number of wives, along with many hindu converts to mahomedanism, who are styled the "Harm," and occasionally amongst the poorer men who have been great travellers, more than one wife is in a house. But monogamy is the general rule, and marriage is made with the wife for whom the greater rejoicings are made. In mahomedan law, all children born in marriage have equal rights. In India, therefore, where women are married either simply by the Nikkah ceremonial or by the additional display in the Shadi or rejoicings, the mahomedan law does not recognize any distinction in the rights of the children from Nikkah or Shadi wives. But, in the social customs of the mahomedans of southern India, a great distinction is made between the offspring in the two marriages. A Nikkah wife never receives the same amount of respect from her household, and from relatives, and never receives from her husband an equal monthly allowance to that of a Shadi wife. The Nikkah and Shadi children in their father's households, receive equal courtesy from relatives, because they are then alike looked upon as the children of the master of the house. But a father never grants to Nikkah children allowances equal to those which he apportions to those of his Shadi descent. When parents are seeking for suitable marriages for their children, Nikkah offspring are regarded as greatly inferior in social rank to Shadi offspring, and the taint of the Nikkah marriage is remembered from generation to generation, men who marry by the Nikkah ceremony take such wives from families of inferior rank to themselves, or from women of very low position, while wives who are married by the Shadi ceremony are always of equal rank to the men. As a rule then, Nikkah wives and Nikkah children do not receive incomes equal to those of the Shadi relation, and the courtesies and respect shewn to them in their families and by the outer world, are greatly less than those which Shadi wives and children receive. The enforced idleness to which British supremacy has subjected the hereditary soldiery and chiefs of India, few of whom have inclination for intellectual pursuits, with their means for hunting and hawking and other field sports diminished, there have grown up amongst them many loose ideas, loose ways, and low habits, but, even in all this, the Indian people are monogamists. Among the Mewan

mahomedans their Pir, or holy men, are of the family called Rashid Shahi (descended from one Mahomed Rashid Shah), or the Rohri-wara Sayyids, remarkable for nothing but excessive polygamy. Rashid the founder of the house, took unto himself thirty-two wives (instead of four), and justified the practice by the usual sophistical arguments of the Saffi order to which he belonged. The Sindhi divines pronounced his tenets to be heretical, and his conduct damnable. The Mewan sect, however, did not object to it, and still reverence his descendants.

Among hindoos, in general, it is rare to hear of two wives in one house, but the concubinage of cities in the south of India, is facilitated by the temples of the Deva Dasa, women devoted to the gods. In hindoo law, a man may have wives without limit. He ought not, however, to take an additional wife, save under certain justifying circumstances. These are, his wife's exhibiting want of chastity; habitual disobedience or disrespect towards him; bad temper; bad health; barrenness; or should she for a period of ten years produce only daughters. The consent of the hindoo wife, without any disqualifying causes on her side, also, of itself, warrants remarriage. The absence of these justifying causes will not, however, invalidate a second marriage. A wife who has been superseded by a second marriage, whether justifiably or not, should continue to reside with her husband. If he oblige her to leave him, she should reside with his relatives or her own. In either case the husband is bound to maintain her.

It will thus be seen that by the law, a hindoo can marry as many wives, and by custom keep as many concubines as he may choose; the former is allowed by law and custom, the latter however, is not explicitly sanctioned by law, but indirectly permitted by custom, and prevails chiefly among the lower orders. The late maharaja Sevaji of Tanjore married 18 wives on one day, but this was caused by a mere accident. The rajah had sent to his native place for some young women intending to marry one and give the others in marriage to his nobles: but, on their arrival, and becoming aware of his intention they declared that as they came to marry him they would do so or not marry at all, but all would at once destroy themselves. In mythological history, it is stated that the ancient king Dasaradha, the father of Rama, had 60,000 wives. Generally speaking,

hindoo marries only one wife, and after her death, another, if he can afford it. There are a few hindoo persons, in Madras, with two married wives: but it is so extremely rare to find a husband with three or four wives at one time that in all that city of 400,000 people, there were (in 1860) only three instances in the

higher classes, of husbands living with three wives, and these they had married successively, on account of the want of children. Concubinage among the higher ranks of hindoo society in Madras, is not uncommon, and is generally selections from among the dancing girls of pagodas. In the interior, most of the petty rajahs, poligars and zemindars, marry two wives, and sometimes keep concubines at the same time. In the large towns of China and Japan, concubinage seems to prevail to a greater extent, than it is met with in the western countries of Southern Asia. In Japan, the practice, so soon as a woman is married, of staining her teeth black, and thus destroying one of woman's greatest ornaments, can only have the effect of making the wife less attractive to the husband and forcing his affections elsewhere. And in the concubinage of China there is not found among the young women whom they select, any of the deformed feet which the richer classes of the people create for the wives of their households.

Polygamy is not prohibited by the brahminical law but it reserves the privilege of being burnt together with the husband, to the eldest and only lawful wife. Polygamy seems to have been customary in India, in the times of their transition from the pastoral to the agricultural state. Notices of polygamy are more frequently met with in the stories of the hindoo gods than seen among the modern hindoos.

The law of divorce which is enforced among European nations is not applicable to hindoos. According to their religious belief the future beatitude of a man solely depends upon the funeral obsequies performed and oblations offered to the manes by his putra or son, otherwise they consider he will be doomed to purgatory. The primary object of marriage among the hindoos is to obtain a male issue, and it is only in case of failure of a putra or son that the Hindoo law sanctions polygamy, as also under certain other conditions. The Hindoo law, or as may be said, the fountain head of all Hindoo law, the Institutes of Menu, their great lawgiver, sanctions this practice only exceptionally, but not at the mere pleasure or caprice of any man.

"The grounds that justify it regard the wife's conduct, her temper, or her state of health; to which may be added barrenness, or the producing only daughters during a period of ten years."

Throughout the South and East of Asia, women, even as first wives, do not take a favourable position in their households, until they become mothers. Mr. T. T. Meadows writes strongly on the injurious effects on Chinese women which the right to have many wives occasions. The Chinese system differs

seemingly from mahomedan polygamy in this, that a mahomedan woman can legally hold property, is the owner of her own dower, and each wife has a separate establishment and a separate allowance for herself. In China the extent to which wives are, by law and custom, in the power of their husbands, would produce deplorable effects, but for the almost unlimited power which law and opinion give mothers over their sons of every rank and age. So also the institution of polygamy is largely counterbalanced by the desire of all the men to marry early, in order to secure a progeny of sons as soon as possible. The condition of the Chinese woman is most pitiable: suffering, privation, contempt, all kinds of misery and degradation, seize on her in the cradle, and accompany her pitilessly to the tomb. Her very birth is commonly regarded as a humiliation and a disgrace to the family, an evident sign of the malediction of Heaven. If she be not immediately suffocated, she is regarded and treated as a creature radically despicable, and scarcely belonging to the human race. Pan-houi-pan, celebrated among Chinese writers, though a woman, endeavours in her works, to humiliate her own sex, by reminding them continually of the inferior rank they occupy in the creation. "When a son is born," she says "he sleeps upon a bed; he is clothed with robes, and plays with pearls; every one obeys his princely cries. But when a girl is born, she sleeps upon the ground, is merely wrapped up in a cloth, plays with a tile, and is incapable of acting virtuously or viciously. She has nothing to think of but preparing food, making wine, and not vexing her parents." In ancient times, in China, instead of rejoicing when a child was born if it happened to be a girl, they left it for three whole days on a heap of rags on the ground, and the family did not manifest the slightest interest in so insignificant an event. This public and private servitude of women, a servitude that opinion, legislation, manners, have sealed with their triple seal, has become, in some measure, the corner-stone of Chinese society. The young girl lives shut up in the house where she was born, occupied exclusively with the cares of housekeeping, treated by everybody, and especially by her brothers, as a menial, from whom they have a right to demand the lowest and most painful services. The amusements and pleasures of her age are quite unknown to her; her whole education consists in knowing how to use her needle, she neither learns to read nor to write; there exists for her neither school nor house of education; she is condemned to vegetate in the most complete and absolute ignorance, and no one ever thinks of, or troubles himself about her, till the time

arrives when she is to be married. Nay, the idea of her nullity is carried so far, that even in this, the most important and decisive event in the life of a woman, she passes for nothing; the consulting her in any way, or informing her of so much as of the name of her husband would be considered as most superfluous and absurd. In China a woman counts for nothing. The law ignores her existence, or notices her merely to load her with fetters, to complete her servitude, and confirm her legal incapacity. Her husband, or rather her lord and master, can strike her with impunity, starve her, sell her, or, what is worse, let her out for a longer or shorter period, as is a common practice in the province of Tche-kiang. Polygamy aggravates the sufferings of the Chinese wife. When she is no longer young, when she has no children, or none of the male sex, her husband takes a second wife, of whom she becomes in some measure the servant. The household is then the seat of continual war, full of jealousies, animosities, quarrels and not unfrequently of battles. When they are alone they have at least the liberty of weeping in secret over the careless sorrows of their destiny. The little Chinese girl born in a christian family is not murdered, as is often the case among the pagans. Religion is there to watch over her at her birth, to take her lovingly in its arms, and say, here is a child created in the image of God, and predestined, like you, to immortality. The Chinese bride is seldom seen by the husband until she leaves the sedan chair in which she is conveyed, with her belongings, to his house. Mandarin ducks are introduced at marriages as patterns of connubial felicity. In the little feet of the Chinese women, the four small toes appear grown into the foot; the great toe left in its natural position. The fore part of the foot is so tightly bound with strong broad ligatures, that all the growth is forced into height instead of length and breadth, and forms a thick lump at the ankle; the under part measures scarcely four inches long and an inch and a half wide. The foot is constantly bound up in white linen or silk, and strong broad ribbons and stuck in a very high heeled shoe. The crippled fair ones trip about with tolerable quickness; to be sure they waddle like geese, but they manage to get up and down stairs without the help of a stick. Infanticide, of which the husbands are the only perpetrators, is not uncommon; but female children only are murdered, and those immediately after their birth. This horrible crime meets with no punishment from the laws of the country; a father being the sovereign lord of his children, he may extinguish life whenever he perceives, or pretends, that a prolongation of it would only aggravate the sufferings of his offspring.

Polygamy is practised both on the mainland and in Torres Straits and Mr. McGillivray had heard of a man with four wives. According to the will of the father, and without regard to disparity of age, the future husband may be and often is an old man with several wives. When the man thinks proper he takes his wife to live with him without any further ceremony, but before this she has probably associated with the young men, such, if conducted with a moderate degree of secrecy, not being considered as an offence, although if continued after marriage it would be visited by the husband (if powerful enough) upon both the offending parties with the severest punishment. The Abbe Em. Domenech tells us that polygamy prevails amongst the Indians of North America.—*Sinnett's Lady's Voyage*, p. 50; *Bouring's Siam*, Vol. i, p. 105; *McGillivray's Voyage*, Vol. i, p. 8; *P. POLYGALACEÆ, *Lindl.* The Milk-wort tribe of plants comprising 4 genera, 6 species, viz.: 3 Polygala; 1 Salomonina; 1 Xanthophyllum; 1 Securidaca.

POLYGAR, in southern India, in the time of Orme, was a term applied to the semi-independent chiefs in mountainous and woodland districts. Of these were Aryalore, Bangar Yatcham, Bomraz, Coilor-pettah, Elerempenah, Ettapuram, Madura, where their districts lie along the foot of the mountains to the west. Others in Tinnevely, in that neighbourhood were styled the Tondiman rajah, the greater and lesser Moravar; Nattam Nelli Cotah, and Nellitangaville, the last styled Pullitaver. North of Madras are the polygars of Bangar Yatcham, Damerha, and Bomraz, against whom in 1756, Mahomed Ali and Colonel Kilpatrick marched. A polygar possessed the fort of Savanore, one settled at Oodiaghery and another near Verdachelum, when in July 1751, Mr. Pigot and Clive drove off another at Warrior-polliam.—*Orme*, i. See Poligar

POLYGAR DOG, See Canis.

POLYGONACEÆ, *Lindl.* The Buck-wheat tribe of plants, comprising 9 gen. 65 sp. viz.: 1 Konigia; 6 Rumex; 1 Oxyria; 4 Rheum; 2 Coccoleba; 1 Ceratogon; 1 Ampelgonum; 46

POLYGONUM BARBATUM.

Polygonum; **S. Fagopyrum**. Roxburgh names 15 species of *Polygonum*. His *P. lanatum*, common round Calcutta, is called Sweet panee merich, or white water pepper; *P. pilosum*; burra panee merich, or great water pepper, is also common near Calcutta, and flowers at the beginning of the wet season. The name denotes its analogy in properties to the *P. hydropiper* of Europe, which gives a yellow colour to wool; *P. flaccidum* is also called Panee merich in Calcutta. In China, two species of *Polygonum* are cultivated for the blue dye furnished by the leaves, which is extracted like indigo by maceration. In *Icones*, Dr. Wight gives *Polygonum ambiguum*, *aviculare*, *barbatum*, *Chinense*, *donii*, *glabrum*, *horridum*, *Indicum*, *molle*, *Nepalense*, *pedunculare*, *strictum*, *Wallichii*.—*O'Shaughnessy*, p. 523; *Williams' Middle Kingdom*, p. 282; *Wight's Icones*; *Roxb. Vol. ii*, p. 285.

POLYGONUM, sp.

Bijband,	HIND.	Kamin,	HIND.
Kuwar,	"	Hunraz,	"

Used for spitting of blood and rheumatism. A substitute for rhubarb in double doses.—*Powell's Hand-book*, Vol. i, p. 372.

POLYGONUM AMPHIBIUM.

Guree,	CASH.	T'ien liau,	CHIN.
--------	-------	-------------	-------

The root of this Chinese plant has been recommended as a substitute for sarsaparilla, which its root-like stems resemble. Vegetates in Cashmere, and is considered as a veterinary medicine; whence its name, guree (horse).—*Smith's Mat. Med., China*, p. 175; *O'Shaughnessy*, p. 523; *Honigberger*, p. 330.

POLYGONUM AVICULARE.

Wei-jui,	CHIN.	Machooti,	HIND.
Knot grass,	ENG.	Nisomali,	SANS

A plant of China, its dried root is used as a pectoral. Considered medicinal in Behar. Its numerous seeds supply abundant food for small birds; they are said to be emetic and cathartic. Thunberg says that in Japan a blue dye is prepared from this plant. It grows at Cashmere, and is there official.—*O'Shaughnessy*, p. 522; *Beng. Disp.*; *Eng. Cyc.*; *Honigberger*, p. 330; *Smith Chinese Mat. Med.*

This plant grows in Bengal and peninsular India. Considered diuretic at the Cape of Good Hope and given in infusion by the native doctors in India in cases of colic. Cattle eat it greedily. The seeds are used in China also in colic and choleraic affections. Its leaves and stalks as a wash for callous ulcers.—*O'Shaughnessy*, p. 522; *Smith*.

POLYGONUM TORTUOSUM.

POLYGONUM BISTORTA.

Maslan,	HIND.	Anjabar.	PUNJAB.
---------	-------	----------	---------

A plant of N. W. of the India. Root very astringent; useful in sore throat and relaxed gums and ulcers. Ishtapri, a long root, apparently of *Polygonum bistortum*, known from Lahore to Peshawar as "anjabur."

POLYGONUM CYMOSUM, Wall. A wild buckwheat, is abundant at Choongtam in Sikkim, forms an excellent spinach; it is called "Pullopbi;" is a common Himalayan plant, and is also found in the Khasia mountains.—*Hooker's Him. Jour.*, Vol. ii, p. 31.

POLYGONUM FAGOPYRUM, Smith.

Fagopyrum esculentum.	Ugla kaspat,	HIND.
-----------------------	--------------	-------

Seeds nutritive, contain much oil, said to be very fattening.—*Powell's Hand-book*, Vol. i, p. 372.

POLYGONUM HYDROPIPER.

P'en-chuh, CHIN.

A Chinese plant. Juice used as a wash in itching skin affections, as a diuretic, carminative and anthelmintic. The plant is used as a flux in operating on metals.—*Riddell*.

POLYGONUM LINIFOLIUM, as also *Polygonum aviculare* and affinis grow about Lahore, where they are well known, but little used.—*Dr. Honigberger*, p. 330.

POLYGONUM MACROPHYLLUM, grows among the Cashmere mountains, where its roots are official.—*Dr. Honigberger*, p. 330.

POLYGONUM MOLLE, grows on the Cashmere mountains and its roots are official at Cashmere.—*Dr. Honigberger*, p. 330.

POLYGONUM PERSICARIA. The dwarf persicaria, a garden plant, is of easy culture, *P. hydropiper*, a water plant, has beautiful pink flowers.—*Riddell*.

POLYGONUM POLYSTACHYUM, Wall.

Amladandi,	HIND.	Tror,	RAVI.
Chuchli,	"	"	"

This and *P. polymorphum* are tall plants with fine flowers. One at least of them exhaling a strong honey smell at times. Both appear to be common locally in the Punjab Himalaya from 6,000 to 12,000 feet. The young leaves are used by the natives as a pot-herb, and a very good imitation of rhubarb, is got by stewing the stalks, which also, after peeling, are eaten raw by the natives in some places.—*Dr. J. L. Stewart*, M. D.

POLYGONUM TINCTORIUM, also *P. Chinense* and *P. barbatum*, yield a blue dye like indigo, in China and Japan.—*O'Shaughnessy*, p. 523. See Dyes.

POLYGONUM TORTUOSUM, Don.

Niala.	LAD.	Nialo,	PUNJAB.
--------	------	--------	---------

This species, grows to 15,000 feet in the Himalaya, is said to yield a yellow dye in

Lahoul. In Ladak it is browsed by goats and yaks.—*Dr. J. L. Stewart, M. D.*

POLYMNIA ABYSSINICA, Linn. Syn. of *Guizotia oleifera*, DC.

POLYMNIA FRONDOSA, Bruce. Syn. of *Guizotia oleifera*, DC.

POLYNEMUS, a genus of fishes, placed by Cuvier in his third division of the Percidæ, the general form of the body somewhat resembling that of the perch. Considerable interest is attached to the Polynemi on account of their yielding isinglass. This fact was first made known by Dr. Cantor. The species best known, he says is the *Polynemus risua* of Hamilton (*P. longifilis*, Cuvier; the Tupsee, or Mango fish of the Anglo-Indians): this inhabits the Bay of Bengal and the estuaries of the Ganges, but enters the mouths of the rivers even higher up than Calcutta during the breeding season (April and May), when the fish is considered in its highest perfection, and is generally sought as a great delicacy. This species is the smallest, for its length seldom exceeds eight or nine inches, and one inch and a half or two inches in depth." It is remarkable for the great length of filaments, or free rays, of the pectoral fins, these being about twice the length of the body, and seven in number on each side. *P. aureus* and *P. topsui* of Hamilton, Dr. Cantor states, are closely allied to this species. "*Polynemus sele*, Hamilton (*P. plebius*, Broussonet; *P. lineatus*, Lacepede), is the Suleah fish first mentioned in Parbury's 'Oriental Herald,' as yielding isinglass. This species, as well as another closely allied to *P. quadrifilis*, Cuvier, which was dissected, figured and described, under the name of *P. Salliah* (Saccoli), appears to be equally plentiful, in shoals, all the year round, in the estuaries of the Ganges, and is appreciated by Europeans for its excellent flavour: both species attain a size from three to four feet in length, and eight to ten inches in depth," (Cantor.) Besides the species found on the coast of the mainland, two other species of *Polynemus*, *P. hexanemus* and *P. heptadactylus*, have been discovered off the coast of Java. On the coast of Africa and in the West Indies, also, certain species of the present genus are found. One of the African species is confounded by Cuvier with the Indian *P. longifilis*, and the mistake has been rectified by Mr. Bennett. It appears that this species (which is in all probability the *Pentanemus* of Artedion, on which Linnaeus established his *P. quinquarius*) differs from the Mango fish of India in the number of free rays to the pectoral fins, the latter having seven rays, and the African species only five. Messrs. Cuvier and Valenciennes, not having found any species of *Polynemus* with so few as five free rays, and those longer than the body, imagine

that the *P. quinquarius* was founded on a mutilated specimen.

The species of the *Polynemus*, or paradise fish, are known for their excellence as articles of food. Of these the Mango fish or tupsee mutchee of the Bengalees (*Polynemus risua*, Buch.,) is a familiar instance, though this is remarkable as being without a swimming-bladder; while the other species have it large and stout. The species occur in the seas of warm climates; five are described by Dr. Buchanan in his Gangetic fishes, but only two are of considerable size, occurring in the estuary of the Hooghly, and probably in those of the Ganges. One of these, with another large species, is also described by Dr. Russell in his work on the fishes of the Madras coast. That figured in his tab. 184 and called maga-booshee is *Polynemus uronemus* of Cuvier, while the maga-jellce, tab. 183, named *P. tetradactylus* by Shaw is probably *P. teris* of Buchanan. Both, but especially the first, Russell says, are esteemed for the table and called Roeball by the English. Dr. McClelland ascertained that the species affording the isinglass, is the *Polynemus sele* of Buchanan, Sele or sulea of the Bengalee, described but not figured in his work on the Gangetic fishes (p. 226.) Dr. M. has, however, published in the Journal of the Asiatic Society of Bengal, a figure from Dr. Buchanan's unpublished collection of drawings, which are kept at the East India Company's Botanic garden at Calcutta. This figure, he states, conveys a good representation of the Sele, about the half size of a specimen, from which he obtained sixty-six grains of Isinglass. Dr. Buchanan describes the Sele as affording a light nourishing food, like most of the fishes which he has called Bola, but as being inferior to many of them in flavour. It is common in the estuaries of the Ganges, and is often found weighing from twenty to twenty-four pounds; and may perhaps be the Emoi of Otaheiti, the *Polynemus lineatus* of Lacepede, the *P. plebius* of Broussonet. This, according to Block, is by the English called king-fish, and is the Kalamín, TAM., of John, from Tranquebar, and abundant in the Kistna and Godavery. Buchanan further states, that the Sele has a strong resemblance to the abovenamed "maga booshee" of Dr. Russell. An anonymous author stated that from half a pound to three quarters of a pound of isinglass may be obtained from each fish, and McClelland supposed either that *P. sele* attains a much larger size than twenty-four pounds, the limit given to it by Buchanan, or that isinglass is also afforded by a far larger species, namely, *P. tetradactylus*, telia, or teriya shangan. This is identical with the "maga-elle" of the Coromandel coast, and which Buchanan often saw six feet long in the Calcutta bazaar,

and was informed, sometimes equalled 320 pounds avoirdupois in weight. It is considered by the natives as a wholesome diet although seldom used by Europeans. Dr. McClelland says he has frequently seen them of a uniform size, that must have weighed from fifty to a hundred pounds at least, loading whole cavalcades of carts on their way to the Calcutta bazaar during the cold season. Both the Sele and the "teria bhangon" must consequently be very common there from November to March. P. Sele is supposed to be a variety of *P. lineatus*, which is said to be common on all the shores to the eastward; but if so, Dr. M. says, it seems strange that the Chinese should send for it to the Hooghly. The same might, however, be said of the cod, which, though caught in abundance on the coasts of Great Britain, is also diligently sought for on the banks of Newfoundland. He also inquires whether *Polynemus emoi* and *P. plebius*, supposed by Buchanan to correspond with his Sele, contain the same valuable substance, and whether either of Russell's species, the abovenamed maga-booshee and maga-jelle (Indian fishes, 183-184), yield it. The species of this genus, furnish a considerable portion of the isinglass of Southern and Eastern Asia, viz:

Polynemus heptadactylus. Total length 4½ inches. Inhabits Penang, Batavia, Cheribon and Samarang.

Polynemus hexanemus, Cuv. and Val., 4 inches long. Inhabits Penang, Batavia, Samarang and Pasuruan.

Polynemus indicus, Shaw.

P. sele, Buchanan.	P. lineatus, McClelland.
P. uronemus, Cuv., Val.	P. gelatinosus, "
P. ploteus, McClelland.	

Lukwan,	ARRACAN.	Roe-ball,	ENG.
Katha, the young,	BURM.	Ikan kurow,	MALAY.
King fish,	ENG.	Walan kala,	TAM.

The total length of the fish is 3 feet. It inhabits the seas of Penang, Singapore, Malay peninsula, Surabaya, Estuaries of the Ganges, Vizagapatam, Madras and Pondicherry. The structure of the air-vessel of this species is the most striking character by which it may at once be distinguished from *P. plebius*. Its membrane is silvery thick; the general form oval. It occupies the whole length of the stomach terminating behind in a very sharp point, which penetrates the thick of the tail over the first interspinal of the anal. At Penang single individuals occur at all seasons: but numbers are taken from June to August. The weight is commonly from 4 to 6 lb. seldom exceeding 20. The air-vessel of a good sized fish, when dried and ready for the market in China, weighs upwards of 2 oz., is considered very good isinglass, and fetches 25 to 30 dollars per pecul. The fish itself is valued as an article of food, though less so than *P. tetradac-*

tylus. Mr. O'Riley estimated that 2,000 lbs. of isinglass from this fish, might be obtained annually off Amherst alone. Mr. Blundell said that the largest sounds were exported from Rangoon, and that they sell there at about half a rupee a pound. Major Bogle wrote that about 10,000 of the fish, large and small, were taken annually in Arracan and that the sounds sold there for about a third of a rupee per pound: the Chinese exported them to Penang where they are said to bring more than a rupee a pound.

Polynemus plebius, Broussonet; Linne; Bloch; Shaw; Cuv. and Val.

P. lineatus,	Lacepede.	P. commersonii,	Shaw.
P. niloticus,	Shaw.	Bynni,	Bruce.
Roe-ball,	ENG.	Pole kala,	TAM.

This fish attains to 4 feet as its full size. It inhabits the Coromandel coast, Otaheite, Isle of France and Isle of Tanna. Its value as a fish yielding isinglass requires to be ascertained.

Polynemus tetradactylus, Shaw.

P. lineatus,	Gray.	P. quadrifilis,	Cantor.
Triglia asiatica,	Linne.	Maga jelle,	Russell.
P. salliah,	Cantor.		
Roe-ball,	ENG.	Yerra kala,	TAM.

Inhabits seas of Penang, Singapore, Malay peninsula, Lancavy, Bay of Bengal, Gangetic estuaries, Australia, China, Bantam, Batavia, Tjilatjap, Samarang, Surabaya; Bangkallang. The species has no air-vessel.

The true cod has not been seen on the Chinese coast, but several species of *Serranus* (as *Plectropoma susuki*, *Serranus shihpan*, *megachir*, &c.,) generally called shippan by the natives, and garoupa by foreigners, are common about Macao, and considered the most delicate flavoured of any fish in the market. Another a common and delicious fish is the *Polynemus tetradactylus* or bynni-carp, usual called salmon by foreigners: isinglass is prepared from its skin. The pomfret, or stangyu of the Chinese (*Stromateus argenteus*), is a good pan-fish, but not so delicate as the sole-fish, many species of which abound in the shallows of the Bogue. Two or three species of mackerel, the *Sciæna lucida*, an *Ophiocephalus*, the mullet, the white-rice fish and a kind of shad, complete the list of good table fish found in the markets of Canton. Several of the genera *Arius*, *Otolithus*, *Umbrina*, *Lobotes*, *Polynemus*, furnish isinglass in abundance. *P. tetradactylus* is valued both for food and for its large sounds. The isinglass, or fish-glue, made by the Chinese from the sounds and noses of some sorts of fish, as the bynnicarp, or *Polynemus* is much used in cookery, and the manufacture of false pearls. —Royle on Isinglass, *passim*. See *Isinglass*, as *Fish Maws*, *Fish sounds*, or *Air Bladders*; *William's Middle Kingdom*, Vol. ii, pp. 110, 169, 270, 272, 401; *Cantor, Fishes*.

POLYNEMIDÆ, a family of fishes comprising 21 *Polynemus*, 1 *Pentanemus*, 1 *Galeoides*.

POLYNESIA. By modern geographers, Polynesia, in its widest extension, has been understood to include the numerous islands which lie in the Pacific to the east of the Philippines, Moluccas, and Australia, and stretch away to within a few degrees of the west coast of America. So defined, this oceanic region is ethnographically distributed into Melanesia, Micronesia, and Polynesia Proper. Melanesia or the area of the Black, or Papuan, *i. e.* frizzly-haired, population—includes Papua, or New Guinea, the longest island in the world, and all that continuous insular reach south of the equator, from New Ireland to New Caledonia. Micronesia comprises the Pelew islands, the Carolines, the Marianne, or Ladrone, and the Tarawa, or Kingsmill groups. Polynesia Proper, extending eastward from Tarawa to Waiho, or Easter Isle, inclusive, and from Hawaii north to New Zealand south of the equator, comprehends the whole of the intermediate island-world, with the exception perhaps of the Fiji group. Micronesia, or the Pelew-Tarawa region is covered by the brown race, and Melanesia is the area of the black race, and there is the intermediate and ambiguous Fiji islands. Among the inhabitants of Polynesia Proper of the ethnographical legislators, a similarity of race, language, religion, customs, and government, sufficiently attest identity of origin. Ethnologists indeed regard it as clearly established, that the Polynesian Proper are sprung from the Malay family. This bold and enterprising pirate-people, issuing from Sumatra, their primitive settlement, founded Singhapura, A.D. 1160, and about a century afterwards, Malacca. The first arrival of hindoos in the Indian Archipelago, if we may trust Javanese annals, occurred about A.D. 1278. The Malay exodus from the same insular region to Polynesia is conjectured to have taken place "after the hindoo influence began to prevail there, and before the arrival of the mahomedan traders and settlers from Arabia. The presence of the Black or Papuan element in the various islands of Polynesia is explicable on the hypothesis that the Indian Archipelago and Malay Peninsula were primitively inhabited by a dark race, exterminated or absorbed by a brown race of Indians, connected perhaps with the woolly-haired tribes still said to exist "in the mountain range which traverses the eastern side of the Indo-Chinese peninsula." In support of this, or a not dissimilar hypothesis, Professor Latham refers us to a proximately black variety among the existing populations of Protoonesia the Malaccan Peninsula and Indian Archipelago, from whose inferior social position and restriction to

the interior and more impracticable parts of the island, he concludes that the Protoonesian Blacks are the descendants of the older occupants. The population of all the islands of the Pacific, continental group is presumed to date from Oceanian migration, which has been laid down in the following order—Malayan, Protoonesian, Papuan, Polynesian. A well-known writer classes the inhabitants of the Archipelago into two great races, totally different in their physical aspect and in their moral character. He says:—"in the Malay we have the full extent of the Polynesian race (extending from Marianna to Easter Island and from Hawaii to new Zealand) with no greater variety in the Malay language than is to be met with in European languages derived from the same source. The second race are distinguished by the usual Ethiopian features, and occupy New Holland, New Guinea, New Caledonia, and the Fiji. The physical conformation of the Papuan, and particularly the squareness of the head, distinguishes him from the African negro, and authorises the supposition of his being indigenous to these countries.' The writer here quoted assumes the correctness of the proposition 'that one island has supplied another with population based upon the principle of contiguity,' and deduces therefrom that Torres Straits, being the narrowest portion of the ocean which separates Australia from New Guinea, constitutes a reason for deriving the Australian source from the Papuans. It is difficult to define the extent of early occupancy, and to determine where this migration ceased on the continent, since there are physical evidences, as well as other indications of a strong character, which denote that Tasmania and Australia consisted formerly of an undivided terra firma. The Papuan race are clearly either from the Moluccas or an adjoining island, where the negro characteristics are shown to have been more strongly developed than those to be met with around the continent of New Holland; and although the island of New Guinea, from its situation and importance, has enjoyed the advantages of certain civilising influences at a comparatively early period, it has nevertheless retained the strongest features of its settlement throughout a varied intermixture. In the natives of New Guinea we have almost generally the woolly head, sometimes frizzled, and occasionally in pipelike knots, the thick lips and squat noses, which indicate their negro connection, while their colour ranges from the sallow hue of the Sandwich to the dark copper of the Bornese.

The face is suggestive of the Mongol type, being square and angular; and in many parts of the island of New Guinea the obliquity of vision common to the Chinese is apparent. Recent investigations would seem to denote also

that they are frequently distinguished by a Jewish cast of features; so that, instead of their presenting indications of a pure nation, as well as the distinctive type of a great race, there is abundant evidence to the contrary. Coming in all probability from one of the small western islands in the route from the north-west or the Moluccas (originally peopled from the Philippines), the Papuan race are found to spread over a large area, and extend round the Caroline islands. Blakslund states that the geographical boundary of the Papuan is coincident with the north-west monsoon, which is the present one, extending from the equator to 10° or 15° north latitude, and in longitude from Sumatra to the Fiji islands, from which circumstance and their ignorance in navigation the inference is that they have travelled from the west into the Pacific only so far as the prevailing winds allowed. Beyond the Fiji the brown Polynesian race or some intermediate type extends over the Pacific. The descriptions of these latter, agree exactly with the characters of the brown indigenes of Gilolo and Ceram.

Polynesia presents the first appearance of isolation, in the languages of New Guinea, Australia, &c. *i. e.*, the Negrito tongues. The philological evidence of their being akin, either to the Malay or Tamil languages, is at present indefinite and inconclusive. In the Polynesian Islands alone, real dialects of a common tongue do exist, but there the number of words common to such dialects and to the languages of the Archipelago, is so trifling that it refutes at once the notion of a common origin. In Malay, the most familiar words for the head, the shoulder, the face, a limb, a hair or pile, brother, house, elephant, the sun, the day, to speak and to talk, are all Sanskrit. In Javanese, Sanskrit furnishes words for the head, the shoulders, the throat, the hand, the face, father, brother, son, daughter, woman, house, buffalo, elephant, with synonymes for the hog and dog, the sun, the moon, the sea, and a mountain. In the language of Bali, the name for the sun in most familiar use is Sanskrit, and a word of the same language is the only one in use for the numeral ten. It is on the same principle that Mr. Crawford accounts for the existence of a similar class of Malayan words in the Tagala of the Philippine although the whole number of Malayan words does not exceed one-fiftieth part of the language. Head, brain, hand, finger, elbow, hair, feather, child, sea, moon, rain, to speak, to die, to give, to love, are examples. Some personal pronouns are found in the Polynesian dialects, where, in a vocabulary of five thousand words a hundred Malayan terms do not exist. A sentence of Malay can be constructed without the assistance of Javanese words, or of Javanese without the help of

Malay words. These two languages can be written or spoken without the least difficulty, without a word of Sanskrit or Arabic. The Malay and Javanese, although a large proportion of their words be in common, are distinct languages, and their Sanskrit and Arabic elements are extrinsic and unessential. When this test is applied to the Polynesian languages we find an opposite result. A sentence in the Maori and Tahitian can be written in words common to both, and without the help of one word of the Malayan which they contain, just as a sentence of Welsh or Irish can be constructed without the help of Latin, although of this language they contain, at least, as large a proportion of words as the Maori or Tahitian do of Malayan.

Wilhelm von Humboldt is supposed to have established the connexion between the Polynesian languages and the Malay or the language of Malacca, Java and Sumatra; and that this Malay language itself bears the character of the non-Iranian branch of the Japhetic family. Whether the Papua languages, spoken in Australia and New Guinea and by the aborigines of Borneo, of the Peninsula of Malacca and of some small Polynesian islands, be a primitive type of the same stock as the Malay which afterwards in many parts superseded it, is a point that must remain uncertain until we receive a Papua grammar. Asia (with the exception of China and Tibet), the whole of Europe and probably of America and the Polynesian islands (at least in their secondary stock) seem to belong to one great original family, divided into the Iranian and Turanian branches. Bunsen calls this definitively the Japhetic race. In many parts we know that the Turanian race has preceded the Iranian: its language certainly represents an anterior step or preceding degree of development. In some parts we find that the Turanian race succeeded to a still older native element. By the method of examining languages through their grammatic forms rather than by separate words Frederick Schlegel showed the intimate historical connexion between the Sanscrit, the Persian, the Greek, the Roman, and the Germanic languages. In the Polynesian Islands alone, real dialects of a common tongue do exist, but there the number of words common to such dialects, and to the languages of the Archipelago, is so trifling that it refutes at once the notion of a common origin.

Amongst the Indian flora are many temperate genera and species which are common to N. America west of the Rocky mountains, besides many tropical species that are also Malayan and west Polynesian. Polynesians affix a sacred character to a species of the banyan, called by them the *ava tree*.—*Wat-*

POLYPODIUM

ii, p. 227; *Westminster Review*, No. xlii, April 1862, pp. 304-306.

- Polyodon folium*, Lacep., Mississippi, Yang tse kiang.
gladius, Martens, Yang tse kiang.

POLYPE, a class of animals one kind of which produce coral. They are so called because this class of the animal kingdom lives in masses, formed by an aggregation of individuals, called a polypedom; and, in which, there is a central habitation called a polypary, common to all the individuals and where there exists in some respects a community of vitality. The polypary is the stem or central axis and it is covered with a skin or membrane partly gelatinous partly calcareous. It is the coral of commerce. The polypes that make corals are chiefly *Anthipathes glaberrima*, *Madrepora corymbosa*; *M. pocillifera*; *Gorgonia tuberculata*, two species of *Astrea*, *Leiopathes glaberrima* and *L. Lamarckii*. The brain coral is called *Meandrina*. The walls formed by polypi are always perpendicular. When still alive in the sea, the rough surface is seen dotted with red spots, which are the polype or coral insects and a minute examination detects thousands of them, each inhabiting permanently a little cell of its own. Many of the polype or coral insects have a little parasol shaped cover for the head; the arms are furnished with eight claws, are long compared with the body and are generally seen extended as if reaching for food. Some of the kinds of coral resemble gigantic plants with flowers and leaves. Some grow like a tree with leafless branches, and others spread out fan-like, into broad flat surfaces.

POLYPHEMA JACA, Lour. Syn. of *Artocarpus integrifolius*.

POLYPI also Polypiaria, see Polype.

POLYPLECTRON EMPHANUM, see *Pavo japonensis*.

POLYPLECTRON TIBETANUM, see *Pavo japonensis*.

POLYPODIUM a genus of plants of the order polypodiaceæ. The species are

excavatum, Roxb., Molluccas.
glabrum, Roxb., Bengal.
horsfieldii, R. Br., Penang.
lucidum, Roxb., Nepal.
mucronatum, Roxb., Sylhet.
pertusum, Roxb., Soonderbuns.
phyllitidis, Linn., Chittagong.
proliferum, Roxb., Nepal.
semisagittatum, Roxb., Soonderbuns.
sophoroides, Roxb., Molluccas.
tenerum, Roxb., Sylhet.
tridactylum, Wall., Khasya.
wallichii, R. Br., — ?

A large terrestrial Reed fern with hollow stems like a reed, is often used by the natives of Tenasserim instead of quills for pens. In Calcutta, the hindooes boil the young tops of a *Polypodium* with their shrimp curries.—*Mason*; *Hooker*.

POLYPODIUM GIGANTEUM. A tree fern is very rare but is occasionally seen in the southern provinces of Tenasserim resembling a small palm. Griffith found the same species in Assam. The natives have but one name for both the cycas and tree fern.—*Mason*. See Ferns.

POLYPODIUM PERTUSUM, Pitted polypod. In Tenasserim, this fern is often found in company with the preceding species; and may be easily recognized by its creeping habit, and by the margins of the upper parts of its fronds being rolled together when in fructification.—*Mason*.

POLYPODIUM PROLIFERUM, is the only species of fern that the Soane valley presents at one season of the year. The rocks are then elegantly fringed with it.—*Hooker*, *Him. Jour*, Vol. i, p. 50.

POLYPODIUM QUERCIFOLIUM, Oak-leaved polypod. In some parts of the forests of Tenasserim the trunks of almost every tenth tree have a great abundance of this large species of polypod growing upon them. The barren fronds are cordate, and stemless; but the fertile ones stand on long slightly winged stems, and are gashed like the leaves of an English oak.—*Mason*. See Ferns.

POLYPODIUM SEKOUR, grows on the lower range of the hills, near Jowalla mukkee. Its dried roots are white, resembling slices of pears.—*Dr. Honigberger*, p. 330.

POLYPODIUM TAXIFOLIUM.

Wellipanna kelangu, MAL. | Kadehou maa, SANS.

Rheede says that the leaves of this plant, reduced to powder, and taken with honey, are powerful emmenagogues, and bring on abortions. He therefore adds, *Mulieres, ergo, cavete vobis*.—*Hort. Mal.*, par. 12, p. 25; in *Ainslie's Mat. Med.*, p. 134.

POLYPODIUM VULGARE, *Bisfay*. The common fern; it is official at Lahore, whether it is brought from the hills. The Hakims use it to purge away the black bile in melancholy also in

flatulent colic. They think it injurious to the liver. The root is brought to Ajmere from Arabia viâ Bombay: considered heating and given in flatulence and indigestion; not considered poisonous in any quantity: one seer costs four rupees.—*Dr. Honigberger, p. 330; Irvine.*

POLYPORUS, a genus of fungi causing dry rot. Some grow to a very large size, as, for instance, *Polyporus fomentarius*, on poplars near Iskardo, exceeding in dimensions anything which this species exhibits in Europe.

POLYPORUS ANTHELMINTICUS.

Chu-tan, CHIN. | Thau-mo, BURM.
Wa-mo, BURM.

This fungus grows in China, on bamboo. It is about the size of a pullet's egg, it is used as an anthelmintic.—*Smith, p. 175.*

POLYPORUS FRAXINEUS, see *Polyporus meladerma*.

POLYPORUS DESTRUCTOR, see Dry rot.

POLYPORUS FOMENTARIUS, see Fungi.

POLYPORUS IGNIARIUS.

Chi, CHIN. | Ling-chi-ts'au, CHIN.

Many sorts of fungi having some degree of luminosity in the dark, occur in China.—*Smith.*

POLYPORUS MELADERMA, *Sect. Apus*, (*Fries' Syst., p. 359.*)—Its size is remarkable; although not unprecedented, *P. squamosus* has been met with in Scotland with a circumference of 7 feet 5 inches, and weighing 34 lbs. avoirdupois; and *P. fraxineus* has been met with in England measuring the enormous size of 42 inches across: the same dimensions in the Assam species being 35 inches.

POLYSPORA AXILLARIS grows in the same situations, with the *Enkianthus reticulatus*. This plant is very highly prized by the Chinese. It flowers in February and March, about the time of their new year, and then bring the branches down from the hills in great quantities for the decoration of their houses. The flowers are unexpanded when they are gathered, but by being placed in water, they very soon bloom in the houses, and they remain for more than a fortnight as fresh and beautiful as if they had been taken up with their roots in the most careful manner. Even the more beautiful amongst the native orchids are only found at a considerable elevation. The tops of the highest hills are covered in the summer and autumn months with the purple *Arundina sinensis* and the yellow *Spathoglottis fortunei*. The fir (*Pinus sinensis*) is common all along the coast of China; *Cunninghamia sinensis* is rare in Hong-kong, although frequently met with on the mainland; the tallow tree is also indigenous, but no use is made of its fruit. Many kinds of the fig tribe are common, and one, the *Ficus nitida*, a kind of banyan, some-

times forms a very ornamental tree.—*Fortune's Wanderings, pp. 21-2.*

POLYTHEISM. There seem to be three sources from which the ancient Polytheists drew their numerous objects of worship. First, the sun, moon and stars, or host of heaven as they are called by the Hebrew writers, were worshipped by men in the rudest state of society; secondly, the visible works of the Almighty, as reason advanced, gave them an allegorical god of the sea, god of fire, goddess of love; and lastly, in some few cases, the conqueror and law-maker, the scourge and friend of mankind, have been raised to that rank. On the banks of the Nile it was easier, said the Greeks, to find a god than a man. It is not easy to understand the feelings which gave rise to their worship of the cats, dogs, crocodiles, ibises, serpents, and the rest. In some cases perhaps it was the usefulness of the animal, and in some cases its strangeness. Thus the dog and jackal devoured the carcasses which, if left to rot in the streets, might bring disease upon the inhabitants.

In a recent number of 'The Fortnightly Review,' we have a remarkably interesting sketch of the different phases of religious belief in Berar. The writer justly supposes the superstitious and ceremonial rites which obtain in that province, situated as it is in the very heart of India, will afford a fair sample of hinduism as a whole. Although it is true that in certain parts of the country certain forms of worship are more prevalent than in others, as for instance Saivism and Demonolatry characterize the southern portion of the peninsula rather than the northern, yet in the whole country from the Himalaya to Cape Comorin, there is scarcely a district of any extent where each phase of worship has not its representatives. Frequently indeed, the same individual represents in his own practice a philosophic system of worship together with a Feticch cultus, which we might conceive could exist only among the lowest tribes of savages. Thus, in the Madras presidency, the Smarta brahman who professes an eclectic Pantheism, will be certain in almost every instance to be a worshipper of the mystic fossils known in Sanskrit as the Salagram and Banam. These small stones he most jealously guards, and devoutly adores. They have probably been handed down as heir-looms, and have been the household gods of his family for generations, or he has perhaps purchased them but recently for some extravagant sum from a wandering devotee who has brought them from the valley of the Nerbudda. Mr. Lyall gives the following classification of forms of worship existing side by side in Berar:—

The worship of mere stocks and stones and of local configurations, grotesque or unusual.

The worship of things inanimate which are gifted with mysterious motion.

The worship of animals which are feared.

The worship of visible things animate or inanimate, which are directly or indirectly useful and profitable, or which possess any incomprehensible function or property.

The worship of a *Deo*, or spirit, a thing without form, haunting solitary places.

The worship of dead relatives and other deceased persons.

The worship of famous persons at shrines.

The worship of the same as demi-gods or subordinate deities.

The worship of local incarnations

The worship of departmental deities

The worship of the ancient incarnations.

It would be no difficult matter to find instances of each and all of these varied forms of worship within almost any circle of five miles radius in the south of the Madras Presidency. Under the first head, we should find everywhere prevailing the fetich worship of the Salagram and Banam. Under the second head we should first find river worship. In the Tanjore and Trichinopoly districts for instance, certain days are set apart for the special worship of the river Kaveri as a goddess, and offerings of flowers and fruits are thrown into the stream. Under the same head comes the worship of the heavenly bodies, more especially to the sun, 'which rejoiceth as a giant to run his course.' Trees with their branches waving in response to the winds, and sighing mysteriously, are everywhere feared or worshipped. The sacred fig tree is associated with snake worship and adored by barren women, who hope thereby to become fruitful; the tamarind and the utiya are feared as the haunts of devils; while the Tulasi and the Bilva are sacred respectively to Vishnu and Siva. The animal most widely worshipped in the south next to the snake is the monkey. It is allowed to levy black mail with impunity in every bazaar, while whole troops are attached to all large temples, and are daily fed by pious hindooes. The worship of this animal doubtless originated in a superstitious dread of its grotesque resemblance to man—but strange to say, it is now, like the deadly cobra, very generally regarded as a benefactor or bestower of boons, and many a hindoo makes it his patron deity and invokes it on all occasions of danger or difficulty. In the next class we may place the worship of the cow, and the fetich worship of tools. In the Tamil country, one day is especially set apart for the latter worship which is known as Ayuta Puja. The dread of the solitary which leads the superstitious to feel the glen, the forest and the wilderness haunted, and which gives to darkness its horrors, is common to all men; but it seems to reign supreme in India. The small heap of stones on the wide plain, the hanging chain on the weird-looking tree, the rags float-

ing from the bush are signs well known to the hindoo traveller causing him to hasten onwards muttering the charm which on so many previous occasions he has found efficacious. The ghosts of the recently deceased are also much dreaded, even by the highest castes. Brahmins indeed never allow their sick to die within the house, but when they are in articulo mortis, they are carried forth to die in the open air. The spirit of the deceased would otherwise, it is supposed, haunt the house and work harm to the inmates. After every funeral, offerings are paid to the manes. A house in which a suicide or murder has been committed is shut up, and is often allowed to go to ruin, no one being found hardy enough to occupy it from fear of the perturbed spirit. One of the demons most widely feared in the south is the supposed manes of a general of the king of Madura, who in his life time, was noted for his prowess, but who is said to have met with a violent death. There are many villages in the Tanjore, Trichinopoly and Madura districts where shrines are erected to his memory. In Tinnevely an English officer who was killed in 1809 has been canonized, and yearly offerings of arrack and cigars are made at his shrine.

Legends are everywhere plentiful of "the gods having come down in the likeness of men." In many places living men are looked upon as the deity incarnate, and receive divine honours. Till a few months ago, in 1872, a man was worshipped as an incarnation of Siva at the brahmin town of Triviar in the Tanjore district. He wandered about perfectly naked, and without any ostensible means of livelihood. The oldest inhabitant declared that he had not changed in any way during the last sixty years. He was reputed to be at least two hundred years old, and it was thought would never die. He went by the name of Al Kondan or the God-possessed, and there were many superstitious stories afloat of judgment which had overtaken tahsildars and other officials who had vainly endeavoured to seize and punish him as an offender against public decency. A shrine is now erected over his grave, he has been admitted to the highest honours in the local pantheon, and rumour states that he will soon rise again to life. The god worshipped at Trichinopoly under the name of Mathabhuta or Tayumanaver, i. e., he who became a mother, is also a supposed incarnation of Siva who appeared in the form of a mother to aid a solitary woman overtaken by the pains of labour. The temple erected to this incarnation on the Trichinopoly rock is one of the most noteworthy edifices in south India. Of departmental deities, perhaps the most generally adored in the south are Ammai, the goddess of small pox, Laksmi who is supposed

to grant offspring, Kama or Manmatha, the hindoo cupid, Ganessa, the god of learning and of thieves, and Saraswati, the goddess of eloquence.

In many popular observances, the ancient incarnations and personifications of the hindoo scriptures are commemorated and revered. Thus, during thunderstorms, the pious avert the threatening bolt by muttering over the names of the hero Arjuna and invoking his aid. Draupadi the wife of the five Pandava is especially honoured, many shrines being erected to her memory. The anniversaries of the birthdays of Rama and of Krishna are yearly festivals, nearly every incident of their history is in like manner commemorated. Their names are constantly on the lips of the people; a hindoo does not sneeze without immediately afterwards repeating 'Krishna, Krishna!' and whenever he has a few moments leisure he profitably employs it by muttering over the sacred name of Rama. Mr. Lyall remarks, that the beliefs of the people are the reflections of their political and social history throughout many generations, and it is not unreasonable to suppose that as English rule has introduced method, law and order where before were only anarchy, lawlessness, insecurity, and precarious exposure to the caprice of despots, the people will come to have juster notions of what should be the attributes of deity, and they will be less ready to excuse follies, inconsistencies and injustice in their gods, which they would no longer tolerate in an earthly magistrate.

POMACEÆ, *Juss.*, the apple tribe of plants form a tribe of Rosaceæ in the system of De Candolle, but by many botanists they are separated into a distinct family. They mostly inhabit the north temperate zone and the great mountainous range of India. They are chiefly remarkable for their edible fruit when cultivated, abounding in saccharine matter with a pleasant acidity. In a wild state, they are austere or astringent and acid. By distillation of the seeds of some of the Pomaceæ a very little Hydrocyanic acid is obtained. A wild apple, which bears a small austere fruit like the Siberian crab was found in the Bhoota country in East Nepal.—*Royle; Hooker's Him. Journ., Vol. i, p. 205.* See *Eriobotrya japonica*, Loquat, *Pyrus cydonia*.

POMACENTRUS. The gaudiest fish live among the coral reefs, the species of the *Che-todon*, the *Balistæ* and *Glyphosodon*. A *Pomacentrus* is of the richest azure blue: the *Glyphitodon* and *Therapon* are striped and banded.—*Codd.*

POMATORHINUS, a genus of birds of the sub-family Timalinæ. The E. Indian species are

This shrub is common in the warmer parts of the temperate zone. Pomegranates when ripe, are about the size of an orange, are covered with a hard, light brown rind, and contain a reddish, seedy, juicy pulp. The rind of the pomegranate is exported from Bombay to England, where it is used in medicine. In China, dried pomegranates are said to be used for dyeing yellow; the rind is also a tanning substance. The pomegranate is grown throughout southern Asia. In Kandahar, the fruit grows of large size, beautiful red colour, and of great lusciousness. There are six or seven sorts; those of Jelalabad are famous, the husk of the fruit, which is very acrid, and is used in dyeing, and in medicine an astringent: the root bark has similar properties. Dried pomegranates are said to be used in Tunis for dyeing yellow; the rind is also a tanning substance.

Pomegranate peel.

Shih-lui-pi, CHIN.

Used in China as an astringent.

Pomogranate seeds.

POMPHRET, *Stromateus argenteus*.

Vowal meen, TAM. | Hulva mahie, DUK.

The pomfret fish is much valued by Europeans in India. In the Straits Settlements as well as at Madras, *S. argenteus*, *Block.*, is denominated the "white pomfret." In abundance and excellence it vies with *S. sinensis*. At Penang this species is as abundant as the preceding, but probably from its inferior size it is considered somewhat inferior in quality. At the Sandheads it occurs rarely. The various pomfrets, are much valued by Euro-

POMME. *Stromateus niger*, the black pomfret, is taken abundantly along the coasts of India, and is largely dried for export to the interior. *S. sinensis* is, par excellence, the "white pomfret" of the Straits Settlements and Madras, and "pample blanche" of Pondicherry. It is justly renowned for its flavour, but it requires to be used when freshly taken. In the Straits and on the Coromandel Coast it is abundant at all seasons. At the Sandheads in the Bay of Bengal, (21° N. L.) it occurs, but less numerously. Dr. Russell considered it very inferior to the "black" or *Stromateus niger*, Bloch. It is very abundant on the Tavoy coast, and in a smooth sea may be seen deep in the water in great numbers, but they are very shy of the hook. They are considered one of the best fish for the table.—*Russell*, p. 34; *Mason*; *Ains. Mat. Med.*, p. 155.

POMLI, TAM. Woman.

POMME SPINEUSE, FR. Thorn-apple.

POMPONIUS MELA, who wrote *De Situ Orbis*, states that in the furthest east of Asia are the Indians, Seres, and Scythians. The Indians and Scythians occupy the two extremities, the Seres are in the middle.—*Yule Cathay*, Vol. ii, p. 153.

POMPOON, a river near Neema Nowada near Futwah, in the Patna district.

PONASSA, also Tamidalu, TEL. See Natchenny.

PONA-VERI, TAM. *Cassia sophora*, Linn.

PONATOO, TAM., SINGH. The germinating seeds of the palmyra, are boiled and eaten in Ceylon as a vegetable.

PONCHA, HIND. Ankle ornaments for children.

PONDA, HIND. *Saccharum violaceum*.

PONDICHERRY, on the Coromandel Coast, the chief town of the French possessions in India, and residence of the Governor General, is in lat. 11° 56' N., long. 79° 54' E. Pondicherry was founded by Mantin in 1674, and afterwards became the seat of the French Government in India, but it afterwards fell in 1760, and with it the dominions of the French in India. Pondicherry was taken by Colonel Coote on the 14th January 1760, after a prolonged defence. All its defences were razed to

the ground. Pondicherry was captured on the 15th January 1776. The area of the French establishments in India comprises 50,950 hectares divided as follows: Pondicherry 29,122; Karikal 13,515; Mahe 5,909; Yanoun 1,439; Chandernagore 940, and the eight plots of ground belonging to the French at Masulipatam, Calicut, Surat, Balasore, Dacca, Cassambazar, Joogdi and Patna comprise twenty-five hectares. According to statistical tables drawn up in 1868, the land under cultivation amounts to 35,716 hectares. The land which though capable of cultivation but which is still untouched amounted to 15,234, while ten thousand hectares are reckoned to be unfitted for cultivation. Pondicherry consists of three districts, that of Pondicherry is composed of the town and eleven villages, that of Villanor having forty-five villages and that of Babour, thirty-six. The most important streams that run through the territory of Pondicherry are Gingy which is fed by the Arincoupom and the Chonnambar rivers and the other is the Ponnear. Karikal is divided into five districts, viz., Karikal, Tirnoular, Nellajandour, Nedouncaudo and Kotchery. They comprise one hundred and seven villages. Within the French territories nine new canals and fifty tanks, some of which are very large, have been constructed within the last few years.

PONDIGUL SLATE, a dark black monumental marble, is procurable in any quantity at the village of Pondigul, distant from Masulipatam about 70 miles, and from Hyderabad about 90 miles, situated on the Guntoor side of the river Kistnah, and in the Guntoor district. Slabs from 5½ feet by 3 feet and from 2 inches thick are to be had at but little cost and labour, and there are good bandy roads in most directions, but the cheaper and more feasible mode of conveyance would be, on flat-bottomed boats or rafts down the Kistnah to Masulipatam, from whence it could be shipped to all parts.—*Mr. J. S. Stricke*, *Kimedy*, 9th August 1850.

PONERIDÆ, Smith., a family of insects of the order Hymenoptera, comprising the genera *odontomachus*, Latr. *typhlopode*, Westw. *myrmica*, Latr. *ponera*, Latr. *crematogaster*, Latr. *pseudomyrma*, Gure. *atta*, St. Farg. *phaidole*, Westw. *meranoplus*, Smith. *cataulacus*, Smith.

In the genus *Ponera* the neuters and females are armed with a sting. The peduncle of the abdomen is formed of a single knot; antennæ in these individuals thickened at the tip; mandibles triangular; head subtriangular.

Dr. Jerdon has described:—

P. sculpta.
P. stenochelios.
P. atinis.

P. rufipes.
P. pumila.
P. processionalis.

—Jerdon.

PONG, see Maha radza weng.

PONG, TAM., MALR. *Pongamia glabra*, it grows to about eighteen inches in diameter, and twenty feet in height, and spreads its branches to a great extent. The native carpenters prefer this very heavy and remarkably strong wood for the knees of vessels, and also for general uses where strength is required. The trunk of the tree is applied to the uses of the block-maker, for shivers, blocks, &c.—*Edye's Mal. and Can.*

PONGA of Rheede, MAL. ? *Pongamia glabra*.

PONGA, —? *Dalbergia frondosa*.

PONGAH, TAM. ? A Travancore wood of a brown colour, specific gravity 0.988. Used for building houses.—*Colonel Frith*.

PONGAL, the 1st day of the Tamil year, a Tamil feast day of the 12th January when the sun enters Capricorn, the greatest of the unsectarian festivals of the hindoos. The Pongal is nothing else but the pagan feast for the birth of Mithras. The last presents the allegory of the regeneration of the sun; and that of Pongal is for the return of this planet. The renewal of the solar year has been always celebrated with great solemnity among all nations. Mr. Garrett in his Classical Dictionary says the Pongal is the greatest of the unsectarian festivals of the hindoos. It is celebrated at their astronomical new year when the sun enters Capricorn about the 11th January, and lasts three days; during which the hindoos employ themselves in mutual visits and compliments, something in the same manner as the Europeans do on the first day of the year. The feast of the Pongal is a season of rejoicing for two special reasons. The first is, that the month of Magha, *i. e.*, December—January, every day in which is unlucky, is now over; and the other, that it is succeeded by a month, each day of which is lucky. For the purpose of averting the evil effect of the baleful month of Magha, about four o'clock in the morning, a sort of Sannyasi, *i. e.*, penitents, go from door to door of every house, beating on a plate of iron or copper which produces a piercing sound. All who sleep, being thus roused, are counselled to take wise precautions, and to guard against the evil presages of the month, by expiatory offerings, and sacrifices to Siva, who presides over it. With this view, every morning, the women scour a space of about two feet square before the door of the house, upon which they draw several white lines with flowers; and upon these they place several little balls of cowdung, sticking in each a citron blossom. These little balls are probably designed to represent

Vighnesvara, the remover of obstacles whom they desire to propitiate with the flower. Each day these little lumps of cowdung, with their flowers, are picked up and preserved in a private place, till the last day of the month Magha; and when that comes, the women, who are alone charged with this ceremony, put the whole in a basket, and march from the house, with musical instruments before them, clapping their hands, till they reach some waste place where they dispose of the relics. Then, with the first day of the new month begins the festival, the first day of which is called the Bhogi Pongal, *i. e.*, Indra's Pongal, and it is kept by inviting the near relations to an entertainment, which passes off with hilarity and mirth. The second day is called Surya Pongal, *i. e.*, Pongal of the sun, because it is set apart in honour of the sun. Married women, after purifying themselves by bathing, which they perform by plunging into the water without taking off their clothes, and coming out all wet, set about boiling rice with milk, in the open air, and not under any cover; and when it begins to simmer, they make a loud cry, all at once, repeating the words, Pongal! Pongal! The vessel is then lifted off the fire, and set before the idol of Vighnesvara, which is placed close by, and after having been offered to the image, part of the rice is given to the cow; and the remainder distributed among the people. This is the great day of visits among the hindoos. The salutation begins with the question, "has the milk boiled?" to which the answer is, "it has boiled;" and from this festival takes its name "Pongal," *i. e.*, "boiling." The third day is called the Pongal of cows. On it they mix in a great vessel filled with water, some saffron, cotton seeds, and leaves of the margosa tree; and then going several times round all the cows and oxen belonging to the house, they sprinkle them with the water, as they turn to the four cardinal points; and make the *Hashtanga*, or prostration of the eight members, before them four times. This ceremony is performed by the men only. Next the cows are all dressed out, their horns being painted with various colours, and garlands of flowers and foliage put round their necks and over their backs. They likewise add strings of cocoanuts and other fruits, which are soon shaken off by the brisk motion of the animals, which these trappings occasion, and are picked up by children and others, who follow the cattle on purpose, and greedily eat what they gather, as something sacred. The cattle then, being driven in herds through the villages, and made to scamper about from side to side by the jarring noise of many sounding instruments,

are, during the remainder of the day, allowed to feed at large without a keeper; and whatever trespass they commit are suffered to pass without notice or restraint. At the conclusion of the festival they take the idols from the temples, and carry them in pomp to the place where the cattle have been collected. The singing girls of the temple, named Devadasi, who are found ceremonies are also not wanting here.

No particular god presides upon the occasion, although nominally the feast is in honour of Indra through whose means the paddy grew, and ripened till it become fit for food. On the eve of the celebration of the festival houses are cleaned, broken roofs are repaired, the rude external decorations of the walls are painted afresh, and the sacred signs of the Vishnuvites are carefully picked out above the threshold. The potter plies his wheel incessantly, for every hindoo house must be furnished with new utensils. The rice-man is busy with cadjan and style, buying up new grain from needy cultivators, for in every house new rice only may be used. Parents, who, during the past year, have given a daughter in marriage, and seen her settled in her new house, send her large quantities of grain, fruits, and household stuffs, that the Pongol may be kept without touching the small capital of the young couple. Though the feast professedly extends over seven days, the first four only are of importance. The first is termed Bhogi Pongol, or Indra Pongol, that is the Pongol of Indra and joy, i. e., "may Indra, the lord of sky and of rain, give us joy." In the spirit of such words the day is devoted to visiting and hospitality. The second is the great day of the feast, and is called the great Pongol, and the Pongol of the sun. In explaining the details of the ceremonies of this day, it may be well to remember that the word Pongol signifies "boiling." The deity, invoked is the sun, but practically Pulliar Swami or the Belly God is master of the ceremonies. A square of ground in the yard of the house is consecrated with cow-dung, and a ball of the same holy material is set up to represent the deity, and to him incense is burned and invocations are offered. But the grand consecrating power of the scene resides in the new cooking pots and their contents. New rice must be used, and it is mixed with milk, sugar, green gram, and other niceties for the palate. The process of cooking is watched with great interest, and when the snowy froth rises to the surface, the house resounds with the cry "Pongol, O Pongol, it boils, it boils." This operation must be performed in the open air, and is a thank-offering to the sun, by whose power the grain has grown and ripened for the use of men. This rice is then presented to the

cow-dung deity, a portion of it is given to the cows of the family, and then the feast begins, and friends and relatives and servants take part in the festive proceedings. In the evening in their best attire the people proceed on a round of calls. They salute one another with the grave inquiry "has it boiled?" and receive the answer, "it is boiled?" Chat and music follow, every form of hindoo amusement is put in requisition, and the festivity is often prolonged far into the night. The third day is called Madu Pongol or the Pongol of cattle. These animals, so useful in the agriculture of the East, are treated to a gala day. They are washed and rubbed down; their horns are gilded or painted; garlands of fruits and flowers are suspended from their necks; incense, prayers and handfuls of Pongol rice are presented to them. They are then loosed from their stall and are driven forth with drums and horn, and are allowed at will to wander over pasture or plain; and after a time they are driven home to the drudgery of another year. The fourth day is called Cunnool Pongol, or Pongol of calves. On this day all that was done to the cows and bullocks on the previous day falls to the lot of the calves.—*Sommerat's Voyage*, p. 143; *Mudras Newspaper* quoting *Garrett's Classical Dictionary*; *Abbe Dubois*.

PONGAMIA, a genus of plants, mostly trees, of the order Fabaceæ, section Dalbergiæ; the following East Indian species are known:

glabra, Vent., British India, Burmah.
marginata, Grah., Khasya.
uliginosa, DC., Pen. India, Pen. Malacca, Beng.
sericea, Vent., Java.
heterocarpa, Wall., Burmah.

Papree, paphri	KUMAON.	Pongam, Punga,	TAM.
Kurunj,	MAHR.	Kanuga,	TEL.
Pongam,	MALAB.	Kranuga, Kaggera,	

This graceful tree grows all over India and

in the two peninsulas, attaining a height of 40 to 50 feet. It grows in Kumaon in swamps and low lands. In good soil it attains a large size, and has beautifully varnished green leaves all the year round. It is very common in southern India, generally on the banks of streams but also flourishing equally well in the arid plains of the Carnatic and on the sub-alpine tracts of Mysore. It is common on the Bombay side, in forests, chiefly, near and under the ghats, and will generally be found skirting streams, its wood is white and firm and is used by the natives. In Ganjam and Gumsur, its extreme height is 36 feet, circumference $4\frac{1}{2}$ feet, and height from the ground to the intersection of the first branch 22 feet. The tree is very common there, but seems to be used only for firewood. It is excellent for avenues; the oil extracted from the fruit is used medicinally for itch and other cutaneous diseases and is also employed as lamp oil. In Coimbatore, the wood is said to be only fit for fuel, though Dr. Roxburgh states that it is light and white and serves for a variety of purposes. Dr. Gibson thinks it may be of some use for household purposes. The boughs and leaves are extensively used as a strong manure, for sugar-cane especially. The bitter oil is much used on the Bombay side in the manufacture of native felt, and has great curative powers in itch and mange. The seeds yield an oil called Karanj oil, which solidifies at 55° . This oil is of a pale brownish colour, has a slight smell, which becomes more evident in the darker coloured samples than in the pale sherry coloured. The seed is bean-shaped, and produced in a flat pod: the pods grow several together. The flower is pink and white of the shape of a bean-flower or blossom. The oil is used for burning in native lamps and in large quantities for boiling with dammer to soften it for the seams and bottom of ships. It is also often used by native practitioners for the cure of itch. A maund of seeds costs 1 Rupee 8 annas, and the extraction of the oil by heat costs 8 annas: the oil produced amounts to $6\frac{1}{2}$ seers per maund.—*Drs. Wight, Voigt, Gibson and Cleghorn; Simmond's Com. Prod.; Captain Macdonald; Mr. Latham; Captain Beddome, p. 23; M. E. J. R.; Mr. Thompson; Powell's Hand-book, Vol. i, p. 343.*

PONGAMIA, Species, Brandis.

Thinwin, BURM.

Not uncommon in the dry forests, in the plains, and on the hills of British Burmah. The heart wood, which is black and tough but rather small, is used there for the cross pieces of arrows, the teeth being made of Sha (*Acacia catechu*), Myoukkhyau, (*Blackwellia tomentosa*), and Gyo (*Schleichera trijuga*). A cubic foot weighs 60 lbs. In a full grown tree on

good soil the average length of the trunk to the first branch is 20 feet and average girth measured at 6 feet from the ground is 6 feet. It sells at 12 annas per cubic foot.—*Dr. Brandis; Cal. Cat. Ex., 1862.*

PONGAMIA, Species, Brandis.

Thit-pa-gan, BURM.

A soft wood of British Burmah, said to be useless. In a full-grown tree on good soil the average length of the trunk to the first branch is 40 feet and average girth measured at 6 feet from the ground is 9 feet. It sells at 4 annas per cubic foot.—*Dr. Brandis; Cal. Cat. Ex., 1862.*

PONGANA, or Minari—? *Pongamia glabra.*

PONGELION—? *Ailanthus malabaricus.*

PONGHU, TAM.?? In Travancore, a wood of a brown colour; specific gravity 0.960, 3 feet in circumference, used for building.—*Col. Frith.*

PONGHUJ, BENG. *Nelumbium speciosum, Willd.*

PONGKANATU WANLOO. TEL. Barber.

PONGO—? See Simiadæ.

PONGOLAM, MALEAL. *Putranjiva roxburghii, Wall.*

PONI, TAM. *Felis catus, the Cat.*

PONI-AMMA, one of the Amman gods of S. India, meaning gold-mother.

PONNA MARM, MALEAL., and Pune marm, TAM. *Calophyllum inophyllum.*

PONNAM, in Malabar. See Kumari.

PONNAM-TAGERA. *Cassia sophora.*

PONNANG COTE, TAM. *Sapindus emarginatus.*

PONNA PU, TEL. *Calophyllum inophyllum.*

PONNE TREE OIL, ANGLO-TAM. Oil of *Pongamia glabra.*

PONNU, TAM. Gold.

PONNUKU, TEL. *Gyrocarpus asiaticus, Willd.*

PON-PADRIA MARAM, TAM. *Bignonia chelonoides.*

PONPATHERA, TAM. In Tinnevely, wood of a whitey brown colour; specific gravity 0.683. Used for building purposes.—*Col. Frith.*

PON-PO, see Swastika.

PONPOSO KOMAREE, URIA? A tree in Ganjam and Gumsur, extreme height 30 feet, circumference 2 feet, and height from the ground to the intersection of the first branch, 8 feet.—*Captain Macdonald.*

PONT, Punt, CHIN. A linear measure,

the tenth part of the ovid, equal to nearly 1½ inch.—*Simmonds' Dict.*

PONTA LETSHI, MALAL. Syn. of *Lawsonia alba*, Lam.

PONTERA, a genus of the Pontederacæ.

PONTERA DILATATA. This large species is found in the neighbourhood of Rangoon, and may exist in the Tenasserim provinces.—*Mason.*

PONTERA VAGINALIS, Linn., Roxb.

Nouka,	BENG.	Niru kancha,	TEL.
Kirim gala,	MALAL.	Niru kacha,	"

This perennial plant grows in moist places in Bengal and peninsular India. It is used in medicine. The margins of many wild jungle streams in Tenasserim, are pimpled with this small species of the pontedera,

"A bonnie wee flower a'wild in the wuds,
Like a wee twinkling star high up in the cluds,
Which opens its cups sealed up in the dew,
And spreads out its leaves of a beautiful blue."—*Mason.*

PONTONIA, see *Palemonidæ*.

PONTOPHILUS, a genus of shrimps. the Egeon, of *Risso*.

PONTUS and Cappadocia in Asia Minor: their original inhabitants were the Lud or Ludi, as far as the Halys, where the historical Lydians were seated. The Lud or Ludi were a Semitic race. See Lud or Ludi.

PONUKE GADDI, TEL. *Thyridstachyum perforatum*, Nees.—*Rottbollia* per. R. i, 356, Cor. 182.

PONUKE, or Kummara ponuku, TEL. *Gyrocarpus asiaticus*, Wild.—G. jacquini, B. 678. R. i, 445; Cor.

PONWAR, HIND. *Cassia occidentalis* and C. tora.

POOAH, or Poe, fibre, is the Kienki, of the Lepchi: and the Yenki by the Lomboo. It is the *Boehmeria frutescens*, grows to the height of six or eight feet: and the fibre when properly dressed, is quite equal to the best flax of Europe, being used for fishing nets, game bags, twine and ropes, is considered well adapted for making cloth and canvas, has great strength and endures wet well. Occurs near Simla. Pooah fibre, or Pooah hemp is called "Pooah" also by the Parbutia. It is not cultivated, but grows wild and abundantly in the valleys throughout the mountains of Eastern Nepal and Sikkim, at the foot of the hills striking the tarai to the elevation of 1,000 or 1,200 feet and within the mountains up to 3,000 feet. Dr. Falconer recognised this plant, as common from Gurhwal to the Sikkim hills; from the Ganges to Burrampooter. In the outer hills of Gurhwal Kumaon it is called Poe. It does not grow in the forest but is chiefly found in open clear places, and in some situations overruns the abandoned fields of the hill people, within the elevations which suit it.

POOJA WIPOO

It sheds its leaves in the winter; throws them out in April and May; and flowers and seeds in August and September. The exact period altering of necessity with the elevation.—*Royle*, p. 368; *Simmonds' Dict.* See *Boehmeria*, Fibrous Plants.

POODEENA, HIND. *Mentha verticulata*, M. viridis. Mint.

POO-ARASOO, CAN. *Thespesia populnea*, Lam.

POOCHAY-COTTA-MARAM, TAM. *Sapindus emarginatus*.

POODALUM, TAM. *Trichosanthes anguina*.

POODOOCOTTA, a small independent chieftainship, in the Madura collectorate, its chief being styled the Rajah Tondaman-Bahadoor. See Jalicut.

POODINA, BENG., HIND. Mint, *Mentha viridis*.

POODY VAGA, TAM. ? A Travancore wood of a brown colour, specific gravity 0.400, 4 to 10 feet in circumference, 40 feet long; strong, never splits; used by wheelwrights.—*Colonel Frith*.

POOG, BENG., HIND. *Artocarpus integrifolia* ? also *Areca catechu*.

POOI, BENG., HIND., also Poo-in-shak or Pootika, BENG. *Basella cordifolia*.

POOJA WIPOO, a ceremony celebrated with splendour in Trevandrum. Coomarasamy (the son of Siva), who was kept at Coomara Coil near Puttinanabapuram, is brought to Trevandrum for the celebration of the Dassara feast. It costs the Sirkar 3,000 fanams annually in cash exclusive of his travelling expenses. The god is supposed to receive these 3,000 fanams, in consideration of the difficult task he has to perform in crossing the three great rivers, Neyour of Neyatencuray, Tambrapoorni of Cooliteray, and the Caramanayaur of Trevandrum. This deity, having lost caste, because he married a girl of the Coorava caste by name Vulley, and one of the Parava caste by name Thavayanay, is not allowed entrance inside Padhmanabaswamy pagoda, but is made to reside in a pagoda outside the fort near Chalay called Ariya Chalay. After the close of the ceremony, for the celebration of which his presence is invited, the god receives the fee of three thousand fanams, and is taken back to his pagoda at Padhmanabapuram, escorted by a company of the Nair brigade, a good number of pagoda girls, the tahsildar, and some petty officials, and is not disturbed till the next feast. Dancing girls, belonging to many of the pagodas in South Travancore, also grace the occasion with their agreeable presence and remarkable dancing, creating during their short stay of ten days, a great deal of disturbance by their immoral and obscene conduct, and thereby giving

a good deal of trouble to the Police authorities. On the day that this ceremony closes. His Highness the Maharaja proceeds in his royal car to Poojeperah.

POOJA, SANS. Worship. From pooja, to honour or serve.

POOJAKA, SANS. A worshipper.

POOLA, HIND? *Phyllanthus multiflorus*, also *Bombax malabarica*.

POOLCHI PALLAM, TAM. *Antidesma acida*, Linn.

POOLEE-YAREELAH—? *Oxalis corniculata*.

POOLEJ, see Khiraj.

POOLIARAY —? *Oxalis corniculata*.

POOLI, TAM. Tamarind. *Tamarindus indica*.

POOL-I-SIRAT, PERS., the bridge between Heaven and Hell.

POOLOOC-ODIAL, SINGH. A name in Ceylon for the young shoots of the palmyrah palm boiled, when eaten raw, they are termed odial; but are also called Kelingoo or roots. —*Simmond's Dict.*

POOLYETTY, TAM. ? A Travancore wood of a black colour, specific gravity 0.858, 2 to 8 feet in circumference; a strong wood used for furniture. —*Colonel Frith*.

POOLYMUNGU, TAM., of Madras. *Hibiscus cannabinus*, Linn., Roxb., *W. & A.*

POOMPLEMOOS, MALAY. *Citrus decumana*, Linn., *W. & A.*, Roxb. The Shaddock.

POON or Peon, MALAY., a commercial term, derived from the Malay language but applied to the timber of several distinct trees, used for masts and spars. The *Calysaccion angustifolia*, which grows in Canara and Sunda, in ravines of the ghauts and below in sheltered valleys—is used for "Poon" spars, and ought to be conserved everywhere and largely increased. Another of the supposed Poon spar trees, is the *Calophyllum inophyllum*, Linn., Roxb.; a beautiful tree, which grows in the western part of Ceylon, where it is employed for the masts and cross sticks of Yettadonies and fishing boats and poles of bullock carts. A cubic foot of it, there, weighs 40 lbs. Dr. Wight says; that this tree is rare in Coimbatore, and that the wood is coarse-grained, but very strong and durable, and on the coast is used in ship-building. In the alpine forests, it attains a great size and furnishes the poon spars so valuable for shipping; but, so far as he could learn, there are two or three species of *Calophyllum* used for the same purpose under the general name of poon. It grows well in sandy tracts close to the sea, where few others thrive. Drs. Gibson and Cleghorn are of opinion that the Poon spars of commerce, are obtained from the *Calophyllum angustifolium*, and their decision is of

great weight. Dr. Gibson's words are, that to the best of his knowledge, Poon spars are furnished by *Calophyllum angustifolium*, which is a magnificent tree in the ravines of the southern ghauts. Major Drury who long resided in Travancore, does not in his "Useful plants," name the *Calophyllum inophyllum* (Ponna, MALEAL and TEL.: Pinnay, TAM.) as furnishing any of the Poon spars of commerce, but he adds that one kind of East Indian Tacamahaca is produced by *Calophyllum inophyllum*, though *C. calaba* and *C. tacamahaca* also furnish other kinds of Tacamahaca wood. Also, in 1850, in the proceedings of the Madras Central Committee, for the Exhibition of 1851, the Poon of commerce was supposed by Dr. Wight to be from the *Dillenia pentagyna*, "Rowadan," TEL., a large timber tree, a native of the Northern Circars; which flowers in March and April. The similarity of native names between this and *Calophyllum inophyllum* led Dr. Wight to suspect that some mistake had arisen. He observes that the wood of *Dillenia pentagyna* is said to be exceedingly strong and very durable, even when buried under ground, and, it is a stately forest tree, common on the face of the W. ghauts. Dr. Wight was, at that time, satisfied that *D. pentagyna* is the tree which furnishes the Poon spars, being a tall, and *Calophyllum inophyllum* a short, stunted, tree. At the Madras Exhibition of 1855, Dr. Cleghorn in the Jury Reports, noticing *Sterculia foetida*, Pinari maram, TAM., Guruppu badam chettu, TEL., as a large tree in Mysore and on the western coast of the peninsula, adds that it is one of the trees believed to furnish the smaller Poon spars, and Major Drury, in *Useful Plants*, repeats that it furnished some of the masts known as Poon spars. Until botanical inquirers who visit the forests finally determine the trees which furnish all the Poon woods of commerce, it would be useless to pursue the subject further, here. The tendency of the evidence, therefore, is to establish *Calophyllum angustifolia*, *C. inophyllum*, *Calysaccion angustifolia*, *Dillenia pentagyna* and *Sterculia foetida*, as trees which produce Poon woods of commerce. The Bintangor wood of Penang, Malacca and Singapore, seems, also, to be the *Calophyllum angustifolia*, and, Dr. Cleghorn, in his forest reports seems to have no doubt that *C. angustifolia*, produces the Poon of Coorg, Mysore and Canara, where, he says, the trees are becoming very scarce, and the timber is consequently more valuable than teak. He enjoins their strictest conservation. In a special report on Poon spars, Dr. Cleghorn mentions that these are supplied entirely from Canara and Coorg. He tells us that in the ghats of Coorg and Malabar, the best timber has been cut away and the wood contractor is felling in more remote localities.

Teak, blackwood and Poon spars are every year becoming more scarce in accessible localities. There may, however, have arisen some of all this doubt, from several trees having similar Tamil and Malealum names. Thus, Poongum maram, TAM. Poongana, MALEAL, is the *Pongamia glabra*. Ponna, is the MALEAL, Pinnay maram, TAM. ? Poonnay maram, TAM., of *Calophyllum inophyllum*. Pinnari, TAM., *Sterculia foetida*, and Pinnay maram, TAM., *Dillenia pentagyna*.

Poon wood, as imported from the East Indies, into Britain, very nearly resembles a dull coloured and greyish specimen of mahogany, and would be useful for any purpose to which such kind of mahogany is applicable; besides having a greater degree of strength and stiffness compared with its weight. The Poon-wood, or Peon-wood of Singapore is of a light porous texture, and light greyish cedar colour; it is there used in ship building for planks and make excellent spars. Dr. Roxburgh says, *Calophyllum angustifolium*, is a native of Penang and of countries eastward of the Bay of Bengal, and yields the straight spars commonly called Poon, which in those countries are used for the masts of ships. Tredgold says its texture is porous, but uniform; and the mean weight of a cubic foot in the dry state is 405 lbs. The cohesive force of Poon is from 10,000 to 14,700 lbs. per square inch, the mean weight of the modulus of elasticity for bars of an inch square is 1,689,800 lbs. The specific gravity, and the relative strength, stiffness, and resilient power compared with Riga fir, as 1,000, from Mr. Fincham's experiments are, as under:—

Specific gravity.	Strength	Stiffness.	Resilience.	
579	1380	1270	1400	Barlow.
647	1226	1230	1146	Fincham.
613	1303	1250	1273	Mean of both.

From whence it appears that it is superior to Riga fir in the properties required for mast wood. Colonel Frith noticing a Poon in Travancore, says it is of a brown colour, specific gravity 0.623, 2 to 4 feet in circumference and 80 feet long and there used for masts. Poon is used for the decks, masts and yards of ships, and it appears to be well adapted for these purposes, both by its strength and lightness.

Mr. Edye, writing on the Poon spars generally, says that the light-red peon from the forests of Coromandel and Mysore, which can be procured at the port of Mangalore, on the Malabar coast, is considered the best of the growth of India, for the general purposes of lower masts, top-masts, and yards. The poon masts, as to strength, compared with Riga, &c., spars for masts, are superior to any; the weight of those of the proper sort is about the same

as Riga fir, and their durability is very great; a set of lower masts would probably last for fifteen or twenty years. Mr. Edye, while in Canara, Malabar and Ceylon, thus described the following kinds of Poon, viz.:—

Cheru-puna in Tamil and Malayala, which is the small-leaf peon. Cheru in Tamil means bastard. This wood is the real mast peon, which is preferred for the masts of ships or vessels, Peon, or Puna, he says, consists of five sorts, all of which are similar in shape and growth; (a) the largest sort is of a light bright colour, and may be had at Mangalore, from the forests of Corumcul, in Canara, where it grows to a length of one hundred and fifty feet. At Mangalore, he procured a tree of this sort that would have made a foremast for the *Leander*, sixty gun ship, in one piece, for the sum of 1,300 rupees, or 149£ sterling. Poon, he adds, grows in the forests of Cochin and Travancore, but it is of a very inferior quality to that before stated; (b) one sort is named the *Karapa puna*, which is dark peon: (c) another, *Mallai puna*, meaning the hill peon; and another sort, (d) the *Vallai puna*, or the white peon, this sort is small, not more than twelve or eighteen inches in diameter, and eighteen or twenty feet long. In Canara, another sort, (e) named *Merchie puna*, grows to twenty-eight inches, or three feet in diameter, and from thirty to fifty feet long; and is much like the American birch. It is generally defective and not durable, consequently it is never brought from the hills, for, when felled, it opens and splits at the top and butt for many feet in length. The weight of the peon may be said to be from forty to forty-eight pounds the cubic foot; but the lightest he had met with was thirty-four and three-quarters, and the heaviest fifty pounds, the cubic foot, when dry. The leaf of this tree is small and oval, about two by one and a half inches broad, and the fruit grows in bunches, it is about the size of coffee-berries; from this the natives extract oil, which is used for various native purposes. (Note—*Cheru* means bastard.)

Puna, in Ceylon, is, he adds, the wood commonly called Peon in England. It is used for masts, yards, &c. This is the wood so much spoken of by persons from Ceylon, and it certainly is of a good quality, and superior to that of Malabar: but, from its small dimensions, its scarcity, and the trouble in obtaining it, is of little consideration. The largest said to have been found was eighteen inches in diameter, and sixty feet in height; but the largest Edye could discover was not more than nine inches in diameter, and thirty-five feet high. In quality it is much the same as the first sort in Malabar, which may be obtained at Mangalore from the native merchants at all the times when the coast is open (viz. from November to April) of

three feet in diameter, and one hundred and ten feet long, for the sum of 150£ sterling.

Vellie puna, a Malabar and Canara tree, known in Malabar as the white or kat puna. It grows to about eighteen inches in diameter and eighteen feet high; and is used by the native carpenters for the frames of vessels. It grows curved, and is not durable. It is not found in any quantity in the forests.

Vellai punu pinu, the Tamil name of a Malabar and Canara tree, which is the white peon pinu: it can be obtained on all parts of the coast of Malabar. It grows to seventy and eighty feet long, and two to three feet in diameter; the natives use it for the masts and yards of dowses and country vessels. It is more like the American white pine, and the upright yellow wood at the Cape of Good Hope (*Antinacuatiss*), than any wood he had seen.

Puna balle in Tamil, and *Punga marum* in Malayala, is a beautiful tree and of much value; it grows to about two and a half feet in diameter, and from ten to fifteen feet long, spreading its branches, to a great extent, and into curves of various dimensions, which are valuable for native uses, particularly in building country vessels. It produces a fruit from which oil is extracted, and is used for lamps, &c. The Arabs prefer this oil to any other to mix with chunam, for the purpose of covering the bottoms of their vessels to preserve them from worms; it is also used for the purpose of curing rheumatic pains, by being applied warm with friction.—*Edye, Forests of Malabar and Canara, and Timbers of Ceylon; Major Drury's Useful Plants; Mr. Mendis, Drs. Roxburgh, Wight, Voigt, Gibson, and Cleghorn; Tredgold; Colonel Frith; Mr. Rohde's MSS.* See Poreal paini.

POONA, a river of Shahabad in Kotah.

POONA, a large town and military cantonment in the Bombay presidency, above the ghauts and about seventy miles East from Bombay. The provinces of Aurungabad and Beejapore, are arranged into two portions termed the Poona and the Southern districts, the latter with its head quarters at Belgaum; but to each of these two divisions there is likewise allotted the command of the immediately adjoining portions of the level land in the Concan. The Poona division is similar to that of Belgaum in the distribution of its force; of the soldiers in the command nearly the whole of them are in the province of Aurungabad from 1,700 to 2,300 feet above the level of the sea. Poona is about 1,750 feet above the sea, the annual fall of rain is 20 inches, the mean temperature is from 55° to 96°, and the rock is greenstone, and greenstone amygdaloid. One of the finest views of the city of Poona and the surrounding country is to be obtained from the fort of Parbuttah, once a Mahratta stronghold, now a

hindoo temple. The approach leads through a shady avenue of tamarind, mango, and coconut trees, to a small lake with an island, clothed with fruit-trees to the very margin of the calm and glassy water, in which are reflected the broad leaves of the plantain and palm, festooned with a woodbine-like creeper. This place, until the year 1817, was the city in which the Peshwas of the Mahrattas resided. A battle was fought there between the British and the Peshwa on the 16th November 1817, and the city was taken on the 19th November. See Hindoo, India, Kali, Kunbi, Mahratta, Nameswar, Purundhur, Peshwa, Reddi, Satti, Tripati.

POONAC, TAM., a name for the cake left after expressing the oil from the cocoanut pulp, it is used as a manure, and for feeding stock.—*Simmond's Diet.*

POONAG, in Bombay, the female plant of *Calysaccion longifolium*, *Roxb., W.*

POONAG also Poonaga, BENG., SANSO. *Alpinia nutans*.

POONAILITE, a mineral occurring crystallised in long slender crystals. Primary form a right rhombic prism. Fracture uneven, colourless. Hardness 5.0 to 5.5. Transparent, translucent. Lustre vitreous. Found in Poonah in the East Indies. The following is an analysis by Gmelin in 100 parts.

Silica.....45.120	Soda, with trace
Alumina....30.446	of potash.....00.657
Lime.....10.197	Water.....13.386

—*Eng Cyc.*

POONATA, SINGH. See Palmyra wood; Porcupine wood.

POONAY-KALLI, TAM. *Mucuna prurita*.

POONAY-OIL, or Poon-seed-oil, a bitter lampoil, obtained from the seeds of *Calophyllum inophyllum*, which yield about 60 per cent. of their weight of oil. It is also called Pinnaycottay-oil.—*Simmond's Diet.*

POONCANDAY-MARAM, TAM.?

POONEER, TAM. A very light white coloured earthy matter containing a great proportion of carbonate of soda, and from which, as well as from the Over Munnoo, soda is prepared. Pooneer is employed in making glass, in dyeing blue and scarlet and also by the chucklers in dyeing leather red.—*Ains. Mat. Med., p. 192.*

POONGA or KURUNJ OIL.

Kurunj ka tel,	HIND.	Kanoogoo noona,	TAL.
Poonga yennai,	TAM.		

This oil, which in some parts of the country is used to a large extent in adulterating lamp oil, is expressed from the seeds of *Dalbergia arborea* or *Pongamia glabra*, common in most parts of the Madras Presidency. In North Arcot, Bellary, and the Nuggur Division of Mysore, the oil is procurable at Rs. 2-8-0 per

maund. It is chiefly used as a lamp oil by the poorer classes.—*M. H. J. R.*

POONGGEE, HIND., a musical instrument. Of this there are two varieties, one made of leather and sometimes accompanies the kunchnee-ka-taefa; the other of pumpkin, usually played upon by jugglers and snake-dancers, &c.

POONGUM-MARAM, TAM. *Pongamia glabra*.

POONGYEE, BURM., a buddhist monk of Burmah,

POONKEE, TEL. *Gyrocarpus jacquini*, grows in the Godavery forests, has a wood soft and light, much used for making cowrie boxes and toys, takes paint and varnish well. Tella poonkee, the *Givotea rottleriformis*, is used also for the same purposes.—*Captain Beddome*.

POONNACOO KEERA, TAM. *Melochia corchorifolia*.—*Linn.*

POON-NAG, also Poon-naga, **BENG., HIND.** *Rottlera tinctoria*.

POONNAG-CHAMPA, BENG. *Alpinia nutans*.

POONNAY, TAM. In Tinnevely, a wood of a deep straw colour, used for building purposes.—*Colonel Frith*.

POON-OOZ, see Kush or Cush.

POON-SEED OIL, Oil of *Calophyllum inophyllum*.—*Linn.*

POONTUREKA, BENG., HIND. *Nelumbium speciosum*.

POONAM, TAM. The full moon, amongst hindoos a holiday. The poonun, or last day of the month Cartica, is the Macara sancranti, or autumnal equinox, when the sun enters the zodiacal sign Macara, or Pisces. On this day the rana of Mewar and chiefs proceed in state to the Chougan, and play at ball on horseback. The entire last half of the month Cartica, from Amavus (the ides) to the Poonun, is sacred to Vishnu; who is declared by the Puranas to represent the sun, and whose worship, that of water, and the floating-lights placed thereon,—all objects emblematic of fecundity,—indicate the adoration of the powers of nature: clearly proving all mythology to be universally founded on an astronomical basis.

POONURNUBA, BENG. *Boerhaavia diffusa*.

POONYANI, a river of the Malabar coast. The western or Malabar ghauts extend nearly north and south from Candeish to Cape Comorin or from 21° to 8°, and form a nearly unbroken chain, except at the chasm nearly sixteen miles in breadth, which opens into the valley of Coimbatore, and through which the river Poonyani escapes into the sea.—*Royle, Ill. Hm. Bot., p. 6.*

POON-YET, BURM. *Calophyllum* species.

POOR, HIND., (lit. full), a ceremony so called.

POORALLEE, a river of Beloochistan about 100 miles long. It rises in Jhalawan province

about lat. 27° 23', long. 66° 21', runs southerly through Lus province into the Indian Ocean, in lat. 25° 23', long. 66° 20'; near Sonmeanee. From the bund N. of Lyaree, the river has no bed. As it fills, during the rains, the bund is swept away, and the water inundates the plain, which is here about five miles broad.

POORANA-OIL, see Oils.

POORANA or the Pooranas, are sacred books of the hindoos. Most of the Pooranas contain portions of historical as well as geographical knowledge. Every Purana treats of five subjects: the creation of the universe; its progress, and the renovation of the world; the genealogy of gods and heroes, chronology, according to a fabulous system; and heroic history, containing the achievements of demigods and heroes. Since each purana contains a cosmogony, both mythological and heroic history, the works which bear that title may not unaptly be compared to the Grecian theogonies. The Genesis of India, commences with an event described in the history of almost all nations, the deluge, which, though treated with the fancy peculiar to the orientals, is not the less entitled to attention. The essence of the extract from the Agni Pooran is this. "When ocean quitted his bounds and caused universal destruction by Brimha's command, Vaivaswata Menu (Noah), who dwelt near the Himalaya mountains, was giving water to the gods in the Kritmala river, when a small fish fell into his hand. A voice commanded him to preserve it. The fish expanded to an enormous size. Menu, with his sons and their wives, and the sages, with the seed of every living thing, entered into a vessel which was fastened to a horn on the head of the fish, and thus they were preserved." In this fable the grand northern chain is given as that to which the abode of the great patriarch of mankind approximated. In the Bhavishya it is stated, that "Vaivaswata (sun-born) Menu ruled at the mountain Soomeru. Of his seed was Cacoosta rajah, who obtained sovereignty at Ayodia and his descendants filled the land and spread over the earth. Sumeru is the term by which the hindoos designate the north pole of the earth. But they have also a mountain with this same appellation of pre-eminence of Meru, 'the hill,' with the prefix Soo, 'good, sacred,' the sacred hill. To the south of Soomeru are the mountains Himawun, Hemcoota, and Nissida; to the north are the countries Nil, Suwet, and Singie. Between Hemachil and the ocean the land is Bharatkhand, called Cocarma Bhoomi, (land of vice, opposed to Aryaverta, or land of virtue), in which the seven grand ranges are Mahendrachil, Mulliachil, Sujrachil, Sactimun, Rikya-chil, Vindyachil, and Paryatra. The sacred

mountain Soomeru is claimed by the brahmins as the abode of Mahadeva, Adiswar, or Baghes; by the Jains, as the abode of Adinat'h, the first Jiniswara, or Jain lord. Here they say he taught mankind the arts of agriculture and civilized life. The Greeks claimed it as the abode of Bacchus; and hence the Grecian fable of this god being taken from the thigh of Jupiter, confounding meros (thigh) with the meru (hill) of this Indian deity. In this vicinity the followers of Alexander had their Saturnalia, drank to excess of the wine from its indigenous vines, and bound their brows with ivy (vela), sacred to the Baghes of the east and west, whose votaries alike indulge in strong drink. These traditions appear to point to one spot, and to one individual, in the early history of mankind, when the hindoo and the Greek approach a common focus; for there is little doubt that Adinath, Adiswara, Osiris, Baghes, Bacchus, Menu, Mincus, designate the patriarch of mankind, Noah. The hindoos can at this time give only a very general idea of the site of Meru; but they appear to localise it in a space of which Bamian, Cabul, and Ghizni, would be the exterior points. The former of the cities is known to possess remains of the religion of Buddha, in its caves and colossal statues. The Paropamisana Alexandria is near Bamian; but the Meru and Nyssa of Alexander are placed more to the eastward by the Greek writers, and according to the cautious Arrian between the Cophas and Indus. Authority localizes it between Peshawur and Jellalabad.—*Essay on the Sanscrit and Pracrit Languages*, by H. T. Colebrooke, Esq.; *As. Res.*, Vol. vii, p. 202; *Tod's Rajasthan*, Vol. i, pp. 20-22. See Purana.

POORANA, SANS. Old.

POORANA, SANS., from pree to fill.

POORASUM, TAM. *Butca frondosa*.

POOREE, SANS. A house, a palace.

POOREEAN, also Pooreean kay choontee, HIND. A ceremony.

POORI, a town in Orissa.

POORNA BABA, also called Poonurbuda, a river near Singaon in Dinagepoor.

POORNA, a river of the W. Ghauts, lat. 20° 59', long. 73° 44' W., disembogues into the Indian Ocean, length 60 miles.

POORNABHISHIKTA, SANS., from poorna, full, and abhishikta anointed.

POORNAH, a tributary to the Taptee river. It rises in lat. 21° 35', long. 77° 41' runs S., 65 miles, W., 25 miles into the Taptec, length 160 miles.

POOROHITA, SANS., from pooras to go before, and hita, good. Every brahman may perform the ceremonies of his religion. The priest, called a poorohita, is, however, called in

to assist in the shraddha, the ten ceremonies called sungskaru, and in those at the offering of a temple.—*Ward's Views of the Hindoos*, Vol. ii, p. 15.

POOROO, URIA. *Conocarpus latifolia*, ROXB.

POOROOHOOTA, SANS., from pooroo, fullness, and hoo, to call.

POOROOSHA, SANS. A male, from pree, to fill or nourish.

POORSII, the standard measure of the Rajpootana desert, is from six to seven feet, or the average height of a man, to the tip of his finger, the hand being raised vertically over the head. It is derived from poorosha, 'man.'—*Tod's Rajasthan*, Vol. ii, p. 307.

POORU or Poora, SANS., also Pur, HIND.

PUR, Poor, Pore, SANS. Ur or Oor or Ore. TAM. A town.

POORUNDURA or Poorandara, SANS., from poora, a house, and dree, to cut.

POORUSHCHARANA or Poorushcharana, SANS., from pooru, before, and charana, practice.

POORUN, a ceremony.

POORAWAT, see Baba.

POORVAVAT, SANS., from poorva, a cause, and vat.

POOSAKA, JAV. An heirloom.

POOSIIEENI, or Fusini, TEL. *Cucurbita maxima*.

POOSHIKARA SHANTEE, SANS., from pooshikara, the evil fortune attending a person who shall die when an unlucky day, an unlucky lunar day, and an evil planet all unite, and shantee, to pacify or produce peace.

POOSHIPAVULEE, SANS., from pooshpa, a flower, and avulee, a row.

POOSHPU-DHANWA, SANS., from pooshpa, a flower, and dhanwa, a bow.

POOSHPAKA, SANS., from pooshp, to expand.

POOSHTEE also Pooshana, SANS., from poosh, to cherish.

POOSTPA, also Asvudum, SANS. *Thespesia populnea*, LAM. The fruit.

POOTA, TAM. Large fishmaws.

POO-TA-LA, or great temple, near Zhe-hol, in Tartary, with the town of Zhe-hol in the distance taken from a hill on the emperor's park. The smaller buildings which surround this large fabric are the habitations of the priests, or lamas, about eight hundred of which are attached to this temple.—*Baron Macartney's Embassy*, Vol. i, p. 27.

POO-TOO is an island about forty miles from Chusan, inhabited solely by celibate priests, no woman resides on the island, which is covered with temples of all descriptions, many of them very handsome, but one in particular, which was built by the emperor of China. The island is not large, and is laid out like a vast

POPE, the title of the religious sovereign of the Romish sect of Christians. The whole number of Popes from St. Peter to Pius IX, is 257. Of these, 82 are venerated as saints, 33 having been martyred: 104 have been Romans, and 103 natives of other parts of Italy; 15 Frenchmen; 9 Greeks; 7 Germans; 5 Asiatics; 3 Africans; 3 Spaniards; 2 Dalmatians; 1 Hebrew; 1 Thracian; 1 Dutchman; 1 Portuguese; 1 Candiot; and 1 Englishman. The name most commonly borne has been John: the 23rd and last was a Neapolitan, raised to the chair in 1410. Nine Pontiffs have reigned less than 1 month, thirty less than 1 year, and eleven more than 20 years. Only five have occupied the Pontifical chair over 23 years. These are: St. Peter, who was Supreme Pastor 25 years, 2 months, 7 days; Silvester I., 23 years, 10 months, 27 days; Hadrian I., 23 years, 10 months, 17 days; Pius VI., 24 years, 8 months, 14 days; Pius IX., who celebrated his 25th year in the Pontifical chair, June 16th, 1871.

The poppy is cultivated in Egypt, Central Africa, Asia Minor, Persia, in British India and in China, for its products, viz: the opium or concrete juice, its capsules or poppy heads, the seed called poppy seed, and for the poppy seed oil, but of these opium is by far the most important.

The Capsules.

Post, HIND.

In medicine they are employed for their anodyne properties, in fomentations for inflamed surfaces, and a syrup is prepared from them to allay cough, &c. In upper India an intoxicating liquor is prepared by heating the capsules of the poppy with jaggery and water.

The dried juice.

Opium is obtained from the poppy in Asia Minor, Egypt, Persia, S. E. of Asia and in China. It is used medicinally as a narcotic and soporific, and morphia and other drugs are prepared from it. It is also in British India taken internally as a nervine stimulant in the form of pills or in a compound called majoon; the Rajput races make a watery solution of it, called kusumbha. Colonel Tod observes that in his time a Rajput inebriated with spirituous substance was a rare sight: but a more destructive and recent vice had usurped much of the honours of the Manwar-piala or "invitation cup," which had been degraded from the pure "flower," to an infusion of the poppy, destructive of every quality. Of this pernicious habit he uses the words which the historian of German manners applies to the tribes of the Weser and Elbe, in respect to their love of strong drink: "indulge it, and you need not employ the terror of your arms; their own vices will subdue them." The Chinese mode of using opium is by smoking a preparation of it called Chandoo, a soft black treacle like mass. In Madras there are about six opium smoking

shops. The opium of British India is chiefly manufactured in Hindustan, Malwa, Berar, and Mysore, and is largely exported to China. In the year 1872-3, the revenue of British India, derived from opium was 9½ millions sterling.

In a paper by Dr. Smyttan, inspector of opium at Bombay, which was lately read before the Medical Society of Calcutta, an account is given of the varieties of East-Indian opium, and a comparison drawn between the quantity of morphia afforded by Bengal, Malwa, and Turkey opium respectively, from a series of experiments made by himself and Dr. Maxwell at Bombay and by Dr. Jameson in Calcutta. Dr. S. observes, that good Turkey opium is said to contain nearly three times the quantity of morphia found to be procurable from the product of the Bengal provinces. The best produce of the Malwa districts, he adds, differs from Bengal opium, both in appearance and quality, quite as much as the Turkey opium does, and that while the latter yielded 6½ per cent. of morphia, the Malwa afforded 6 per cent., the Bengal about half as much, but some fine specimens of Barcilly opium, no less than 8½ per cent. of morphia. Still further to the north-west than Barcilly, he made some opium at Saharunpore which in colour smell, and general appearance, resembled the Turkey, or rather Persian opium, more closely than any that he had seen. The opium cultivated in the hills, as also that in the plains of the Seikh country, is also, when unadulterated of a superior quality. Indeed if it were an object to make the best opium for the European market, there is no doubt that Malwa and the north-western provinces of India would be best suited for the experiments as the climate during the season of cultivation most nearly resembles that of the provinces where the best Persian (commonly called) opium is made.

Poppy Oil.

Khush-khash-ka tel, HIND | Cas-cas yennai, TAM.
Minak bunga madat, MAL. | Gasa-gasa nuna, TEL.

In Malwa and the opium districts, the drying oil obtained from the seed is more extensively used than any other, both in lamps and as food. At Bhopaul the oil is procurable at the rate of Rs. 4-8 per maund of 25lbs. or £40-6 per ton. By simple exposure to the rays of the sun in shallow vessels, this oil is rendered perfectly colourless. It is much prized by European artists. There are two varieties of seed white and black, (or rather blue gray color) but they yield an oil precisely similar. The seeds would yield by expression about 50 per cent. of a bland and very valuable oil, of a pale golden colour, fluid to within 10° of the freezing point of water. It dries easily, is inodorous, of agreeable flavour, and partially

soluble in alcohol. The seed is worth about 61s. in the English market. It is expressed by means of a heavy circular stone, placed on its edge, made to revolve by a long lever, and the apparatus is worked by draught bullocks. Mr. Bingham.

The seed has no narcotic qualities, but has a sweet taste, and is used, parched, by the lower class of natives as a food, it is also much used by the sweetmeat-makers as an addition in their wares. This and the seed of the Teel (*Sesamum orientale*) are the only oil seeds, with the exception of the cocoanut, which are used for that purpose. It produces, under the native method, a clear, limpid oil, which burns very quickly. About 30 per cent. of oil is generally extracted, and the cake is then sold as a food to the poorer classes. The oil sells at about 5 seers per rupee at Shahabad. The production of this seed is only limited by the production of the poppy. In Oudh each ryot sows from 2 to 4 beegahs in the month of October. The oil is extracted by the common native press. The cost of the seed is 10 seers for the rupee, and the oil sells for 3 seers for the rupee; two-fifths of the weight of the seed employed is about the proportion of oil yielded by the native process. The poppy seed is eaten by the natives made into sweetmeats, provided the opium is extracted from the seed vessel, otherwise it is bitter and narcotic, and under these circumstances the oil extracted is also bitter. The oil is used for cooking and burning." It is a bland drying oil, extensively used in the Madras presidency, and some other parts of India, than any other, both in lamps and for food.

Poppy seeds are employed in medicine for the preparation of a sedative decoction and syrup. In India they are used by the natives in sweetmeats, and by some classes of the hindoos at some of their festivals. Poppy seeds are exported from Bombay to England and France.—*Royle, Ill. Him. White poplar	ENG. Spelda, sperda, TR.INDUS.
Safeda, baid,	HIND.

The white poplar is found in the Sutlej valley between Rampur and Sungram. It grows to a considerable size in parts of the basins of the Jhelam and Chenab, and is occasional on the Sutlej, ranging from 4,000 to

POPULUS CILIATA.

8,500 feet, reaching 9,000 in Tibet. Trees of 6 and even 8 feet in girth and 50 or occasionally 70 in height are seen, but they are mostly considerably smaller than these sizes. Of thousands of specimens, Dr. Stewart had never seen one in fruit. Wild trees are often seen uprooted by the wind. The tree is also common, planted in parts at least of Afghanistan to 9,200 in Tibet, (Thomson), is not uncommon, planted at Peshawar, and grows at Lahore, is cultivated in Trans-Indus and in Cabul. The tree grows to a large size in Pangni, and is used for roofing in Ladakh and Lahaul. It is propagated by cuttings. The timber is white and soft, but not strong or durable, and is not valued. In Afghanistan it (with perhaps that of *P. fastigiata*), is used for manufacturing the round boxes in which grapes are exported to India.—*Dr. Thomson's Travels*, p. 207; *Cleghorn's Report*; *Kulloo and Kangra*, p. 64; *Powell's Punjab Products*, Vol. i, p. 385; *Dr. J. L. Stewart's Punjab Plants*, p. 203.

POPULUS BALSAMIFERA, Linn.

Yarpa, CHENAB. Berfa, makal, maghal, LAD.
Balsam poplar, ENG. Maal, changma, PANGI.

On the Chenab, river both *Populus balsamifera*, 'yarpa,' and *P. nigra*, are planted near villages, but in much smaller numbers than the willow. Dr. Stewart says *P. balsamifera* is common, planted in Lahoul at 9 to 10,000 feet, and in Ladak up to 14,000 feet, in Spiti to 12,500 feet, and probably on the Sutlej. Aitchison mentions that in Lahoul it is never cut, as it is supposed to be the abode of the dewa (deity,) and festivals are held under some of the finer specimens, which reach 50 feet in height. In Ladak they reach 60 or 70 feet, and Dr. Stewart has there noted a plank of the wood $2\frac{1}{2}$ feet broad, and seen one tree of 9 feet girth.—*Dr. J. L. Stewart's Punjab Plants*, p. 204; *Dr. Cleghorn's Punjab Report*.

This grows in the Sutlej valley between Rampur and Sungnan at an elevation of 6,000 feet. It is common wild in the Punjab Himalaya up to the Indus at from 4,000 to 10,000 feet. Occasionally reaching 10 feet in girth, and from its leaves resembling those of the pipal, *Ficus religiosa*, is frequently called by that name by men from the plains. The wood is soft and not valued, but is used for water troughs, and in Hazara occasionally for gun-stocks. In some places the leaves are given as fodder. There is a plentiful floss round the coma of which has at times been

POPULUS NIGRA.

recommended for paper-making, &c.—*Dr. Cleghorn's Punjab Report*, p. 64; *Dr. J. L. Stewart's Punjab Plants*, p. 204.

POPULUS EUPHRATICA, Oliv.

Hodung, Hotung, LADAK. | Bahan (Push. SUTL. TR. IND.
Bhan; Labhan, PUSHTU. | Safeda; Sperawan, "

The tree, originally discovered on the banks of the Euphrates, has been found by Griffith, and more recently by Dr. Stocks and others, to be abundant on the banks of the Indus, in Sind and Multan, also at intervals along the valley of the Indus, within the mountains, but it appears to be far from common there and to confine itself to hot sandy places. In several parts of Nubra it is common enough, but only, so far as Dr. Thomson observed, on the south side of the Shayuk. It is thus remarkable for its extended distribution. This is also remarkable for the very changeable shape of its leaves, which vary from broadly deltoid and coarsely toothed, to narrow-linear and quite entire. The leaves of the full-grown tree are generally broad and much toothed, while young plants have very narrow leaves; the shoots of pollared plants, which are common, the tree being much used for fuel, are also narrow. The wood, being white, (and so not flesh-coloured), is preferred for constructive purposes by hindos, and for the same reason the twigs are used by them as tooth-sticks. The wood is rarely used for boats in Sind, but is said to be largely so employed on the Euphrates, &c. It is also employed for fuel in the south (in part even for steamers, although from its lightness it is not very suitable), and in parts of Tibet where it grows, up to 10,500 feet, it furnishes much firewood. In Sind the bark is given as a vermifuge, and the liber is employed as a gun-match. The timber is good, not very hard, white or yellow, suitable for turning. The tree grows on the banks of the Indus and Chenab. The twigs are exported and sold at Lahore and elsewhere for tooth brushes. The Euphrates poplar, is common in clumps, on the Sutlej bank, but does not grow large and is generally crooked. It flowers in February, and throws up root-shoots with great rapidity. The wood is objected to for steam fuel, owing to the great emission of sparks which endanger the awning of the boat.—*Dr. Thompson's Travels in Western Himalaya and Tibet*, p. 189; *Dr. J. L. Stewart*, M. D.; *Dr. Cleghorn, in Punjab Report Kulloo and Kangra*; *Powell*.

PORACCHI, in his *Isolario*, published at Padua in 1570 gives an account of the inhabitants of Batech, which Sir J. E. Tennant surmises to be Batticaloa. He describes them at being constantly at war with their neighbours, eating the flesh of their prisoners, and selling their scalps at high prices.—*Tennant's Ceylon*, p. 2.

PORAL, Hino. Heracleum, sp.

PORCELAIN.

Tse-ki,

CHIN. | Choni-kam, Guiz., HIND.

A very fine species of earthenware, white, semi-transparent, and sometimes beautifully coloured and gilt. Chinese porcelain, which is of an exceedingly fine texture, has long been renowned ; but British porcelain, although unable to boast of such fine specimens of costly workmanship, has risen to be a matter of great importance. Dresden has long been famous for the beauty of its porcelain productions ; but the finest and most magnificent specimens of European China, have been produced at Sevres in France. Sir John Davis has condensed all the important information concerning the materials and manufacture of porcelain,—a name given by the Portuguese to the semi-transparent cups they saw on their arrival, from their resemblance to the lustrous nacre of sea-shells, or porcellana, for they supposed it to be a composition of egg-shells, fish-glue, and scales—a good instance of the off-hand descriptions travellers formerly indulged in, just as Chinese writers now describe things new to them ; as, for instance, when they call caoutchouc elephant's skin.

The Kaolin or Kau-ling. i. e., high ridge, the name of a hill near Jauchaufu, is obtained from the disintegrated granite in that region, and is nearly pure felspar, or such as contains no metallic substance ; by slow decomposition the alkali and part of the siliceous is removed, and water imbibed. An analysis of the clay used in Europe, which probably does not differ materially from that employed in China, shows the constituents to be silica 43, alumine 36, water 19, and a trace of magnesia and carbonate of lime.

The petuntse, or pehtuntsz, is nearly pure quartz, and the best is of the Chinese, brought from Hwuichau in Nganhwui, but is procurable elsewhere ; it is reduced to an im-

palpable powder by toilsome processes, and formed into cakes to sell to the manufacturers.

Steatite or soap-stone called haw shih, is also employed, and some forms of carbonate and sulphate of lime, which are mixed in to produce an inferior article, though still among the best now manufactured ; the soap-stone ware is more brittle than the other, but fine, white, and very light. The proportions of the ingredients vary according to the desired fineness of the ware.

After the paste or biscuit is thoroughly mixed and formed into the required shape, the dishes are painted by workmen, each of whom takes a single colour and a single part of the picture. The whole surface of the dish is sometimes covered with gay figures, but the most common decorations consist of heroes, statesmen, &c., in different attitudes and costumes, and sentences beautifully written referring to them and their times. Most of the inscriptions and figures seen upon mantel-piece ornaments, tea-cups, and jars, are of this nature, explaining some event in the life, or a panegyric upon the personage there represented ; this affords an opportunity for persons to show their scholarship in explaining the quotation. The colours used on the fine porcelain have long been admired, and DesGuignes, who made many endeavours to procure samples of them and ascertain the mode of mixing them, has given the composition of some of the principal colours, but at present there is probably little to learn from them in this branch. After the workmen have finished the painting, the pieces are covered with a liquid mixture of alkali, obtained from burning ferns with the quartzose petuntse, after which they are baked. The best articles are surrounded with a case lined with sand in order to protect them from the flame, and as the furnaces are only about six or eight feet square, the closest attention can be paid to the condition of the ware, and the exact time ascertained for reducing the heat and opening the kiln. Some of the pieces brought from the interior are perfectly white, and the patterns are afterwards painted and fixed on them according to the fancy of the customer. The finest specimens are from the kilns of King-teh-chin in Kiangse.

Black China-ware, the Ow-mi-ew, ornamented with gold, is very much prized in China : to make this ware they mix three ounces of azure, and seven of the oil of stones ; this is laid on the ware, and when perfectly dry, it is baked, after which the gold is laid on, and the vessel is re-baked.

Cracked porcelain, the To-wi-kie, China-ware is highly prized under the cognomen of cracked porcelain. It is prepared simply by varnishing the vessels with a whitish ash-

coloured varnish, made from calcined transparent white pebbles; this has the property of marbling and veining the ware, and giving it an appearance as if it had been fractured into many pieces, which had been carefully reunited.

Chinese red colour, used in the porcelain painting, is made from Taow-fau, or copperas; their mode of preparation is by putting a pound of copperas into a crucible, over which another crucible is luted, having a small hole in it, which is lightly covered over: around these they pile charcoal, and enclose the whole within bricks when they fire the charcoal, and as soon as the fumes, issuing from the aperture in the crucible, become of a light colour, a small quantity of the copperas is taken therefrom, laid upon fir-wood, and moistened with water; if the colour then prove to be a bright red, they remove the fire, if not, they allow the copperas to remain subjected to the heat until it assumes that colour, and then remove the fire. When the crucibles are cool, a cake is found in the lower one, but the finest colour is entrusted on its sides and on the bottom of the upper crucible, which is kept separate from the cake; the pound of copperas produces about four ounces of colour.

Chinese white colour also used in painting porcelain, is made from calcined transparent flint, to an ounce of the powder of which they add an equal quantity of white lead.

Chinese green a beautiful colour is prepared with one part of powdered calcined flint, two parts of white lead, and six parts of the scales of well hammered copper.

Chinese violet is produced by adding an additional quantity of the prepared white to the green.

Chinese yellow is made by combining equal portions of prepared white and red. All these various colours are used by the China-ware painters, having been previously dissolved in gum-water, to which they occasionally add saltpetre, copperas, or white lead. The colours are laid on after the first baking and varnishing of the China ware, but the beauty and depth of the colouring is imperceptible until after the second taking.—*Williams' Middle Kingdom*, Vol. ii. pp. 116-117. See Pottery.

PORCELLANEN, Gsw., the Cowry shell. Cypræidæ.

PORCINE DEER, of Pennant: *Hyelaphus porcinus*. *Sunder.*

PORCUPINE, of Europe, Asia and Africa, is a name given to several species of the genera *Hystrix*, *Atherura*, and in America of genera of the group *Cercolabinae* or *Philodendreae* more or less arboreal. In British India, the species are known as the Indian porcupine, the Bengal porcupine, the crestless porcupine, and the Malay porcupine: the crested porcupine belongs to Europe and the African porcupine is the *H. Africa-ustralis*, *Peters*. Of Ceylon porcupines, Dr. Ke-hart is quite certain of *Hystrix leucura*, *Sykes*, (*H. Kirautirostris*). Mr. Blyth compared it with Waterhouse's description, and it quite corresponds; so that *H. zeylonensis* makes a second species of the genus in Ceylon. He terms it *H. etava*. In Ceylon it is destructive to the young cocoanut palms, to which it is a pernicious and persevering, but withal so crafty, a visitor, that it is with difficulty any trap can be so disguised, or any bait made so alluring, as to lead to its capture. The usual expedient in Ceylon is to place some of its favourite food at the extremity of a trench, so narrow as to prevent the porcupine turning, whilst the direction of his quills effectually bars his retreat backwards. On a newly planted cocoanut tope, at Hang-welle, within a few miles of Colombo, Sir J.E. Tennent had heard of as many as twenty-seven being thus captured in a single night; but such success is rare. The more ordinary expedient is to smoke them out by burning straw at the apertures of their burrows. At Ootacamund, on the continent of the Dekhan, spring guns have been used with great success by the Superintendent of the Horticultural Gardens, placing them so as to sweep the runs of the porcupines. A planter on the Neilgherries recommends that a musket or single barrel pistol, be procured and an iron rat-trap; the gun must be placed so that on being discharged the shot will sweep the gap or entrance. In this position it must be firmly fastened. The trap is then to be set, the compressed spring let in between the trigger and trigger guard of the piece, and tied to a peg—then a string blackened with ink, attached to the plate of the trap is stretched loosely along the gun and across the gap and fastened—so that nothing can pass in without touching it. As the cord is loose, the animal in entering gets well opposite the gun before it tightens and springs the trap, the piece having been placed on full cock is of course fired by the rising of the trap spring. A pistol is much better than a gun, because the latter has to be set horizontally, in which case it is very liable to miss or only wound the ani-

mal it is set for; a pistol can be placed vertically in which case it cannot but hit anything passing through the gap under it. Sambur, which are given to walking along estate roads may also be got to commit suicide in this manner, only for them, the touch string must be tied low so that the feet and not the nose of the animal strike it, or the ball will most likely go under the neck and not between its ribs. For ordinary Sambur the gun must shoot 3 feet off the level of the road. In setting a gun, one must remember that the last thing done is to full cock the piece, or an accident would be very liable. In setting the hammer should rest on the nipple, and not at the half cock as then in case of the traps accidentally springing, the lock will be damaged. An old hat or piece of wax cloth should cover the lock to keep off the damp. The flesh is esteemed a delicacy in Ceylon, and in consistency, colour, and flavour it very much resembles young pork. Baron de Bode found the dried dung and bristles of numerous porcupines in the cells beneath the ruins of the palace of Jemshid, in Persepolis, but no living animals: and was informed that these animals occupy the cold cells only during the heats of summer, and migrate to the south in thousands so soon as the cold weather commences, travelling direct over hill and dale by the shortest route.

Atherura fasciculata, the Malayan porcupine, is found on the Tipperah hills and thence southwards to the Malayan peninsula. It has a much larger tail than the true porcupines, ending in a tuft of long bristles. The spines of the back are less elongated.

Hystrix bengalensis, Blyth.

H. malabarica, Sclater. | Bengal porcupine, Eng.

Found in Travancore, Cochin, S. Malabar, Bengal, Assam, and Arakan. Length head and body 28 inches, tail 8 inches. In Malabar, its flesh is more esteemed than that of the common variety.

Hystrix leucura, Sykes, Blyth, Elliot.

H. hirsutirostris, Brandt. | H. cristata indica, Gray.

H. zeylanensis, Blyth. | H. Hard.

Sajru, BENG. Sarsel, HIND.

Indian porupine, CAN. Salendra, MAHR.

Hoigu, ENG. Dumsi, NEPAL.

Say, Sahi, Sayal, GOND. | Yeddu pandi. TEL.

This porcupine is found over all India from the Himalaya to Cape Comorin, except in Bengal. It is 32 inches long and its tail is seven inches. They charge backwards on their foes and dogs often get seriously injured. The flesh is good eating.

Hystrix longicauda, Marsden, Blyth

Hodgson. | Acanthion javanicum,

Gray.

F. Cur.

Crestless porcupine, Eng. | O'-e, LISBON.

Sathung, LEWCH. | Anchotia dunisi, NEPAL.

This lives in Nepal and Sikkim and southwards into Burmah, Malayana and the Archi-

pelago. They are mischievous, rooting up the tuberous roots sown in the gardens, they breed in confinement, their flesh is good. It measures 22 to 24 inches from snout to vent, and stands about 8 inches high. *Porcupines* are such very destructive creatures, and it is so difficult to kill them, owing to their strictly nocturnal habits, that we are induced to give the following plan for their extinction in the hope, that some unfortunate Neilgherry tree or vegetable planter, who suffers from the ravages of porcupines may benefit by it. The writer says "I practised my plan in a good sized garden, in which I grow fruit and vegetables of various kinds, and which I cannot afford to fence in properly. Porcupines used to come night after night, and destroy my best things, so I began to consider how I could protect my produce from these nocturnal pests. I found that they prefer potatoes to any other vegetable, so I planted $\frac{1}{2}$ a maund in the garden and fenced in the patch on 3 sides, with billets of firewood, leaving the fourth open. The porcupines very soon discovered their favorite food and commenced devouring the seed potatoes. I therefore at once replaced what they had eaten and shut in the open side;—they came again and the fence being strong they had some trouble in making an entrance—once in, however, they always entered the patch in the same place. As soon as I was sure of this, I set a spring gun across the gap, and next morning found porcupine No. 1 dead. I shut up the entrance, and for some days the brutes left me alone, but soon they returned and again cut through the fence, my gun was placed and at once No. 2 fell. In this way with perseverance I killed many; in fact all that came to my garden, for my vegetables were now left untouched.

"Porcupines I hear are very troublesome in tea plantations. They root up the plants to get at their thick sap root, and also the seed if there is any. I should advise tea planters, who suffer from the depredations of these animals, to sow several small patches of potatoes in different parts of their estates, and I believe with a little trouble they would soon rid their neighbourhood of the pest."—*Tennent's Sketches of the Natural History of Ceylon*, pp. 45, 46; *Jerdon's Mammals*; *Beng. As. Soc. Journ.*, No. 181, Aug. 1847.

PORCUPINE WOOD. Wood of Cocoonut palm.

POREAL PAINI, TAM., MALEAL. A timber of Malabar and Canara which may be among the best sort of the Dupi or Paini maram and next to the peons on the coast of Malabar. It might be used for small yards of vessels. At times this wood is called Puni paini by some of the northern natives: it is of a light red colour,

PORIPHORA.

and grows to about eighteen inches in diameter, and sixty feet long.—*Edg.*, *Forests of Malabar and Canara*. See *Pooh*.

POREBUNDER, is built on a creek of the sea, on the south-west coast of Guzerat. It is a large and populous town: and the inhabitants carry on a brisk trade with Bombay, Sind, and Malabar.—*Pottinger's Travels, Beloochistan and Sind*, p. 8. See Kattywar, Volcano.

Maravi,	CAN.	Nilgai; Nil; Lil,	HIND.
Guray; Guriya,	GOND.	Rui,	MAHR.
Roz; Rojib,	HIND.	Manu-potu,	TEL.

The male nilgai, probably the hippelaphus of Aristotle, is of an iron gray-colour, in length $6\frac{1}{2}$ to 7 feet; the female is smaller and of a tawny or light brown-colour. The male at the shoulder is $4\frac{1}{2}$ to $4\frac{1}{2}$ feet. It is found throughout India, but not in Ceylon, nor in the countries to the East of the Bay of Bengal.—*Jerdon's Mammals, p. 273.*

PORTIA, TAM.? A small Palghat tree; wood of a brown colour, used for musket-stocks, probably the *Thespesia populnea*.—*Col. Frith.* See Avenues.

PORTIA TREE, Thespesia populnea, Lam.
The oil.

Paris pippul ka tel,	HIND.	Ganga raji nuna,	TEL.
Purasum yennai,	TAM.		

This deep red coloured and somewhat thick oil is obtained from the seeds: the portia tree grows in great abundance in the vicinity of Madras, and other parts of the Presidency. It is extensively planted as an avenue tree, for which its quick growth and the beauty of its flowers render it a favourite. The wood is capable of being worked when fresh cut and is used for boat building and cabinet work. The juice of the tree is used on the western coast, as a remedy for various cutaneous affections, and the oil, which is yet unknown to the natives, might probably be of use in similar cases. Its expense precludes its use otherwise than medicinally.—*M. E. J. R.*

PORTO KOORWAN, URIA.? A tree of Ganjam and Gumsur, of extreme height 20 feet, circumference 1 foot, and height from ground to the intersection of the first branch 5 feet. Chiefly remarkable on account of its seeds, called here Indrajebho, which are used medicinally and held in great estimation. The juice of the leaves is given to young cattle to destroy worms.

PORTUGAL.

The bark is also used medicinally. The tree abounds.—*Captain Macdonald.*

PORTO NOVO, on the Coromandel Coast, in lat. $11^{\circ} 31' N.$, is a place of considerable trade.

PORTUGAL, a kingdom in Europe which made extended and continuous efforts to obtain power in the E. Indies and to christianize its people. Its chief agents were Albuquerque a soldier and Xavier a priest, but of all their possessions, Goa and Damaun on the west coast of the peninsula and Macao in China alone remain. Their first arrival in India was about the year 1495, under Bartholomew Dias, followed by Vasco de Gama, Cabral, Almeyda and Albuquerque who was recalled in 1516. Ceylon was occupied by the Portuguese in 1596, was taken possession of by the Dutch in 1658, and by the British in 1797. The Dutch nation first came to the Eastern Archipelago as the servants of the Portuguese. As D'Abreu progressed in the Archipelago, he erected white pillars of discovery which he called Padroe. It was a device of the Dutch to circumvent the Roman Catholics of Ceylon by prohibiting the use of the Portuguese language, being that of the priests educated and sent from Goa: the attempt was, however, unsuccessful; and it is somewhat curious that at the present time the Portuguese language is in almost universal use in all the towns in the maritime provinces of Ceylon, and that Dutch is not only almost extinct, but the descendants of the Dutch have betaken themselves to speak the language of Portugal.

In 1873, in Madras, the people who are descendants of Portuguese, continue to use that language amongst themselves, and this is also the case in Calcutta and Bombay. The people of mixed European Portuguese and Indian descent are generally very dark. Dabul or Debul, a seaport town on the Malabar coast, eight miles south of Severndroog, was burned about 1508, by the Portuguese viceroy Almeyda. He came to India, in 1505, the successor of Dias, Vasco de Gama and Cabral. On his arrival, he concluded a defensive treaty with the king of Vijianuggur, but the Venetians who up to that time had monopolized the trade with India, jealous of the growing power of the Portuguese, instigated the king of Egypt to oppose their progress. He accordingly sent a fleet under Mir Hukum, who, in conjunction with the fleet of Guzerat, bore down upon Lorenzo, son of Almeyda, and defeated him in 1508, Lorenzo falling in the fight. Almeyda, to avenge his son's death burnt the port of Dabul, and defeated the enemy in the harbour of Diu, and then concluded a treaty.

In 1509, the Portuguese leader Sequiera entered the Eastern Archipelago. In 1510, Alfonso Albuquerque visited Sumatra, and in

1511, took Malacca, which he fortified, and sent out Antonio d'Abreu to search for the Spice Islands. On his way eastward, D'Abreu touched at Agasai (Gresik) in Java. In 1511, the Portuguese visited Bantam. Ludovico Barthema was the first European who described Java from personal observation, but some of his statements as to the cannibal propensities of the inhabitants are questionable. In 1596, the Dutch, under Houtmann first arrived off Bantam, and found the native king at war with the Portuguese. They lent him aid, on condition of having land allotted at Jacatra for a factory. The earliest expedition sailed from Holland in 1594, under Houtmann, who visited Bantam and then Madura, where he had to pay 2,000 rixdollars to liberate some of his crew. On the 3rd of March 1599, he arrived off Hitu-Lama. War then ensued between the Spanish, Portuguese, and Dutch, which lasted till 1610, when the Dutch remained masters of these seas and monopolized the lucrative trade. The British tried to enter on that trade but they too were finally driven off. In 1610, the Dutch fortified the village of Jacatra which they named Batavia. In 1619, this was destroyed, but it was after rebuilt by Mr. Bolt, the Dutch governor-general, and this was the beginning of the present town of Batavia. In 1811, when France overran Holland, the flag of France was hoisted at Batavia, but in the same year the British captured it, only to restore it, on the 19th August 1816. Java up to the 13th century was partly hindoo, partly buddhist, partly mahomedan, but in the 15th century, mahomedanism took the lead, and in 1475 a mahomedan prince took the throne at the overthrow of the great kingdom of Majapahit, which had dominion over the whole of Java, and the eastern parts of Sumatra. In 1749, the reigning prince abdicated in favour of the Dutch East India Company. Seven years prior to that event, the sovereignty had been divided into a spiritual head, the "Susunan" or "object of adoration," whose descendants now reside at Surakarta near Solo, and a second prince who was styled sultan, and whose descendants reside at Jokyokarta, both of them highly pensioned. Portuguese is spoken in the territory of Goa in a few families, outside of this it is a corrupted dialect. It is also spoken at Macao. The Portuguese have still their towns and districts on the western coast of India, Goa, Damaun and Diu. About 1,500 square miles and 408,596 of population.—*Bikmore*, pp. 22—26. See Acheen, India, Kathi or Katti, Kattyawar, Kho, Kol and Koli, Ladrones, Perim, Parejos, Ribeiro or Ribeyro, Saugor island, Siam, Singapore, Wijao.

PORTUGUESE MAN OF WAR, one of the Acalephæ, is the *Holothuria physalis* Linn.,

the *Physalia pelagica*, Lam., also *Ph. careivella*, and *Ph. utriculus*. It has an inflated vesicle or bladder, glowing in delicate crimson tints which rises over and floats upon the waves, whilst the long tentacula, of a deep purple colour extend beneath as snares for capturing its prey. Their bladder is generally supposed to collapse in tempestuous weather, but Dr. Bennett says it always remains inflated. The tentaculæ sting.—*Bennett*, pp. 5 : 6.

PORTULACACEÆ, Lindl. The Purslane tribe of plants comprising 6 gen., 13 species, viz., 3 *Trianthema*; 5 *Portulaca*; 2 *Talinum*; *Calandrinia*, 1 *Portulacaria*; 1 *Claytonia*.

PORTULACA, a genus of the Portulacaceæ. Some species are pretty annuals with succulent leaves, and very brilliantly coloured flowers, red, purple, yellow, white, &c., they are easily grown from seeds, and if well watered and kept in the shade, will blossom throughout the hot season; the hybrids, between the white, and dark colours are remarkably pretty. These pretty little succulent annuals open their flowers in the sun. It is raised from seed, requires a sandy soil, requiring little care as regards soil; should be watered sparingly at all times.—*Riddell*; *Jaffrey*.

PORTULACA MERIDIANA, Linn., syn. of *Portulaca quadrifida*, Roxb., Linn.

A small troublesome weed with fleshy leaves, used as greens, common everywhere. Fresh

leaves, bruised, are prescribed as an external application in erysipelas, and an infusion given in dysuria.—*C'Shaughnessy*, p. 353; *Jaffrey*; *Dr. J. L. Stewart*. See Vegetables of Southern India.

PORTUNIDÆ, a family of Brachyurous crustacea, generally known by the name of Paddling crabs; for the most part essentially swimmers, and often live at sea. The following East Indian genera are arranged under the tribe by *M. Milne-Edwards*:—

Portunus integrifrons, (Cancer navigator (?) *Herbst.*: Carapace pubescent: length about 2 inches. It is a native of the Indian Ocean.

Lupea tranquebarica, (Cancer olivaceus, *Herbst.*: *C. serratus* (?) *Forsk.* *Portunus serratus*, *R. Ruppell*; *P. tranquebaricus*, *Fabr.* This is the largest known portunian, it is six or eight inches in length, of a grayish-green Asiatic seas.

Lupea pelagica, (Cancer pelagicus, *Linn.* *Cancer reticulatus* and *Cancer cedonulli*, *Herbst.* *Portunus pelagicus*, *Fabr.*) Length from three to four inches. Colour grayish-green with yellow spots, found in the Red Sea and the whole Indian Ocean.

Lupea sanguinolenta, Indian Ocean.

Platyonchus bipustulatus, *Latreille*. Length from two to five inches. It is found in the Indian Ocean.—*Eng. Cyc.*

PORUS. This was the name given by the Greeks to the race of the Puru or Paurava kings to which, in the time of Alexander, two princely races belonged. They were the first purely Indian race known to Europe. Porus is a corruption of Puar, once the most powerful and conspicuous tribes in India; classically written Pramara, the dynasty which ruled at Oojein for ages. The Porus who ruled in the direction of Hastinapura offered a determined resistance to Alexander with 4,000 horse, and 30,000 foot of the Kshetria tribe. They were defeated by Alexander's 11,000 virgins. In the time of Augustus Caesar, a letter in Greek praying for assistance was received at Rome from a king of this name, on the Indus. See Hindoo, Chandragupta, Kana.

PORSYA of the Baori, the Buck antelope, of Antelope Arabica, *Gazella bennettii*, *Jerdon*.

PORZANA BAILLONII, (*Crex baillonii*; 'Baillon's Crake,') of Europe, Asia to Japan, all Africa: exceedingly common in India.

PORZANA MARUETTA, (*Crex porzana*; 'Spotted Crake,') of Europe, Asia, N. Africa: common in India.

PORZANA PUSILLA, (*Crex pusilla*; 'Little Crake,') of Europe, N. Africa, W. Asia, Japan: Nepal, (*Hodgson*.)

POSEN, also *Feder kiel*, *GER.* Quills.

Sub-carbonate of potash, "	Khar,	PERIS.
Potassa, FR.	Potasch,	RUS.
Carbonate de potasse, "	Manu-uppu,	TAM., TEL.

Potash is a commercial term commonly applied to an impure carbonate of potash, obtained by the incineration of wood, lixiviating the ashes in barrels, first with cold, and then with hot water, filtering the ley, and evaporating it to dryness in an iron pot. This constitutes the potash of commerce, which is in hard irregular masses or fragments, of a light bluish gray colour, somewhat caustic alkaline taste, inodorous, and very deliquescent. Potash is of great importance in arts, being used in the soap and glass manufactures, the rectification of spirit, bleaching, in medicine, and for other purposes. It is procurable in most Indian bazaars. Apart from the question of exportation however, the ready and plentiful sources of both potash and soda in India is a question of great interest, especially in connection with the manufacture of glass and soap. This is prepared on the great scale by

subjecting to the action of flame crude or black potash, the black salt of American manufacturers. Instead of fusing it to make the potashes of commerce, the alkaline mass is transferred to a large oven-shaped or reverberatory furnace, where the flame is made to play over it; and being well stirred about, the black impurities are burnt out, and the mass becomes a caustic salt of a white colour with a tinge of blue, and constitutes the pearl ash of commerce.

Russian potash yields 772 parts of caustic hydrate; it used to be very impure, but is now more carefully prepared. The hindoos of the Malabar coast, as well as the Singhalese, who do not use Over Munnoo (impure carbonate of soda), in bleaching and washing linen, employ for these purposes, the ashes of burnt vegetables (chiefly cocoanut leaves), which can only, in this way, be of service, from the potash they contain. No manufacture of potash upon an extensive scale has ever been attempted in India. The common source of it is the ashes of land plants, and the English market is supplied from Russia and America. If attention were directed to the manufacture of this salt in India, it would form a very valuable article of export. A source of pearl ash, and one very interesting to us, seeing the enormous quantities of saltpetre all over the country, is nitrate of potash and charcoal, a sample of pearl ash from a refined saltpetre got from the Gunpowder Manufactory, and the gram plant, charcoal, also used in that establishment, was, after one crystallization, found superior to the best Russian or American article, giving by the alkalimeter 94 per cent. of pure carbonate. As this salt is obtained by the burning of vegetables, it must have been known at very early times. Dioscorides describes it as ashes of vine-twigs *Cineris lixivium* (Pliny xxxviii, c. 51.) The Arabs are usually supposed to have been the first to make known this alkali (al-kali); in countries where forests are abundant, as N. America, Russia, Sweden, Poland, wood is piled in heaps and burnt on the surface of the ground, in a place sheltered from the wind. The ashes which are left consist of a soluble and insoluble portion. The soluble part is made up of the carb, together with the sulphate, phosphate, and silicate of potash, and the chlorides of potassium and of sodium; and the insoluble portion of carbonate and sub-phosphate of lime, alumina, silica, the oxides of iron and manganese, and a little carbonaceous matter that had escaped incineration. In China, it is prepared by burning composite, polygonaceous and other inland plants. The ash is made into a thick mass by the addition of some kind of meal and is sold as an alkali for raising bread, cleaning clothes, &c.—*Royle, Hindoo Medicine; Faulkner; Ains. Mat. Med., p. 193; P. M. O. C.; Smith's Mat. Med.*

POTASH.

POTASH, bitartrate of

Bitartrate of potash,	ENG.	Potassæ bitartras,	LAT.
Supertartrate of potash,	"	Tartrate acide de po-	"
Cream of Tartar,	"	tasse,	FR.
Argol Tartar,	"	Doppelt-wein saures	"
Tartarum,	LAT.	kali,	GER.

This must have been known ever since wine has been made from the grape, in the juice of which it exists. During the fermentation of wine, sugar disappears and alcohol is formed, and the salt not being soluble in this, is deposited on the bottom and sides of casks, as a crystalline crust, which, according to the colour of the wine, forms either red or white tartar or argol. This was known to the ancients, and is the *Fæx vini* of Diosc., v, c. 13. Its nature was determined by Scheele in 1769. It is largely purified both at Montpelier and at Venice: in commerce it is in white crystalline crusts, formed of clusters of small crystals aggregated together, which are hard and gritty under the teeth, dissolve but slowly in the mouth, and have an acid and rather pleasant taste.—*Royle; Hindoo Med.*, p. 97.

POTASH, Nitrate of:

Abkir,	AR.	Shora,	DUK.
I-an dzeing,	BURM.	Nitre; Saltpetre,	ENG.
Siau-shiah,	CHIN.	Baji shora,	HIND.
Mangsiau,	"	Sandawa,	MALAY.
Yen-siau; Ho-siau,	"	Pottli uppu,	TAM.
Ti-shwang,	"		

This occurs as a natural product in Egypt, India and China, in the form of a natural white efflorescence of the soil. It is collected, purified by solution, filtration and crystallization. In this process, the soil is removed to the depth of about an inch, and treated with water, which dissolves the soluble salts. The solution is made in large basins or tanks; rapid evaporation takes place under the influence of the solar heat, and is completed by means of artificial heat: as the solution cools, a considerable quantity of nitrate of potash is deposited in large crystals. This forms rough Indian nitre. The mother-liquor is thrown away; but it contains a considerable quantity of nitrate of lime and magnesia, and might still furnish nitre if mixed with potash salts. Bengal and the neighbourhood of Patna are the sources of the largest portion of the saltpetre supplied to the European market from the Hooghly, but the Madras presidency furnishes large quantities of the best quality. In Hungary there are saltpetre pits, and in some parts of Spain the soil becomes incrustated with this substance. Nitre is also obtained from certain natural caverns occurring in the limestone rocks of the island of Ceylon: the walls become covered with a nitrous efflorescence, which is detached, during six months of the year, with picks, together with a small portion of the rock which contains felspar, and this is doubtless the origin of the potash. The fragments are pounded, mixed with an equal por-

POTATO.

tion of wood-ashes, and water is poured upon the mixture. The nitrates of the earths part with their acid to the potash in the ashes, and the earths are precipitated as carbonates of lime and magnesia. The clear decanted lie, containing the nitre of the ashes as well as that of the rock, is evaporated in pits exposed to the sun, and then in pans by the action of fire. The crude saltpetre, which crystallizes in cooling, is then fit for exportation. Similar caves exist in Italy, on the coast of the Adriatic, in North America, Africa, Teneriffe, &c. In France, nitre was formerly produced artificially in what are termed nitre-beds, by the oxidation of ammonia in the presence of a powerful base. Animal refuse of all kinds was mixed with old mortar, or hydrate of lime and earth, and the mixture was placed in heaps under a cover of some kind, to keep off the rain, but with free exposure to air. The heaps were watered from time to time with stale urine, and the mass was turned over in order to expose fresh surface to the air. When a considerable quantity of the salt had been formed, the mixture was lixivated, in troughs of oak-wood. The rough nitre as imported into Great Britain from the East Indies, is in broken crystals of a brown colour, and more or less deliquescent. The loss which it sustains in refining is termed the refraction, and can only be ascertained by analysis: but it is not easy to obtain a fair sample of a cargo. See Saltpetre.

The potato plant is a native of America but, since the early part of the eighteenth century it has been introduced into Europe, Africa, Asia, and Australia. Sir John Malcolm claims to have introduced it into Persia, about the early part of the 19th century. It was not grown by the Burmese up to 1862. Potatoes that had been sent to Cabul by Captain Wade, from Loodiana, had been planted by the nawab, and promised very well. In Persia they have long become common, having been introduced by Sir John Malcolm. Baron Hugel first introduced them into Kashmir, and sent them thence into Little Thibet. He forwarded since, two hundred rupees worth of potatoes, which were planted in the valley. In British India, the planting has been extending since the early part of this

century, but the root is still only used by Europeans. The Dutch and the Roman Catholic priests introduced it into China, where, also, the Europeans are the chief consumers. It is now largely grown in the Mysore, and in various parts of the Dekhan, by planting the tubers.

The potato plant belongs to the natural order Solanaceæ, and is closely related to the tobacco plant, belladonna, henbane, night shade, and other poisonous narcotics. In it, however, the poisonous qualities are confined to the parts above ground, including any of the tubers which may be exposed to the light in growing. It is a native of South America, and is still found wild in the mountainous regions of Chili, Peru, and Buenos Ayres. It has also been found in Mexico and in the Southern States, but was probably introduced there by the first Spanish settlers. Samples brought from the Carolinas were first grown by Sir Walter Raleigh in the south of Ireland in 1586. In that country, where both soil and climate are favourable to its growth, it rapidly came into favour; but in England, Scotland, and France a prejudice long existed against it, owing to the poisonous nature of the other plants of the same order, and for a century and a half it was only cultivated in flower-gardens. Even in 1725, the few potato plants in the gardens about Edinburgh were left in the same spot from year to year. In 1728, however, Thomas Prentice, a Scotch day-labourer, in Stirlingshire, began to cultivate the plant for food, and sold to his neighbours what he did not require for his own use. They bought willingly, and he soon made a small fortune, and lived for sixty-four years a happy witness to the effects of the blessing which he had been instrumental in conferring upon the country. In England the potato was taken into favour much earlier, and its field culture rapidly extended as its excellent qualities became known. A strange objection was at first made by some, who denied the lawfulness of eating potatoes because the plant was not mentioned in the Bible. In France it was not until a time of scarcity during the revolution that its culture became general.

Potatoes should be planted in rows about one foot apart and five or six inches deep; the space between each row, if ground can be spared, eighteen inches, otherwise not less than a foot. The ground should be light and loamy, and as little infested with white ants as possible. They can be sown at the commencement of the rains, and a spot should be selected where the water cannot lodge, but be easily let off; which may be done by keeping the end of the channel between the ridges open. At this season, plant on the top of the ridges, and do not water them unless necessary, as too much water makes them run to stalk. If the ground have not been

well ploughed previous to the rains setting in, and all the weeds destroyed, the chance is the crop will fail; but should the ground be ready, take the potatoes, intended for the seed, and cut them into pieces, taking care that each slice has at least two eyes in it; and as you cut the slices, whilst fresh, dip the cut side of each into wood-ashes, and let them dry well, which takes place in a few hours: this prevents the white ant's attacks. Sow each slice from nine to twelve inches apart, and place by the side of each a small clove of garlic, which in some measure tends to prevent the attack of a large grub very destructive to the plant. Dr. Riddell thinks this insect's eggs must be in the manure when added to the soil, and has little doubt but that if the manure was previously worked up with the soil two or three times during the hot season, and exposed to the heat of the sun, the eggs would be destroyed; or the same purpose might be effected with a little fresh lime. He is sure the caterpillar does not travel to the plant. The finest crops in the Dekhan are however sown from the beginning of October to the latter end of December, and this last crop will be found the most productive. Fine crops of potatoes have been grown where hemp has been first sown, and when about two feet high ploughed up into the ground. If, when the potatoes are about flowering, you perceive any of the stalks wither, carefully open the earth and look for a grub, which you may be certain is feeding upon it—of course destroy it. When these grubs are very numerous, it is necessary to search all the drooping plants daily: his idea is, that the larvæ is brought with the manure, and is the deposit of a beetle—however, nothing can be done but destroying them. He has heard recommended a bag with a small quantity of assafoetida to be placed in the water-course, as a remedy, when the plants were being irrigated. Another insect deposits its egg on the stalk of the plant. In the rains a small caterpillar eats its way into the stalk above the ground, when the plant immediately droops: the remedy is to remove the whole. Be careful at all seasons to keep the stalks well earthed up, and let the potatoes have a moderate supply of water—of course the season must be your guide. One year, at Kunhur, he raised a very fine crop of potatoes during the rains, by sowing them on ridges, and only watered them at first in consequence of want of rain: they were sown in the beginning of July, and a few taken up in the latter end of September. Some of the potatoes weighed from five to seven ounces, and were equal to any seen grown on the hills. In the latter end of August by way of experiment, he tore off shoots from the lower end of the stalks, when they were abundant, and planted them in rows, the same distance as for seed;

and in November, on taking them up, was gratified by finding four or five large potatoes produced by each stalk, the size of a duck egg. This plan he strongly recommends to those persons who may not be able to get fresh seed after the rains. He did not find that the rows of potatoes from which the slips were taken produced fewer potatoes in consequence, as he weighed the whole and kept a memorandum in his journal.—*Riddell*; *Canadian Naturalist*; *Vigne's Personal Narrative*, pp. 173-4.

POTATO-STARCH or Potato arrow-root, also called Potato-flour, forms a white and somewhat glistening powder, which crackles like genuine Maranta arrow-root, when pressed between the fingers. It is sometimes called British or English arrow-root, and is prepared by rasping and grinding the well-cleaned tubers of *Solanum tuberosum* into a pulp.

POTE. Glass beads.

POTEE, TAM. Round red cakes of cotton. An inferior kind is impregnated with the red colouring matter of the prickly pear, and a better kind is made by impregnating the cotton with the kaysur flower, the weeping *Nyctanthus arbortristis*, but the best is from the safflower, *Carthamus tinctorius*. The Potee forms a ready and durable substitute for red ink.

POTE-KA-LUCH'CH'HA, HIND. A necklace of strings of black glass beads.

POTEMKIN, see Kherson.

POTENTILLA, a genus of plants of the order Rosaceæ, of which several species grow or are cultivated in the East Indies.

- argentea*, L., Europe.
- atro-sanguinea*, Europe.
- denticulosa*, *Royle*, N. India.
- discolor*, *Jacq.*, Kanawar.
- inglisii*, *Royle*, N. W. Himalaya.
- leschenaultiana*, *W. & A.*
- micropetala*, *Don*, Nepal.
- mooniana*, *W. & A.*

Potentilla atrosanguinea, a herbaceous plant, is handsome when in flower: they grow in any garden soil, the colours of the species are various, and easily raised from seed, or by dividing the roots, the shrubby species grow from two to three feet high. *Potentilla denticulosa*, is common in the plains of Northern India in the cold season, at elevations of 4,000 to 5,000 feet in the Himalayas; two other species are found in the Neilgherries. *Potentilla discolor*, *Jacq.*, appears to be frequent in Kanawar, Spiti, and Ladak, from 11,500 to 15,000 feet. The under surface of the leaves is covered with a fine dust, which when the plant is shaken, causes violent sneezing.—*Drs. J. L. Stewart, M. D.*; *Riddell*; *Royle*, p. 202; *O'Shaughnessy*, p. 325.

POTENTILLA INGLISII, Royle.

var. P. fruticosa, L.

Spang, Jha, Merino, CHENAB. | Pinjung, Penma, LAD. Dr. Stewart says this is not uncommon in the

higher parts of the Chenab basin, where its fragrant leaves, &c., are used as a substitute for tea. It also grows in Spiti and Ladak, occurring in the latter up to over 10,000 feet. It is browsed by sheep.—*Dr. J. L. Stewart, M.D.*

POTENTILLA NEPALENSIS, Hook.

Rattanajot, SUTLEJ.

Dr. Stewart says this is not uncommon in the Punjab Himalaya at 6,000 or 7,000 feet. Its reddish root is exported to the plains, as one of the roots called rattanajot, but the roots of *Venca rosea*, L., and *Onosma echioides*, L., receive the same name. They are employed in dyeing wool, and are officinal, being considered depurative, and they are used externally in the Yunani system, the ashes being applied with oil to burns.—*Dr. J. L. Stewart, M.D.*

POTENTILLA TORMENTILLA.

Πενταφυλλον μελαν, Diosc. Theopr.

A native of Europe, and officinal; the root is very rich in tannic acid.—*O'Shaughnessy*, p. 325.

POTERAMMA, see Hindu or Hindoo.

POTERIE, FR. Earthenware.

POTERIUM SANGUISORBA, W. Common Burnet of Britain.

POTHU, HIND. *Elsholtzia polystachya*.

POTHU, a book, a Hindi or Sanscrit book.

POTHOS, of this genus of plants Wight gives *Pothos decursiva*, *heterophylla*, *officinalis*, *peep-la*, *pertusa*, *scandens*.—*W. & A.*

POTHOS OFFICINALIS, Roxb.

Scindapsus officinalis, Schott.

Gaj-pipul, *BENG.* | *Vushira, SANS.*

A large creeper, the fruit cut in thin transverse slices is the guj-pipul of the bazaars, and highly esteemed as a stimulant tonic.—*Roxb.*, ii, p. 101; *O'Shaughnessy*, p. 626.

POTLINGA, a god of the Gonds.

POTLI KHAKISTAR, a glass polisher used by glaziers, &c., &c.

POTLUPU, TAM., TEL. Saltpetre.

POTLUT, DUT. Blacklead. Potlut-Pennen, DUT. Blacklead pencils.

POT METAL, an alloy of copper and lead. It is improved by the addition of tin and the three metals will mix in almost any propor-

tion. Zinc may be added to Pot metal in very small quantity, but when the zinc becomes a considerable amount the copper takes up the zinc forming a kind of brass and leaves the lead at liberty, which in a great measure separates in cooling. Zinc and lead are indisposed to mix alone, though a little arsenic assists their union by "killing" the lead as in shot metal; antimony also facilitates the combination of pot metal,—7 lead, 1 antimony and 16 copper mix perfectly at the first fusion, and the mixture is harder than 4 lead and 16 copper and apparently a better metal.—*Holtzapfel's Mechanical Manipulation; Rhode's MSS.*

POTOOBAOLO, URJA? In Ganjam and Gumsur, a tree of extreme height 45 feet, circumference 4 feet, and height from the ground to the intersection of the first branch 12 feet. Occasionally used for bandy wheels and ploughshares. The leaves are eaten as a sort of vegetable by the hill people. Tolerably common.—*Captain Macdonald.*

POTOOR. A well in Ceylon which rises and falls with the tide. See Potur.

POTOWAR, a town containing remains of Greek sculpture.

POTRA, HIND., amongst hindoos a son begotten or adopted, amongst mahomedans, a grandson.

POT SAMMIONG, Lep. Arcetomys bobac, *Sch., Bly., Pall.*

POTSTONE.

Balpam, HIND.

A mineral which was used by the Romans in the manufacture of cooking-pots. It is found and worked in the Rajmahal hills, is extensively manufactured in the Himalaya. Captain Herbert wrote on it, in *As. Res.*, vol. xviii. Found under the laterite in the Concan, and manufactured all round Goa and Rajpore. Dr. Gibson gave a description of it, in *Bom. As. Trans.*, vol. i, 144, and Capt. Del Hoste in *Bom. Geo. Trans.*, 1848. Potstone is found in various parts of India, on the western coast, at Turreva Carey in the Madras presidency, and in the ghaut country betwixt the Phoonda and Ram Ghauts. It was known to the Romans, and is described by Pliny as used in the manufacture of vessels for cooking purposes—hence its name. The mineral possesses a glistening pearly lustre and greyish tint; it contains 49 per cent. of silica, 30 of magnesia, and 6 of alumina. The stone is prepared for use by reducing it to something like the form, size, and shape desired, by a cleaver, a panned hammer, or strong knife. When a cavity is meant to be circular, it is bored out by being held against the working spindle of a single-centred native lathe. This enables them to be held on by the chuck, when

they are chucked and finished in the lathe in the ordinary way. Potstone speedily hardens and darkens by exposure to the air: it absorbs grease, oil, or fatty matter, freely: it is stronger than ordinary earthen-ware, stands heat better, and is pretty extensively used for culinary purposes. That sold in the Bombay bazaar is mostly brought from Goa. Indurated potstone is obtained from the Mussaye quarries, on a spur of the Kymore range, at Chynepore, also from the Quindee quarries, from old red sandstone of the Rohtas Pass, in the Kymore range. This mineral is found in several parts of that range, and from some quarries can be had in large slabs, and in great varieties of colour. It takes a high polish, and might be used a great deal for ornamental work. Want of cheap carriage is against its being much worked. It is at present simply taken to Benares for the purpose of making images of gods for temples of private worship, or used locally. Although it has many of the qualities of, and is called, indurated potstone by Colonel Sherwill in his geological survey, he says it is not potstone, but rather a fine sandstone, stained of a dark hue, varying from greenish to dark brown (and, when polished back,) by some mineral oxide, and hardened by igneous action. It is a useful stone, and deserves to be better known.—*Cat. Ec.* 1862.

POTT, or Poti, a name of Buddha.

POTTA DELL. SINGH. A soft, coarse, open-grained, light Ceylon wood.

POTTA-PULLU. *Cyperus inundatus.*

POTTASCHIE, GER. Potash.

POTTER'S CLAY is abundant in many parts of Southern and Eastern Asia, is of various colours, chiefly reddish or grey, and becomes red when heated. Mixed with sand it is formed into bricks and tiles. The clay in which the petrified trees of Burmah are found has the appearance of fine potter's clay; and clays from the banks of the Ataran and Gyaing rivers were found, Mr. O'Riley says, after several trials at the Calcutta mint, to possess every good property of the best English fire clays.

POTTERY. The art of making vessels of baked earth, is alluded to in the book of Job, and is also repeatedly mentioned in other parts of the Scriptures. The potters of Samos were celebrated in the time of Homer; and great quantities of pottery have been found in Egyptian tombs, which, to all appearance, have lain unopened since the time of the Pharaohs. In all the cairns of the Peninsula of India, articles of pottery are found, and of the races who used thus form of burial there is no record. The fragments of pottery everywhere found among the ancient cities of India, as in those of other parts of the world, as Brogniart

has remarked, afford the best record of the early races of man, on the earth. In the exhibition of Indian pottery in 1851, numbers of the best judges greatly admired its elegant, even classical gracefulness of form. The clays which are generally employed in the more populous part of the country, contain so much oxide of iron and carbonate of lime that the vessels melt into a slag at a temperature little above that of redness. Deposits of a black stiff clay, containing much vegetable matter, occur in some districts; vessels made with it sustain a higher temperature. Clays capable of bearing great degrees of heat have, however, been discovered in different parts of India. As one great object is to have porous vessels for cooling water, the ordinary clays answer sufficiently well for this purpose; and some of the ware, as that of the tortoise shaped, expose a larger surface to the air. The hindoos, moreover, never use a polluted vessel, so no great expense will be incurred by them; thus, encouragement is wanting to improve the nature of their pottery. But very successful experiments have been made to improve the pottery in India, as by Mr. Julius Jeffreys, who succeeded in making stone ware, soda-water bottles, crucibles, fire bricks, tiles, &c., which seem to have been glazed by the silica uniting with the alkaline ashes of the furnace. Dr. O'Shaughnessy greatly improved the pottery in use in the dispensary of Calcutta, and which he glazed with the borate of lime. The glazed pottery of Pegu, of which two very large jars were sent in 1851, has long been known for its glaze not being affected by acids. Dr. Hunter sent some excellent specimens of pottery from the School of Arts at Madras, and for which a prize was awarded. The ancient potter's wheel is the instrument with which the hindoo works; and while it revolves, with the aid of his naked hands he fashions vessels of elegant forms, many of which have been admired as being of classical shapes, and some would appear almost as if they were of Etruscan origin: but there is no reason to believe that the hindoos have ever had anything but their own unerring taste to guide them. This beauty of form is equally conspicuous in the pottery of Sewan near Patna, as in that of Azingurh or of Ahmedabad, of Mirzapore, or of Moradabad. Some of it is remarkable, also, for its extreme thinness and lightness, showing the great skill of the artist, and making it difficult to understand how it kept its shape when in a plastic state, as it is not known that the turning-lathe is used to give a finish to any of the articles. The painted pottery of Kotah, and the gilt pottery of Amroha, have also been admired. The handles and the various ornaments of the Ahmedabad pottery are no doubt attached, as

in Europe, by means of slip. From the specimens of basket-work pottery sent, there is no doubt that, with better materials and a little instruction the natives could excel in this as in the forms of their pottery. If we had no other information, we might yet infer from the crucibles employed by the goldsmith, by the workers in brass, and by the makers of cast steel, that some very infusible clays are to be found in India; but recent investigations have proved that crucibles and firebricks, superior in infusibility to those made of Stourbridge clay, have been made in India; and from the white goblets of Arcot, and the light-coloured pottery of Madras, as well as from the white bricks sent from the Ceded Districts, we see that there are many useful clays without the usual admixture of iron. As connected with pottery might be mentioned the variously coloured Encaustic tiles, which have been used for the domes of some of the tombs near Delhi and Agra, as well as in Southern India; but it is not known that the art is at present practised. It was probably introduced by the mahomedans from Persia.

The Indian potter's wheel is of the simplest kind. It is a horizontal fly wheel, the frame of wood, the rim heavily laden with clay, two or three feet in diameter, weight sixty to eighty lbs., and is put in motion by the potter's hand, assisted by a stick; once set spinning, it revolves for from five or seven minutes with a perfectly steady and nearly true motion. The mass of clay to be moulded is placed on the centre of the wheel, and the potter squats before it on the ground. This machine has doubtless several defects; but it answers its purpose perfectly. The native furnace is simply an excavation in the ground of variable depth, in which the ware is placed layer by layer, with dry reeds, straw, &c., and all are burnt together. This rude system must of course give way to the European method, for the construction of all the superior kinds of vessels. The clays examined by Dr. O'Shaughnessy, occur in shapeless blocks, white, harsh to the touch, free from smell, absorb water with a loud hissing sound, and fall to pieces in slate-like layers. The moistened pieces are easily reduced to pulp under water. The earth is brown, easily reducible to pulp, very ductile and tenacious, exceedingly refractory, but burns to a deep brick colour. It gave good vessels as far as density and tenacity were concerned. By far the best clay he met with, was given by Captain Halsted, and which he procured at Singapore. It occurs there close to the beach, and can be brought to Calcutta for six annas the maund. The clay is found in thick strata. The detached masses are of a pink tint, broken into, they contain

POTTLUPU-DRAVAGUM.

nodules of perfectly white earth. They absorb water eagerly, and yield an exceedingly soft, ductile, and tenacious paste. Ooporomee or upper wash which may be described as a strong brown tenacious or clayey loam. The best is found at a village called Monad, ten coss west of Chinsurah, and at Panchdowkie, eight coss S. W. of Kulna. The raw earth is sold at four annas the maund; but the prepared ooporomee, is worth three rupees per maund. Three months are required for its proper preparation; and ten seers of ooporomee are procured from each maund of the raw earth. There are also two other sorts of varnishing earth, prepared from this ooporomee, which are called Gad, or scum, though it is obtained at the bottom of the washing vessel, and Majaree or middle sort. All these prepared specimens—belutti, ooporomee, gad and majaree,—are obtained by washing, great care being taken to select the water of a very pure tank, no doubt to avoid saline mixtures, which would act as fluxes. The belutti when prepared, is a mixture of the yellow ochre and alumina in slightly variable proportions. A fire-brick sent to the mint by Dr. O'Shaughnessy, was prepared from material raised near the river at Colgong, and consisting of three parts of Colgong Khari clay, and one part of fuller's saboon muttee.—*The Bengal Dispensatory and Pharmacopœia*, pp. 7-18; *Royle, Arts, &c., of India*, p. 478. See Porcelain.

POTTI, TEL. Short.

POTTI BUDAMA, or Kuturu budama, TEL. *Bryonia scabrella*, R.

POTTI CHANGALI? TEL. *Apluda aristata*, L.,—R. i 324. Changali is *Panicum ciliare*—Potti changali would be short changali—but *Apluda aristata*, though often short, sometimes attains a height of several feet.

POTTI DUMPA, or Adavi nabhi, TEL. *Gloriosa superba*, L.

POTTI GILI GICHCHA, TEL. *Crotalaria retusa*, Linn., Roxb.

POTTI GUMMADI, or Budade gummadi, TEL. *Cucurbita pepo*, L.

POTTI KAKARA, TEL. *Momordica charantia*, L. var. B.

POTTI KANUPU CHERUKU, TEL. *Saccharum officinarum*, L. var. The name signifies 'short jointed cane.'

POTTINGER, Sir Henry, Bart. a Bombay military officer, who was on the embassy of Sir J. Malcolm to Persia, afterwards Political Agent in Cutch and Sind, Plenipotentiary in China, Governor of Hongkong, and Cape of Good Hope, afterwards Governor of Madras 1848 to 1854. Author of *Travels in Beloochistan*, 1816, 1 vol. 4to.

POTTLOTH, also Reissbley, GER. Blacklead.

POTTLUPU-DRAVAGUM, TAM. Nitric acid.

POUK THEN-MA-MAYEK KYOUK.

POTTOLA, SANS. *Trichosanthes anguina*.

Potu tadi, or Tati chettu, TEL. *Borassus flabelliformis*, L.—R. iii, 790: Cor. 71; *Rheedei*, 10.

Potu vadla, or Madhavitige. TEL. *Hiptage madablota*, Gaertn.

Potu veduru, or Veduru gadda, TEL. *Bambusa arundinacea*, Willd. var.

POTUR, a well at Jaffna in Ceylon, about 30 feet in diameter and sunk to a depth of 144 feet. Its surface is of fresh water but deeper, it is brackish and salt, and on plunging a bottle to the extreme depth, the water it brings up is highly fetid and gives off bubbles of sulphuretted hydrogen gas. Its level rises and falls a few inches once in every twelve hours, but it overflows its banks and is never reduced below a certain level, however much water is abstracted. The natives believe that the well communicates with the sea at Kieremalie near Kangesentorre, a distance of seven miles from which they affirm, that a subterranean stream flows inwards. See Potoor.

POUDRE, FR. Gunpowder. Poudre a Puder, FR. Hair powder.

POUDRE DE COLOQUINTE, FR. Colocynth powder.

POUINDAH, A caste of traders.

POUK, BURM. *Butea frondosa*, also *Æschynomene paludosa*, *Æschynomene aspera*.

POUK NWAY, BURM. *Butea superba*, Roxb.

POUK-THA or Than-yen, BURM. Dr. McClelland reports probably *Inga bijemina*. Its maximum girth is 3 to 4 cubits, and maximum length 22 feet, abundant, but widely scattered, all over the Tenasserim provinces inland. When seasoned, it floats in water. It is an excellent and durable wood, would do well for handles of tools. This wood is of the same nature as Pyeng Khado (*Inga xylocarpa*), of which it is said to be a variety.—*Captain Dance*.

POUK THEN-MA-MAYEK KYOUK, BURM. A light coloured close grained wood of British Burmah, much prized by Burmans. A cubic foot weighs 58 lbs. In a full grown tree on

good soil the average length of the trunk to the first branch is 15 feet, and average girth measured at 6 feet from the ground is 5 feet.—*Dr. Brandis, Cal. Cat. Ex. of 1862.*

POUL, a copper coin of Bokhara, worth rather more than a farthing; in Georgian money it is the 10th part of a chahi.—*Simmond's Dict.*

POULU, a close woollen fabric manufactured in Thibet, of various qualities and colours, used for garments.—*Simmond's Dict.*

POULTRY, to keep it is an abomination to all but the lowest of hindoo.

POUN-YA, BURM. Acetic acid.

POUPARTIA MANGIFERA. Syn. of Spondias mangifera. *Pers.*

POUPEDYRÆ.—Bignonia chelonoides.

POURANIK, SANS. A follower of the pooranas.

POUVATTI MARAM, TAM. Nephelium longanum.

POVERASI, TAM. Santa Marie, Portuguese, called by Europeans Ceylon tulip tree, the Thespesia populnea, a tree, used at times by the coach makers for wheels, &c. It is generally planted to ornament walks in gardens, and is very common: it produces a yellow flower.—*Edye, on the Timber of Ceylon.*

POWANGHUR. Badamce fort was taken by storm on the 18th February 1818 and was again captured on the 10th June 1841, and as a continuation of the same, Punalla and Powanghur were captured on the 1st December 1844.

POWAR, MALAY. Cardamon.

POWAR or Puar, or Pouar, a section of the Rajputs.

POWAR KOTHUL, See Khyber.

PRABALA, SANS. Coral.

PRABANATHA. BENG. Seeds of Cassia tora.—*Ben. Phar.*

PRABASHA, a hill near ancient Kausambi, on the Jumna, about thirty miles above Allahabad. It is the only rock on the Doab of the Ganges and Jumna.—*Cunningham; Tr. Hind., Vol. i, p. 350.*

PRABHA, see Surya.

PRABBA CHETTU, or Prabballi chettu, or Neru prabba, TEL. Calamus rotang, *L.*; *Br. 711, "the rattan tree."*

PRABHAL, in lat. 18° 58' N., long. 73° 14' E., in the Konkan, 5 miles N. of Chock. The fort, is 2,320 feet above the sea.

PRABHAS-WARA, see Inscriptions.

PRABHAVAL, SANS. From Prabha, splendour, brightness. The glory figured around the heads of hindoo gods.

PRABHU, SANS. A lord or master, from which comes the Burmese word Prah or Phra. A term applied to the masters of hindoo sects.

PRABHUNATH, SANS. Cassia tora, *Linn.*

PRACRIT. *Dr. Caldwell, in his Com-*

parative Grammar, remarks that by the term Gaura or Gauda, are meant the Bhasha or Pracrit or vernacular tongues spoken in Northern India, some old ones of which have since ceased to be spoken, or have merged into others. At present the languages which may be considered Gaura, are Bengali, Hindi, with its neighbour the Hindustani, Punjabi, Gujarathi, Marathi, the languages of Kashmir and Nepal, altogether nine. See Gaura or Goura, Satarupa. See Prakrit.

PRAD, ENG. Horse.

PRADATCHANAM, see Hindoo.

PRAD'HAN, or Andh, a Goud tribe.

PRADHANA, in buddhism, is nature, or concrete matter. The Pradhanika are worshippers of universal nature as the sole First Cause of all things, an atheistical creed, preceding the teaching of Sakya muni.

PRADHOSHURATA, a fast observed by the Saiva sect of hindoo.

PRADOTYA, in hindoo mythological history, was brought down, by Sir William Jones, to B. C. 1029, the assumed epoch of Sakya, in Tibet and China. In his reign, the last Buddha appeared.—*Prinsep's Antiquities by Thomas, pp. 2, 14.*

PRADYUMNA, the incarnate Indian cupid, a son of Krishna. See Sri Sampradaya.

PRÆSTI, an ancient people governed by Portikanus, or Oxykanus, their capital Mahorta, probably the Oskana of Ptolemy. The name of Præsti given by Curtius might, according to Wilson, be applied to a people occupying the thals, or "oases," of the desert. He refers to Prastha, or Prasthala, as derived from sthala, the Sanscrit form of the vernacular thal, which is the term generally used to designate any oasis in Western India.—*Cunningham's Ancient Geog. of India, p. 261.*

PRAGBODHI MOUNTAIN, in Magadha, now the Mora Pahar.

PRAH, or Phra, see Prabhu.

PRAHLADA, a devotee of Vishnu, saved from the hands of Hiranya by Vishnu in his incarnation as Narasimha.

PRAHU, MALAY, a ship or lugger also written Prow. The boats of the Straits of Malacca, China, Archipelago are the Prahu, Sampan, Lorch, Pukat and Tongkong or Ting-King. In the Eastern Archipelago, the generic name for a boat or vessel, large or small, is Prahu, a word almost naturalised in the European languages. It belongs equally to the Malay and Javanese languages, and from these has been very widely spread to others, extending as a synonym to the principal Philippine tongues. The usual name for a canoe or skiff, both in Malay and Javanese, is sampan. The large vessels which the natives of the

Archipelago used in war or trade were called by them Jung, which is the word corrupted junk, that Europeans applied to the large vessels of the Chinese, of which the proper name is wang-kaug. For a square-rigged vessel or ship, the natives have borrowed the word Kapal from the Teling people. Names vary with forms of vessels, and the uses to which they are put, and these again differ with nations or tribes so as to be innumerable. The most common pirate vessels made use of among the floating communities from the Straits to the South-Eastern groups, are the penjajap and kakap, with paduakan, and Malay boats of various size and construction.

The penjajap is a prahu of light build, straight, and very long, of various dimensions, and carrying usually two masts, with square kadjang sails. This boat is entirely open, except that aft is a kind of awning, under which the headman sits, and where the magazine of arms and ammunition is stowed away. In front it carries two guns of greater or less calibre, of which the muzzles peer through a wooden bulwark, always parallel to the line of the keel. Penjajap of large size generally carry, in addition to these, some swivel pieces, mounted along the timber parapet; while boats of inferior tonnage are armed only with two lelah, elevated on a beam or upright. From twenty to thirty rowers, sitting on benches well covered with mats, communicate to the vessel with their short oars a steady and rapid motion, the more swift in proportion as the prahu is small. Large ones, therefore, are often left hidden in some creek, or little maze of islets, while the light skiffs flying through the water, proceed on their marauding errand.

The Kakap prahu is a small light boat, provided with a rudder oar, but with no other oars or sculls. It carries only one mast, with a single quadrangular sail. Like the penjajap, it is built of very buoyant timber, the planks being held together by wooden pins, and lashed with rattans. The pirate never goes to sea with a kakap alone, and the voyager may be sure whenever he descries a kakap, that a penjajap is not far behind, moving along, perhaps, in the shadow of the high coast, or lurking behind some island, or lying within the seclusion of some woody creek. Eight or ten of the best fighters are usually chosen to man these light skiffs, which remind us of those flying proas of the Ladrões described by a French voyager in a note to Sonnerat. In calm weather the pirates row in these buoyant galleys along the shore, or mount the small rivers, confiding in their agility, and knowing well that if surprised they may fly into the woods, bear their little skiff with

them, and launch it again at some spot unknown to their pursuers.

The Paduakan are native vessels having a single mast in the form of a tripod, and carrying a large lateen sail of mat. They are from twenty to fifty tons burden, and of great beam, with lofty sides, and little hold in the water. They are steered by two long rudders, which are lifted up when the vessel is moored or passing through a shallow.

The ordinary prahus made use of by the Malay pirates, at the present day, are from eight or ten tons burden, very well manned and exceedingly fast. Usually they are armed on the bows, centre, and stern with swivel pieces.

A second class, the Lanun pirate prahu of Mindanao, carries a crew of about 60 men. It has a stage or platform suspended to the mast, with grappling hooks attached to the end, which is used as a bridge for bordering a prize.

The first class Lanun pirate prahu of Mindanao carries a crew of 100 men or thereabouts. In this description of vessel, the tripod mast, the two after feet of which work on hinges, is used as a bridge in boarding.—*Kolff's Report*, 1831; *Earl's Voyage of the Donrigo*, Note 89; *St. John's Indian Archipelago*, Vol. ii, page 182 to 184. *Sonnerat, Voyage* p. 139.

PRAIT or Purehut, a stream in the Jubbulpur district near Jubbulpur.

PRAJA or Panja, SANS. *lit.* Progeny, offspring. The Praja of Cooch Bahar are cultivators almost in a state of serfdom. In Cuttack, the barber, washerman, fisherman, weaver, leather worker and tari gatherer are classed as Praja and often sell themselves and families into temporary slavery.—*Wilson*.

PRAJA PAT, a king, *Wilson*

PRAJA PATI, progenitors of mankind.

PRAJNA, in Buddhism, means wisdom, understanding, or foreknowledge. The author of the Ashta Sahariska thus addresses Prajna, "Thou mighty object of my worship! Thou Prajna, art the sum of all good qualities, and Buddha is the Guru of the world." The author of the Puja Kand thus addresses Prajna:—I make salutation to Prajna Devi, who is the Prajna Paramita (Transcendental Wisdom), the Prajna Rupa (multiform); the Nir Rupa, (formless), and the universal mother.

PRAJNA DEVI is deified Nature or Diva Natura, and the same as Dharma. In the physiological mythology of the buddhists, the universal mother, in the Kameshwari temple is represented by the Yoni, which is there a triangular stone. Adi Prajna or Dharma is the Prajna Devi, the Prajna paramita, the Prajna rupa, the Nir rupa and the universal mother. The wise make no distinction between thee and Budh. When all was Sangata, Prajna

Devi was revealed out of Akas (space) with the letter u. That Yoni from which the world was made manifest is the trikon akar jantra. In the midst of the Jantra or trikon is a binda (point or cypher) from that binda Adi Prajna revealed herself by her own will. From the sides of the triangle, Adi Prajna produced Budh and Dharma and Saugha. Adi Saugha, Amitabha, by virtue of his Santa Jayan, created the Budhi satwa named Padma pani and committed to his hands the lotus, the type of creative power. From Padma pani's shoulders sprang Brahma's forehead, Mahadeo his two eyes, the sun and moon, from his mouth the air, from his teeth Saraswati, his belly Varuna, his knees Lakshmi, his feet the earth. From the union of the essences of Apaya (Adi Budha) and of Prajna (Adi Dharma) proceeded the world, which is Saugha represented by the letter M.

PRAJAPATYA, Sans. The work of a prajapatee.

PRAJNA PARAMITA, see Prajñā.

PRAJNANATH, see Inscriptions.

PRAKAT, or Rakat, also Parakat, Parkat, MALAY, Gluc.

PRAKKE CHETTU, or Pakke chettu, also Pabbe, Tamarix gallica, L.

PRAKRIT, or Prakrita, is a term given to a dialect of the Sanscrit, it is the common, the enchorial and not the perfect language. In this sense, the common dialect of any spoken language is a Prakrit. See Praerit.

PRAKRIT, see Kali, Sacta, Siva.

PRALHAUD, see Avatarum, Narasinga or Man-lion Avatar.

PRAMARA, one of the four Agnicula Rajput tribes. The thirty-five Sachæ of the Pramara are—

Mori, of which was Chandragoopta, and the princes of Cheetore prior to the Gehlot.

Soda, Sogdi of Alexander, the princes of Dhat in the Indian desert.

Sankla, Chiefs of Poogul, and in Marwar.

Khyr, Capital Khyraloo.

Oomra and Soomra, Anciently in the desert, now mahomedans.

Vehil or Bihil, Princes of Chandravati.

Maiparout, Present chief of Bijolli in Me-war.

Bulhar, Northern desert.

Kaba, Celebrated in Saurashtra in ancient times, a few yet in Sirowi.

Omuta, The princes of Omutwarra, in Malwa, then established for twelve generations. Omutwarra is the largest tract left to the Pramara. Since the war in 1817, being under the British interference they cannot be called independent.

Rehar, Dhoonda, Scruteah, and Hurair, Grasia petty chiefs in Malwa.

The Pramara, though not, as the name implies, the 'chief warrior,' was the most potent of the Agnicula. He sent forth thirty-five sachæ, or branches, several of whom enjoyed extensive sovereignties. 'The world is the Pramara's,' is an ancient saying, denoting their extensive sway; and the 'No-kot maroost'—halli signified the nine divisions into which the country, from the Sutlej to the ocean, was partitioned amongst them. Maheswar, Dhar, Mando, Oojein, Chandrabhaga, Cheetore, Aboo, Chandravati, M'how Maidana, Parmavati, Omrakote, Bekher, Lodurva, and Puttan, are the most conspicuous of the capitals they conquered or founded. Not one remnant of independence exists to mark the ancient greatness of the Pramara; ruins are the sole records of their power. The prince of Dhat, in the Indian desert, is the last phantom of royalty of the race. He is the descendant of the prince who protected Hamayoon, when driven from the throne of Timoor, and in whose capital, Omrakote, the great Akbar was born. Among the thirty-five sachæ of the Pramara the Vilil was eminent, the princes of which line appear to have been lords of Chandravati, at the foot of the Aravalli, but of the dynasties issuing from the Agnicula, many of the princes professed the Buddhist or Jain faith, to periods so late as the mahomedan invasion.—*Tod's Rajasthan, Vol. i, pp. 92-93.*

PRAMATHIA NATIL, see Inscriptions.

PRAN, HIND., *Eremurus spectabilis*.

PRAN, in hindoo belief, a spiritual element, of which there are twelve. The hindoo believes that on the clearness and firmness of his spirit at the last moment, when all is growing dim before him, hangs his chance for the world beyond. His life ebbs away, the eleven pran, or spiritual elements, gliding from him, ascend the precipitous banks of the dark Bhaoasagar river. The twelfth pran—the spirit of life—still flutters within him. The eleven fore-runners, as they stand on the awful brink, survey beneath a vast chaos of animal shapes and forms. If the twelfth which they have left behind can remain placid and calm, the eleven may have a brief moment's respite to choose from among the ghastly through the form into which they shall migrate. The choice made, the angel of death from behind precipitates them into the abyss where, joined by their twelfth mate, they enter the chosen tabernacle. And thus, with a last struggle, the spirit passes away.—*Pioneer*.

PRANAM, a hindoo form of salutation, consisting of a slight inclination of the head, and the application of the joined hands to the forehead.

PRANAYAMU, Sans. From prana, life.

and ayama, a coming. The exercises of pranayama or breathing through either nostril alternately, and then closing both during the repetition mentally of certain formulæ.—*Hind. Theatre*, p. 195.

PRANGMADANI, MALAY. Carpets.
PRANGOS PABULARIA, *Lindley*.

Fitrasulium, Pushtu.
Petrasoleum, "

Prangos, Pushtu.
Komal, "

Grows in Cabul and on the trap hill of Ahatong in the Kashmir valley, but the Kashmirians do not value it. This plant constitutes excellent fodder for cattle, fattens quickly, and destroys the "liver fluke" of sheep. Royle considers this one of the plants which yielded the Silphium of Alexander's historians. It was discovered by Moorcroft, in Tibet, and found by him to be employed as winter fodder for sheep and goats, and frequently for neat cattle. Moorcroft writing from the neighbourhood of Draz, describes the Prangos hay plant as producing fatness in a space of time singularly short, and likewise as being destructive to the liver fluke; he therefore justly concluded that it would be an invaluable acquisition to any country to the climate of which it was suited, as its highly nutritious qualities, its vast yield, its easy culture, its great duration, its capability of flourishing on lands of the most inferior quality and wholly unadapted to tillage, impart to it a general character of probable utility unrivalled in the history of agricultural productions. When once in the possession of the ground, for which the preparation is easy, it requires no subsequent ploughing, weeding, manuring, or other operation, save that of cutting and of converting the foliage into hay. Various attempts were made to introduce the Prangos hay plant into Great Britain, but unsuccessfully; and it is probable it will only succeed, and be valuable in a climate similar to that where it is found indigenous. The Prangos is highly valued in the cold and arid region of Tibet, where it is indigenous. It is found in Tibet, and also most abundantly on Ahatong, a low trap hill in the valley of Cashmere; but there it was not so vigorous as in its Tibetan habitat. Though abundant in various directions, the Cashmerians do not esteem it of any value, and Dr. Falconer is of opinion that its importance has been much over-estimated, in consequence of its being the only food in many of the bleak and barren tracts of Tibet. In Cashmere, where far from a deficiency of herbage there is actually a superabundance of pasture grasses, it is necessarily much less esteemed. The Prangos will, therefore, most probably be a valuable acquisition only in countries devoid of good natural pasturage and

of which the climate is favourable to its growth. In Kashmir, it is used in decoction to cure the rot in sheep. The leaves are used as fodder for sheep, they are rather heating. The native name "fitrasalyun," is probably a corruption of "parsley." Royle states that Lieut. Burnes crossing in the direction of Alexander's route found this plant, "the prangos," greedily cropped by sheep.—*O'Shaughnessy*, page 369; *Moorcroft in a letter to W. Butterworth Bayley, Esq., formerly Chairman of the Court of Directors*, Vol. v, p. 179; *Royle's Pro. Res.*; *Powell's, Hand-book*, Vol. i, p. 352. See Graminaceæ.

PRANHITA, the name of the united streams of the Wardha and Wainganga up to their junction with the Godavari. On the Pranhita and Godavary river, the Mahratta and Teling races meet.

PRAN-NATHI. These are also called Dhami, disciples of Pran Nath, who lived the latter part of Aurungzeb's reign, and composed Mahitariyal, with a view to combine the mahomedan and hindoo religions. They eat together and admit the gods of each other's religions, but do not make any other departure from the customs of their ancestors.

PRANNE KORENJA, Rus. Spices.

PRAN-PRALAP. There arose in Nadiya in the beginning of the 16th century, a reformer who was destined to wield immense influence on the masses. Chaitanya flourished during the time of Kasinatha, and when Sayyid Hussain Sharif of Mecca reigned in Gujur under the title of Sultan Ala-ud-din Husain Shah, Sharif of Mecca. It was when Luther was thundering against the indulgence and other abuses of the christian church, that Chaitanya preached a new doctrine. That doctrine was the efficacy of Bhakti or faith as contra-distinguished from works. It was an innovation on the Vedic system, which inculcates specific religious duties and the performance of ceremonies and acts. This Bengali reformer taught that all men are capable of participating in the sentiments of faith and devotion, and that the members of all jati or castes became pure by such sentiments. He maintained the pre-eminence of faith over caste. The mercy of God was according to him boundless, and not circumscribed by the restrictions of tribe and family. He declared that Krishna was Paramatma or the Supreme Spirit, prior to all worlds, and both the cause and substance of creation. In his capacity of Creator, Preserver, and Destroyer, he is Brahma, Vishnu, and Siva: Chaitanya became the founder of the largest religious sect in this country, mustering nine to ten millions strong, and fortified by an elaborate organization. Its disciples are to

be found in almost every village in Bengal. They include some of the wealthiest and most influential families, as well as a host of poor and obscure men. Having obtained the sympathy and support of a large class, Chaitanya now openly declared it was his mission to go forth and preach the love of Krishna as the one thing needful for salvation. But the Krishna of Chaitanya was not the son of Debaki, the intended victim of his uncle the tyrant Kansa, the sojourner in Brindaban, the companion of cowherds, the lover of Radha, the favourite of milkmaids and flower women, the terror of husbands, and afterwards the conqueror of Kansa and king of Dwarka; but the Creator of the universe, and the God of truth, justice, mercy, and love. His Krishna was the great and original Spirit, the Author of creation and the Giver of all good. The age of Kasinatha and his successors was eminently favourable to the reception of the religious tenets he offered to it. The country had undergone great political and social changes. The character of the hindoos had been moulded during some time by mahomedan conquests, mahomedan intercourse, mahomedan laws, and mahomedan literature. Their minds were at this time fermenting with religious longings to which the doctrine of Bhakti inculcated by Chaitanya answered in many ways. A more practical religion than Vedantism, and a purer religion than Bhavanism, was eagerly looked for. It is therefore not to be wondered at that the religion of Chaitanya soon took root in Nadiya, which reverberated with the name of Krishna. Young men and old men of that city gathered round him, among them was Adaitanandan, who was to him what the Baptist had been to the greatest religious reformer. He addressed them all in a tone of authority and affection, telling them that Krishna was the Saviour, and that they must love him with all their hearts and with all their souls. His preaching was generally heralded by convulsions and fainting fits. This phenomenon was called by his disciples Pran-pralap, and continued for hours. During its continuance he forgot all mundane affairs and exclaimed ever and anon Krishna, Krishna. This ecstatic state of Pran-pralap was attended with mystic sighs and songs of Haribol. It was contagious among his disciples and became a conspicuous trait of the new sect. Chaitanya was a mystic. Eating but little and caring nothing for the animal man, he was able to maintain a state of continued excitement. This cerebral and muscular debility contributed in no inconsiderable degree to bring about those alternations of deep sorrow and intense joy, which told so

much upon his audience and by means of which he swayed tens of thousands. Chaitanya thought or rather felt that the first and greatest of all works was faith in Krishna. From this all other works must spring. He announced this as a mighty message of joy, message that thrilled through the hearts of his hearers. He preached that the Chandala whose impurity is consumed by the chastening fire of holy faith, is to be revered by the wise, and not the unfailing expounder of the Veda. Again, "the teacher of the four Vedas is not my disciple. The faithful Chandala enjoys my friendship, to him let it be given, and from him be received; let him be revered even as I am revered." This doctrine was the efficacy of Bhakti or faith as contradistinguished from works. Religious rites and ceremonies were in the opinion of Chaitanya not essentially important, but the appreciation of them by the generality of mankind, and their adaptability to the spread of religious tenets, were fully realised by him. With a view to perpetuate distinctiveness of his sect and society, and establish an indissoluble bond of union, he insisted on his followers submitting to the initiatory rite of the Mantra. It consisted in the guru or spiritual guide whispering in the ears of the Sishya (disciple) the mystic words "Kling Krishna." Another observance enforced by Chaitanya among his followers was the eating of the prasad by them together. A common meal has always been understood to cement and ratify relations of friendship. The brotherhood of the Vaishnava sect was symbolized in the prasad. It was a communion where all the followers, without distinctions of caste, were admitted on equal terms. There was the learned Naiyāik as well as the illiterate Chasa, the mahomedan Rais as well as the mahomedan Mahut, the Kulin brahmin and the Kulin Kayastha as well as the aboriginal Bagdi and the excommunicated Chaudal, all participating in consecrated rice and dal and malpua. It was a manifestation of an intimate fellowship between those who shared in this common meal. It is now manifest that one of the distinguishing features of Chaitanya's theocracy was the universal character of the sect he founded. That sect was recruited from all classes of the hindoo as well as the mahomedan community. No one who desired to enter was refused. To all who knocked at the door admittance was granted. Chaitanya kept an open house and his guests represented all classes, not only of society but of humanity. Chaitanya was most child-like in disposition and character. He was essentially guileless and simple-minded, but a most large-hearted man: and it was in his preach-

ing that he poured out the wealth of that heart. He became a king of men on the Bedi or pulpit which constituted his throne. His sermons were to the hindoos of Bengal, what those of Savonarola were to the Florentines. Like the Italian reformer he was fervid and forcible. Chaitanya was fond of travelling and became an itinerant preacher. In the course of his peregrinations he came to Ramkali, situated in the suburbs of Gaur, the then capital of Bengal. He delivered there a magnificent sermon. Striking the harp and hymning the praise of Krishna, he touched a chord which resounded and vibrated through Bengal. His utterances were aglow with intense fervour. Thousands of people came to hear him, and the sensation he made was so great as to attract the attention of the king Syed Husain, who deputed an officer to enquire into the matter. The officer reported that the noise had been made by a Sanyasi, and that it was not worth while taking further notice of the matter. But he continued to preach, and all classes of men from all parts of the great city crowded to Ramkali. Among those who had come to hear him preach were two mahomedan brothers Dabir and Khashi, holding high employ in the Court of Gaur. They were in fact ministers of Syed Husain and enjoyed his entire confidence. They were enraptured with the eloquence of Chaitanya, and became converts to the doctrine of Bhakti; they longed to see him in private, learn at his feet the tenets of the new faith. Accordingly they went to his cottage at midnight and thus addressed him. Purifier of the fallen, low in descent, and occupation, we are afraid of speaking our minds to thee. Saviour of Jagai and Madhai, have mercy on us. Of Mlechha descent, these sinners are incomparably more odious than those lordly brahmins of Nadiya. Our race has sinned greatly against cows and brahmins. We are dwarfs standing on tiptoe to catch the moon. Stoop in mercy towards us." Chaitanya cordially received them and assured them of their salvation. "Krishna will save you—henceforth you shall be known to the world under the names of Rup and Sanatan." The reception of two mahomedan nobles evinced a moral courage of no common order; which, while it showed Chaitanya's deep conviction of the purity and popularity of his faith, afforded conclusive evidence of his extraordinary boldness in disregarding the injunctions of caste and race, and his intention to build religion on the fatherhood of God and the brotherhood of man. It must be remembered that the convert brothers were members of a court which was intolerant of hin-

dooism, and served a king who, claiming as he did, direct descent from the prophet, was particularly aggressive against its doctrines. This act, therefore, was calculated to enlist against the reformer, not only the active antagonism of the king and the court of Bengal, but the hostility of the hindoos who had been accustomed to regard the mahomedans as Mlechhas, association with whom, in a hindoo religious point of view, is contamination. He, however, fully expected his disciples to cast aside all antiquated prejudices, and above all, and beyond all, to have faith, which he rightfully applied as the true test of training in Vaishnavism. He was emphatically what the Germans call an epoch-making man; representing some of the best elements of hindoo thought and hindoo character, and illustrating in himself the strength and weakness of hindoo theology. His object was grandly catholic. It was to rebuild hindoo society from its foundation, to exterminate priestcraft, to eradicate the evils of caste, to introduce religious toleration, to assert the right of equality of man, and to establish the relations of his fellow-beings on the principle of a universal brotherhood. A fanatic and a mystic, Chaitanya never deviated from his appointed course; and the immense influence he had acquired over the hearts of his followers, he applied to the furtherance of no personal objects, but of that religion to which he had consecrated his life and his energies.—*Calcutta Review*, No. 109, pp. 100 to 102.

PRANU NIRODHA, Sans., from prana, life, and nirodha, to stop.

PRAONG, see Himalaya.

PRASADA, Sans. Amongst the Sikh and Vaishnava sects, means a distribution amongst the assistants of sweetmeats which have been consecrated to the idols. Prasada in the hindoo religion, is an article of food, consecrated by previous presentation to an idol, after which it is distributed amongst the worshippers on the spot, or sent to persons of consequence at their own homes. It was the prasadh or meat offered to idols from which in Acts xv. 29, the followers of the Christ Jesus were told to abstain. But 1st Corinthians x, 25, says, 'Whatsoever is sold in the shambles, that eat, asking no question for conscience sake.' In Orissa, the people buy the boiled rice which has been offered to Jagannath, and all the different castes eat of it together, as an act of merit: the same conduct in Bengal would make them out-castes. The buddhists of Burmah also throw away the offerings and at the great Shooay Dagon at Rangoon and the Prome temple, Shooay-San-Dau, vast heaps of boiled rice are thrown over on the rocks. Most hindoos eagerly seek whatever has been

offered to an idol; hence it is common to see flowers which have been thus offered, placed in the hair of a hindoo. Water that has been thus made sacred is preserved in hindoo houses, and with it they rub their bodies, and occasionally sip a drop, regarding it as the water of life. It has been remarked by the celebrated Goguet, that the custom of offering food to the object of divine homage had its origin in a principle of gratitude, the repast being deemed hallowed by presenting the first portion to him who gave it, since the devotee was unable to conceive aught more acceptable than that whereby life is sustained. From the earliest period such offerings have been tendered; and in the burnt-offering (holocaust) of Abel, of the firstling of the flock, and the first portion of the repast presented by the Rajput to Anadeva, 'the nourisher,' the motive is the same. But the prasada (such is the denomination of the food sacred to Kaniya) is deemed unlucky, if not unholy; a prejudice arising from the heterogeneous sources whence it is supplied—often from bequests of the dead. The Mookhia servants of the temple accordingly carry the sacred food to wheresoever the votaries dwell, which proves an irresistible stimulus to backward zeal, and produces an ample return. At the same time are transmitted, as from the god, dresses of honour corresponding in material and value with the rank of the receiver, a diadem, or fillet of satin and gold, embroidered; a dughla or quilted coat of gold or silver brocade for the cold weather; a scarf of blue and gold; or if to one who prizes the gift less for its intrinsic worth than as a mark of special favour, a fragment of the garland worn on some festival by the god; or a simple necklace, by which he is inaugurated amongst the elect. Kaniya ki kanti band' hna, 'to bind on [the neck] the chaplet of Kaniya,' is the initiatory step. At the present day, christians of no sect make any food-offerings to idols. The Hebrew races however, as also the mahomedans only partake of the flesh of such animals as have been made lawful food by being prayed over before being killed. This is called amongst mahomedans Halal karna, to make lawful, and a mahomedan recites the words Bismillahi, Allahu-Akbar. Otherwise, it is haram, unlawful. In the name of the Lord to God, the great. In the butcher shops of the towns of Europe, where the Hebrew races reside, there is a mark put on the animals which have been made lawful food.

Mr. Mayhew, in his work on "London Labour and the London Poor," after speaking of the Jew butchers of Whitechapel, says: "The slaughterers I saw were quiet-looking and quiet-mannered men. When the animal is

slaughtered and skinned, an examiner (also appointed by the synagogue) carefully inspects the 'inside.' 'If the lights be grown to the ribs,' said my informant, who had had many years' experience in this branch of the meat trade, 'or if the lungs have any disease, or if there be any disease anywhere, the meat is pronounced unfit for the food of the Jews, and is sent entire to a carcase butcher to be sold to the christians.' Meat that is fit to eat is distinguished by a leaden seal, stamped in Hebrew characters with the name of the examiner, and the word Koshar meaning lawful. Meat killed according to the Jewish law is known as "coshar," while that killed in any other fashion is called "tryfer."

There is no restriction, however, which, as it appears to us, would be likely to have a stronger influence upon the culinary art of the Jews than the injunction, three times repeated in the Scriptures in the same words, "Thou shalt not seethe a kid in his mother's milk." Exodus xxiii, 19, and xxxiv, 26, and Deuteronomy xiv, 21). The utmost caution and care have been used in carrying out both

letter and the spirit of this injunction. It was extended not only to the flesh of all animals, but to any process which could, in its widest acceptation, be included under the term "seething," or whatever may be its Hebrew equivalent. And further, every precaution was taken to remove the possibility even of an admixture of the two elements. Particular vessels had to be used for dressing flesh and others for milk; and so, too, there was a complete separation required for dishes, plates, knives, forks, and so forth. No vessels of wood or earth might be purchased at second-hand, and those of metal or stone had to be well scoured with hot ashes or scalded in boiling water before it was considered proper to employ them in the preparation of food. The hindoo races are even more stringent than the Hebrew and many of the vaishnava sect do not allow a stranger to see the cooking.—*Tod's Rajasthan, Vol. i, p. 529.* See Hindoo.

The prawns, shrimps, crab, crawfish, and other kinds of crustacea are abundant, and palatable. One species of Chinese crawfish, as large as but not taking the place of the lobster called lung hai, or dragon crab, cuttlefish of three or four kinds, and the large king crab (*Polypheumus*), are all eaten by the Chinese though not relished by others.—*Ains. Mat. Med.*, p. 155.

PRAY. The Manu Manau tribe are called by the Red Karen, Pray, they dwell between the Sgau and Red Karen.

PRAYAGA, the modern Allahabad, also called Pratihthana, is described in ancient hindoo writings, as at the confluence of the Yamuna and Ganges on the bank of the latter: it would seem, therefore, so late as the composition of the drama of the Hero and the Nymph, that that ancient city still stood opposite to its present site. The ruins, according to Hamilton, are still to be seen at Jhusi on the left bank of the Ganges. Allahabad or Prayaga was a holy place, having been the seat of Bharadhwaja

hermitage; but it never was a city until Akbar made it one. The name of Prayaga is recorded by Hwen Thsang in the seventh century, and is in all probability as old as the reign of Asoka, who set up the stone pillar about B. C. 235, while the fort was not built until the end of the sixteenth century. Hwen Thsang makes the district of Prayaga about 5,000 li, or 833 miles, in circuit; but as it was closely surrounded on all sides by other districts, General Cunningham reduced it to 500 li, or 83 miles, and limits the district to the small tract in the fork of the Doab, immediately above the junction of the Ganges and Jumna. It was at Prayaga, the well-known place of pilgrimage, at the junction of the Ganges and Jumna, that Akbar built his fort of Allahabad, or Allahabad, as it was afterwards called by Shah Jehan. There still is the famous tree called Akshay Bat, or undecaying Banyan tree. This tree is now situated underground, at one side of a pillared court, which would appear to have been open formerly, and which is, he believes, the remains of the temple described by Hwen Thsang. The temple is situated inside the fort of Allahabad, to the east of the Ellenborough barracks, and due north from the stone pillar of Asoka and Samudra Gupta. According to the common tradition of the people, the name of Prayag was derived from a brahman who lived during the region of Akbar. The story is, that when the emperor was building the fort, the walls on the river face repeatedly fell down, in spite of all the precaution taken by the architect. As the old city of Prayag has totally disappeared, we can scarcely expect to find any traces of the various buddhist monuments which were seen and described by the Chinese pilgrims in the seventh century.—*Cunningham's Ancient Geo. of Ind.*, pp. 388-90; *Tr. Hind.*, Vol. i, pp. 207, 317; *Hindu Theatre*, Vol. i, p. 207; *The Hero and the Nymph*; *Hamilton's Genealogies of the Hindoos*. See Lat.

PRAYANGU, see Inscriptions.

PRECIOUS OPAL, see Opal.

PRECIOUS STONES. Gems and precious stones are the same minerals, but amongst lapidaries, the term gem is generally applied to the better variety. Amongst scientific mineralogists, gems and precious stones are distinguished and classed according to their chemical composition, their hardness and their specific gravity, but lapidaries and jewellers name gems according to their colours, rather than with reference to their chemical composition or their relative degrees of hardness and density. Thus the

PRECIOUS STONES.

corundum ruby, (oriental ruby) spinelle or others are all, when red, called ruby; if green, emerald; if blue, sapphire; and if yellow, topaz. Oriental is a term applied to the finest gems whether found in the east or not. The ancients called the most highly-coloured stones, masculine, and those of more subdued tints, feminine, and according to Pliny, the ancients included under the term gems, all stones of beautiful colours which were found in small quantity and of a sufficient degree of hardness to be engraved as seals. According to the moderns, gems are those stones which in a small compass, combine hardness and fire or lustre, with vivid soft or agreeable colours, and divide them into two classes, real gems or jewels and precious stones. The real gems are the

Diamond,	Topaz,	Essoinite,
Sapphire,	Zircon,	Corallierite,
Ruby,	Garnet,	Iolite,
Spinelle,	Chrysoberyl,	Cyanite (sapphire),
Emerald,	Tourmaline,	Chrysolite, of Rock
Beryl,	Rubellite,	crystal varieties.

Precious stones are supposed to possess the same characters as the gems only in a minor degree. They are also generally only translucent or semi-transparent and occur in large amorphous masses. The precious gems commonly seen are—

Emeralds,	Amethysts,	Beryl,
Pearls,	Sapphire,	Precious opal.
Rubies,	Topaz,	
Diamonds,	Avanturine,	

The course of trade has been so devious from time to time that obscurity long prevailed as to the native countries of the precious stones. The localities in Coimbatore, which supply the beryl, are also supposed to have yielded the emerald, though Tavernier was not able to ascertain that any part of India, in his day was yielding emeralds. Tavernier says (p. 14), "as for emeralds, it is a vulgar error to say they came originally from the east. And therefore when jewellers and goldsmiths do prefer a deep-coloured emerald inclining to black, tell ye, it is an oriental emerald, they speak that which is not true. I confess, I could never discover in what part of our continent those stones are found. But sure I am, that the eastern part of the world never produced any of those stones, neither in the continent, nor in the islands. True it is that since the discovery of America, some of those stones have been often brought rough from Peru to the Philippine Islands, whence they have been transported into Europe; but this is not enough to make them oriental. Besides that, at this time they send them into Spain through the North Sea."

That the lands in the east have generally

PRECIOUS STONES.

been supposed to be the chief gem-producing countries is also shown by the fact that Europa designates the most valuable of them oriental—oriental amethyst, oriental emerald, oriental topaz, oriental aquamarine.

Chemically speaking, the diamond, the most precious of all stones, is a mere crystal of carbon; the others, with certain exceptions, are mere crystals of clay. These clay crystals take different names according to their colours. When red, the crystal is called a ruby; when blue, a sapphire; when purple, an amethyst; when green, an emerald; when yellow, a topaz; but all these varieties represent one and the same stone; in fact, the colours pass into one another almost indiscriminately. It is not always, for instance, that the red or blue distinctly predominates. It requires a very pure ruby to be of a perfect red, and an equally pure sapphire to be of a perfect blue. Frequently the colours run more or less into one another, so that each stone shows a touch of purple. Thus the amethyst, though ranked as a particular species of stone, is but a stone in which the colours of the ruby and sapphire are blended. Sometimes the colour itself will vary with the light. In the International Exhibition of 1862 there was shown a stone of some historical importance, called "the marvellous sapphire," because, though of a pure blue by day, it became a deep purple by candle-light. Many sapphires, however, have the same peculiarity, and it is considered in the trade, not a recommendation, but a flaw. The scientific name for the ruby class is the "corundum," but only the red and blue corundums are commonly seen, the green and yellow corundums being extremely rare. When found, they are styled, for distinction's sake, the "Oriental" emerald and topaz, the ordinary topaz and emerald being different stones altogether, and brought to us, not from the East, but mostly from Brazil. An "Oriental" emerald, or, in other words, a green corundum, and, similarly, a yellow sapphire or a purple sapphire, would be of a far finer quality and higher value than the stones going by that name in the trade. Information from Melbourne assures us that these rare varieties of the corundum are among the gems there discovered, so that, besides obtaining an increased supply of diamonds, we shall receive specimens of jewels hitherto all but inaccessible. White sapphires and green sapphires are specially enumerated among the stones already brought to light, and as the discrimination between the two classes is, in skilled hands, both easy and infallible, there should be little danger of mistake. As far as we can judge, and as far as is actually judged on the spot, the Austr-

fish mines do produce these precious varieties, and are therefore richer than the mines of Brazil. Brazil produces diamonds in abundance almost incredible, but they are rarely of high quality or large size. All the more valuable stones, whether diamonds or corundums, come from the East, and many of them, perhaps, came hundreds or even thousands of years ago. The famous diamond mines of Golconda have long ceased to be productive, and it is impossible to conjecture how long its products may have been in circulation. Precious stones, it should be remembered, are absolutely indestructible. Some of them, like the Koh-i-Noor, have a history of many centuries, and there is no reason, indeed, why the very stones set on the breastplate of the Jewish High Priest should not be in existence still. Gold and silver disappear constantly in prodigious quantities through various processes of industry, but a gem can never be worn out, and it is worth nobody's while to destroy it. The very finest specimens, indeed, are all known as accurately as the most famous paintings, and even the less valuable stones pass in endless circulation from one class or one country to another. A few years ago some of the best diamonds in England, including even the celebrated Burgundy diamond, were exported to Bombay on the orders of the Parsee merchants enriched by the cotton trade. Then came the financial collapse, and the precious gems, after thus returning to the land from which they came, were once more re-exported to Great Britain. Gems are not purely or solely articles of luxury. Diamonds are largely used in trade, and will be employed, perhaps, still more extensively if their price should fall. Rubies and sapphires, too, are required in the manufacture of watches; and it is probable that a material which, besides its brilliancy and beauty, possesses the quality of extreme hardness and durability, will be turned in other ways to useful account. In fact, the diamond trade at present is, as regards the production of new diamonds, mainly regulated by the demands of industry. The imports from Brazil consist of thousands upon thousands of small stones required for the glazing and other trades, the additions made to the more valuable specimens being extremely small. To this is due the extraordinary rise in the price of jewels during the last twenty years. When the gold discoveries, in conjunction with other causes, suddenly increased the public wealth, there was no corresponding increase in the gems which wealth is naturally employed to purchase. Instead of one customer who could give 500*l.* for a diamond, there were at least a dozen, and diamonds rose in the market accordingly.

Quartzose minerals were not commonly known in ancient times and hence were extravagantly esteemed. Pliny tells of Polycrates, the wealthy tyrant of Samos, who, to buy off the ill-will of fortune dropped a sardonyx (quartz variety) into the sea! The story goes that it fell into the mouth of a fish, which shortly afterwards was served upon the royal table (a very common eastern legend this) and was thus restored to the owner. Some years ago it was said to have been found when digging in the vineyards of Albano. Of course a stone with such a history is precious. Pyrrhus is said to have had an agate marked with the figure of Apollo and held to be of countless value. This was probably a mocha stone, which nowadays fetches high prices if the patterns strike the buyer. Hence also moss stones cost from one to three rupees each while ordinary Cambay stones are sold by the dozen. It is fancy, not intrinsic value, which fixes the price here. There is in the British Museum a quartz stone bearing the traditional likeness of Chaucer, every feature being perfectly marked. It is simply priceless to Englishmen. But those who know not Chaucer—would value it only for its singularity, and ask you not more than Rs. 60 for it. And it was just because of their peculiar markings and because of their rarity in the markets that the ancients so inordinately prized "agates." Even so late as mediæval times, the amethyst and diamond were of equal value! In India the most valuable of all the gems is the diamond. It occurs in alluvial deposits at Cuddapah, Banaganpilly, &c., in the river Kistna also in the bed of the river at Sumbulpore in the district of the Mahanuddy river and at Panna in Bundelkhand. Corundum from its coarsest states to its finest in the form of the oriental ruby, emerald, topaz, and sapphire occurs in the granite and syenite districts. The spinel ruby is also a native gem, as likewise zircon which occurs in alluvium in the Ellore district. Schorl occurs in the granite and syenite districts. Chrysalite is an inmate of the secondary trap. Precious garnet, pyrope garnet and grenatite garnet are met with in primitive tracts of country, as also rock crystal and various beautiful amethyst and cat's eye and many kinds of cornelian jaspers and agates are also natives of the peninsula of India. The annual value of cornelian exported from India formerly amounted to £10,000. The secondary trap rocks afford beautiful and splendid specimens of the elegant zeolite family. In the southern districts of the Madras presidency, where the corundums occur, coloured stones are abundant, but it is not known if stones of any value were ever found there.

In the southern part of Ceylon is an ex-

tensive group of mountains rising to the height of 7,000 or 8,000 feet, which, with successive falls diminish till they rest on the alluvial plains of the low country. The S.W. face of this group forms a bold range, crowned at its western extremity by Adam's Peak called by the people Sri-pada or Holy foot, and at the eastern end of the range is Kirizalpota which rises in abrupt precipices to 8,000 feet above the plains. Ratnapoora, or city of Gems, is in part of this range. It is about 60 miles from Colombo, and about 200 feet above the level of the sea. It is the centre of the gem-producing district, which extends about fifty miles along the base of this mountain range, and in this district, comprising Safragam and the Three Korles, the search for gems is a regular occupation of the people, in the beds of streams and in the alluvial plains lying in the valleys, upon their banks. The gems found in this locality are the sapphire, the ruby and the topaz; the cat's eye, amethyst and beryl, and the spinel ruby is also found but is more rare. They are found in a layer of gravel, fifteen to twenty feet deep to which they sink a foot, and if they meet with a thin hard crust of ferruginous stones or masses of milk quartz, such are always favourable signs. The oriental ruby or red variety of corundum, is very rare: when pure in water and colour it is very valuable. The blue variety of corundum is the oriental sapphire, is in greater abundance but of inferior value, and its colours greatly vary, from the deepest velvet blue to the palest and almost imperceptible tint even losing all tint and becoming colourless, and in that form is a very beautiful gem, remarkable for its whiteness and the absence of prismatic colours. The yellow variety of corundum is called the oriental topaz which is of every shade of yellow, and when pure it is highly valued. But, many stones have a milky opalescence which makes them valueless. When the red and blue are mixed in the corundum the stone is called oriental amethyst. Half a stone will be red and half blue. The Ceylon ruby has occasionally a blue tint, which can be expelled by heat. The opalescence occurs in rubies, sapphires and topaz. When such stones are cut *en cabochon*, at a certain angle to the axis, they form the star stone, showing in a strong light a star of six rays, very pretty as a fancy stone, but of no value as a gem.

Tourmaline occurs abundantly in Dindigul and in Ceylon, in colours black, brown, blue green, red, white and colourless, and exhibit a dichroism. Some beryls are quite colourless, but the colours are generally blue or yellow. The finest beryls are described by

Pliny as those 'qui viridatem post maris imitantur,' which are of a clear sea-green colour, hence, crystals of clear tints of sea-green or sky-blue are called Aquamarinas or Aquamarines. The beryl occurs in considerable abundance at Kangium in a southern collectorate of the peninsula of India, and is largely worn by hindoo men as an ear-droop. Corundum occurs in great abundance in several districts of Mysore, in the Hyderabad dominions, in several taluks of Guntoor, in Rajahmundry, Indore, Cnttack, Coimbatore, North Arcot, Salem, and Madura collectorate, and, it is said, also in Travancore. This is the hardest of all known minerals except the diamond. The name corundum from the Tamil korund is commonly confined to the opaque rough crystals and cleavable masses, generally of dingy-colours and often dark, while the term emery embraces the more or less impure, massive, granular and compact kinds. Sapphire, emerald, topaz and ruby comprise the transparent, brightly-tinted varieties of corundum. Emerald crystal is hexagonal, colour green passing into light-blue, impure yellow, and white for the beryl. Lustre vitreous, sometimes resinous. Transparent to subtranslucent. Streak white, brittle. Fracture conchoidal, uneven. H. 7.5 to 8.0, S. G. 2.67 to 2.732. Analysis of emerald of Muzo:

Silica... ..	68.0	Magnesia	0.9
Alumina.....	18.1	Soda.....	0.6
Glucina... ..	12.2	Tantallic acid ..	trace.

traces of chromium are reckoned with the magnesia, and perhaps there is a little titanlic acid with the alumina. The emerald was believed by the ancients to be excellent in its virtues. It was supposed to be good for the eyes, on which account they were in the habit of wearing it, about their persons engraved as a seal, that they might have it to look at. The largest known emerald is the property of the Duke of Devonshire, which was brought to England by Don Pedro. It measures two inches in length and 2½, 2 and 1½ inches across the three diameters. It is a six-sided prism, weighing 8 oz., 18 dwts., but there is a small piece of quartz attached to it, which would diminish that weight by 3 or 4 dwts. Owing to flaws it is but partially fit for the purposes of the jeweller. It was obtained from the mines at Muzo. A smaller but more splendid specimen in the possession of Mr. Hope, cost £500 and weighs 6 ounces. Emeralds of less beauty but of larger size are found in Siberia. A specimen in the Royal collection measures 14½ inches in length and 12 inches in breadth, and weighs 16½ lbs. troy, brightly-

coloured varieties of corundum, if blue, are generally called Oriental sapphire; the red, oriental ruby; the transparent or translucent yellow or white, oriental topaz; the green, oriental emerald; the violet, oriental amethyst; the hair-brown, Adamantine-spar; the asteriated crystals, Asteria; when transparent, with a pale reddish or bluish reflection, Girasol sapphire; with pearly reflection, Chatoyant or opalescent sapphire.

Oriental amethyst is a lilac-blue or violet variety of corundum.

Oriental chalcedony is a name sometimes applied by lapidaries to the finer kinds of cornelian: occidental chalcedony, on the other hand, being used by them to denote the softer and less brilliant varieties of a yellowish-red colour.

Oriental chrysolite is a name given by lapidaries to yellowish-green corundum.

Oriental emerald is a corundum of a greenish-yellow colour, tending more or less to olive.

Oriental garnet is a blood-red or dark crimson garnet.

Oriental hyacinths of jewellers are rich reddish-brown varieties of corundum; and also hyacinth of a hyacinth-red or deep red colour with a tinge of brown, and sometimes of orange-yellow.

Oriental opal red of jewellers are the finest kinds of precious opal.

Oriental peridot are varieties of a greenish-yellow colour, verging on olive.

Oriental ruby, fine red varieties of corundum.

Oriental sapphires are blue transparent varieties of corundum. When perfect, of a clear, bright prussian-blue colour and possessed of a high degree of transparency, this stone is valued next to the oriental ruby. It is, however, seldom found in this state, being more frequently pale blue, passing by degrees into entirely colourless. Pale varieties when exposed to a strong heat entirely lose their colour without undergoing any other alteration and have often been sold for diamonds.

Oriental topaz is a variety of corundum of a yellow colour more or less mixed with red. The most esteemed colour is a bright jonquil-yellow, and next a pure lemon-yellow. It is a very beautiful stone, though inferior in value to ruby or sapphire.

The ruby is imitated by Spinel, from which it is easily distinguished by superior hardness. The finest stones are found in the sand of rivers in Ceylon, in the sand of certain streams, and in the Capelan mountains near Syrian, the capital of Pegu and in Ava, but they are guarded most jealously from Europeans. They are described in the Journal of the Asiatic Society of Bengal, (vol. ii, p. 75.)

they are about 60 to 70 miles from the capital, in a north easterly direction.

Sapphire, is found in the same earth with the rubies of Burmah but are much more rare, and generally of a larger size. Sapphire occurs crystallized in variously terminated six-sided prisms, and in rolled masses, and is found in the beds of rivers or associated with crystalline rocks. It possesses double refraction, and becomes electric by friction. Is not acted on by acids, and remains unaltered by the fire, red and yellow varieties if anything, being improved in colour by heating. Sapphire is chiefly brought from Ceylon and Pegu, but it is also found in Bohemia in France, in the Brook Rionpezzoulou, near Expully in Velay and in New South Wales.

In Prinsep's "Oriental accounts of the Precious Minerals," it is stated that under the name of sapphire or yaqut are comprised all those stones of the sapphire and ruby species, which are distinguished (or rather connected, as being chemically one) by the epithet Oriental, in English books of mineralogy, and are now classed together under the general head of Corundum, because they are composed of the same earth, alumina, as the corundum, or karund of India. The natives, like European mineralogists, distinguish four principal species of yaqut, red, (Oriental ruby) blue (oriental sapphire); yellow, white, or colourless, (oriental topaz), and green (oriental emerald.) Blue sapphire is imitated with iolite, kyanite, &c., hardness affords the best test of the genuineness of the stone. The word sapphire is derived from sappeiros, the name of a blue stone amongst the ancients. Most probably the sappeiros of the ancients, however, was not our sapphire, but Lapis lazuli. Spinel may be readily distinguished from the oriental (or sapphire) ruby; for which it is often sold, by inferior hardness and specific gravity, and also by its crystallization. A fine stone, of 20 to 30 carats is worth from £8 to £16. There is considerable incertitude, according to Prinsep, concerning this gem amongst oriental authors. Jewellers in the east apply the term *lal* to all rubies, of a fine red colour, but the *lal rumani* (scarlet or pomegranate ruby,) is probably the true spinelle. The bright-red spinelle ruby, *lal rumani*, is called by modern jewellers as *yaqut naram* or simply in Hindustani, *narmah* also *labri*, it comes from Pegu and Ceylon, and less frequently from the north. Modern physicians ascribe the same medicinal properties to spinelle as to the oriental ruby.

Under the general term ruby, lapidaries class several stones of very different chemical composition, &c., which they dis-

tinguish chiefly by their colours. Thus when of a full carmine-red it is known by the name of spinel ruby, when the tinge verges upon rather pale rose-red it is called Balais or Balas ruby, when the red has a decided shade of orange it usually goes by the name of Vermeil or Vermeille, when of a yellowish-red it is called Rubicelle. The ruby is considered by jewellers to approach perfection the more closely it resembles the colour of pigeon's blood. The name ruby should, however, be restricted to the oriental ruby, or the red varieties of corundum. The ruby is generally set in rings and brooches, surrounded with brilliants. It is stated in Prinsep's "Oriental accounts of the Precious Minerals," that not to be deceived in rubies is a work of difficulty, because there are spurious ones of polished crystal which much resemble the true gem, these are called Ayn-ul-rajan, but a skilful lapidary will easily recognise them. When placed in the fire a true ruby becomes invisible, but when immersed in water it appears to glow with heat.

Rock crystal can be dyed. If made red hot, and plunged repeatedly into the tincture of cochineal, it becomes a ruby; if into a tincture of red sandal, it takes a deep red tint: into tincture of saffron, a yellow like the topaz; into a tincture of turnesol, a yellow like the topaz; into juice of uerprum, it takes a deep violet like the amethyst and into a mixture of tincture of turnesol and saffron it becomes an imitation of the emerald. Steeping the crystal in oil of turpentine saturated with verdigris or spirits of wine, holding dragous blood or other coloured resins in solution, depth of tints are produced proportioned to the time of steeping. Crystal can be coloured if heated in a crucible with orpiment and arsenic. Crystal coloured red as false rubies are known in France as Rubaces.—*King*, p. 178; *Bristow's Mineralogy*, pp. 40, 97, 126, 325; 330; *Taverner's Travels*, p. 144 *London Times Newspaper*, *Prinsep's Oriental Accounts of the Precious Minerals*. See Cam-bay, Gems, Ruby.

PREM DEVI. It was a saying of Bhishma that where a son does not exist, the daughter should occupy the throne. Prem Devi was on the throne of Delhi before the mahomedan invasion. In Nepal three females reigned at different times. Rajendra Lakshmi is described as a "woman of extraordinary character and talents." In Ceylon several ranis reigned from time to time. In Rajputana females governed as regents. Col. Tod, speaking of the Boondi queen says—"Her sentiments showed invariably a correct and extensive knowledge, which was equally

apparent in her letters, of which he had many. At present (1873) the Begum of Bopal is reigning."—*Calcutta Review*, pp. 43, 109.

PREM SAGUR, a hindoo paraphrase of the Bhagavat purana.

PREMNA, a genus of plants, of the natural order Verbenaceæ, and tribe Viticeæ. There are 36 species of Premna known, of which the following are of the East Indies.—

esculenta, Roxb., Chittagong.
barbata, Wall., Bengal, Nepal, Kumaon.
latifolia, Roxb., Coromandel.
longifolia, Roxb., Bengal, Khassya, Assam.
herbacea, Roxb., Bengal.
procumbens, Moon., Ceylon.
spinosa, Roxb., Bengal.
hircina, Buch., Mauritius, Bombay, Moluccas.
scandens, Roxb., Kandalla, Sylhet.
grandifolia, Wall.
cordifolia, Roxb., Kandalla, Penang.

------------	------	--------------------	------

A shrub or small tree, common in India, the timber is only useful for the most common purposes. On the Bombay side the shrub is rare, save about the ghaut heads. The leaves have a very unpleasant odour when pressed in the hand, but used by the natives in soups and curries. Root warm and bitterish, given in decoction as a cordial and stomachic: decoction of the leaves used in colic and flatulence. The root has a somewhat warm and bitterish taste, an agreeable smell, and is prescribed, in decoction, as a gentle cordial and stomachic in fevers, and on other occasions requiring medicines of this nature.—*Voigt*, *Gibson*, *Wight*, *Jaffray*, *Rheede*, *O'Shaughnessy*, 486; *Ainslie's Mat. Med.*, p. 90; *M. E. J.* See Vegetables of Southern India.

PREMNA LATIFOLIA, Roxb.

The tree.

Nelli chettu, TEL.

The greens.

Nelli-kura.

| Peddi-nelli-kura.

A small tree of the Coromandel coast, wood white, firm, and used for various economical purposes. Flowers during the hot season, the leaves have a pretty strong though not disagreeable smell, and are much used in curries by the natives.—*Mr. Rhode's MSS.; Voigt.*

PREMNA MUCRONATA, Roxb.

Bankar,
Ganhila,

BEAN, RAVI | Gian,
CHENAB.

RAVI.

A tree which occurs in the Siwalik tract to 3,000 feet up to the Ravi.—*Dr. J. L. Stewart, M. D.*

PREMNA PYRAMIDATA, Wall.

Kyoon-na-lin, BURM.

A small tree of British Burmah; wood strong, used for weavers' shuttles. A cubic foot weighs lb. 52. In a full-grown tree on good soil, the average length of the trunk to the first branch is 30 feet, and average girth measured at 6 feet from the ground is 5 feet. *Dr. Brandis' Cal. Cat. Ex., 1862.*

PREMNA SERRATIFOLIA, DC.

Munne-kéray, TAM.

Leaves used similar to those of *P. integrifolia*. The natives are very fond of them. *Jaffrey.* See Vegetables of Southern India.

PREMNA SPICATA, *Burm.* Syn. of *Premna spicigera, Linn.*

PREMNA SPICIGERA, Linn.

ANGLO-TAM. Nagool,

Nagara chettu, TEL.

A small tree of Coimbatore, the Bombay ghauts, the Godavery and the Northern Circars. It has a pretty looking wood, hard and close-grained, of a brownish yellow-colour, well fitted for ornamental purposes, more a fancy wood, than a timber, and is rather scarce; the natives use the sap in some of their ceremonies.—*Wight, Rhode.*

PRENG, JAV. Bambusa. The bamboo.

PRENKHANAMU, SANS. Prenkhanpu chettu, or Kadamba, TEL. Nauclea cadamba, R.

PRESBYTIS, *Illiger*, a genus of monkeys, the Semanopithecus of Cuvier, the Langur and Hanuman monkeys of the hindoos.

P. entellus, Bengal Langur.

P. schistaceus, Himalayan "

P. priamus, Madras Langur

P. johnii, Malabar "

P. jubatus, Neilgherry "

P. pileatus, Blyth, Sylhet, Cachar, Chittagong.

P. barbei, " Tipperah hills.

P. obscurus, Reud, Mergui.

P. phayrei, Blyth, Arakan.

P. albocinereus, Malay peninsula.

P. cephalopterus, Ceylon.

P. ursinus, Blyth, "

P. maurus, Java,

P. melalophos, Sumatra.

Mr. Ogilby, in his 'Natural History of Monkeys,' alludes to the bezoars reported by many travellers to exist in the stomachs and intestines of the Asiatic monkeys, as confirmatory of Professor Owen's views; and adds that the bezoars produced by the monkeys of the Malay peninsula, and which can scarcely belong to a genus different from the Semnopithecus, are described as being smaller, rounder and more powerful in their qualities than those obtained from ruminating animals. There are known six species of Simiadae in Ceylon, reckoning as one, the mountain representative of *Pr. cephalopterus*.

Semnopithecus nasicus of Borneo, the Proboscis monkey or long-nosed monkey has a prominent nose. It is exceedingly rare in the collections of Europe.—*Low's Sarawak, p. 80.*

PRESBYTIS ALBINUS, *Kelaart*, all white, with a dash of grey on the head; face and ears black; palms and soles flesh-coloured. Rare: seen about Kandy in parties of three or four.

PRESBYTIS ANCHISES, *Ell.* Syn. of *Presbytis entellus*.

PRESBYTIS CEPHALOPTERUS, *Zimmerman*, occurs in Ceylon. It is a most gentle creature, has the body black slightly grizzled; croup, tail, and exterior of thighs, albescent, palest on the croup and end of tail; head rufescent-brown, a little tinged with blackish on the sides, and the whiskers and short hair on the chin and lips of a dull white conspicuously contrasting. A specimen sent by Dr. Templeton is of a uniform dark brown-colour, passing to dusky on the hands and feet, the head rather paler and more rufescent, and the whiskers and hairs of the chin and lips whitish, the croup outside of thigh and tail are comparatively but slightly paler and albescent. The skin of a male sent by Mr. Jerdon (procured also in Ceylon, to which the island species seems to be restricted) is marked as in the others, but is of a much lighter and rufescent brown-colour, darker on the hands and feet, the croup and tail are fulvescent whitish, its crown and especially the long hair of the occiput are paler than the back. The general colour of this last specimen is indeed that which is confined to the head only of black individuals, while in Dr.

Templeton's live specimen the usual colours are nearly blended into uniformity, the white whiskers, however, remaining the same in all as well as the circumstance of the croup and tail being much paler than the rest and more or less albescent, the tip of the latter being usually whitish or sullied white. Dr. Kelhart designates as a n. s. *Pr. cephalopterus*, var. *b. monticolus*, and the native name he spells *Kallu wanderu*.—*Mr. Blyth's Report*.

PRESBYTIS PRIAMUS.

Kondo wanderu, SINGH.

Is not confined to the low country in the north. They are seen skirting the Kandyan hills and occasionally on the hills. Trincomalee is full of them.

PRESBYTIS THERSITES.

Elle wanderu, SINGH.

It is found in Ceylon lower down in Bintenne, and in the Wanniy district. It was considered identical with *Pr. priamus* of the eastern and western ghats of the peninsula, the Ceylon Hoonuman, but a glance at the living animal suffices to show its distinctness from that and the several other species which have been confounded under *Pr. entellus*. At Mr. Elliot's suggestion, it may be designated *Pr. thersites*, *Elliot*, (*Pr.*—fig. 3.) Adult male inferior in size to that of *Pr. entellus* (verus) of Bengal, Orissa, and Central India, of an uniform dusky-grey colour (devoid of fulvous tinge) on the upper parts, darker on the crown and forelimbs, and passing to dull slaty-brown on the wrist and hands; the hair upon the toes whitish or dull white; no crest upon the vertex (as in *Pr. priamus*;) nor does the hair there form a sort of transverse ridge (as in the living *Pr. entellus*): face surrounded with white, narrow over the brows, the whiskers and beard more developed than in the other entelloid Indian species and very conspicuously white, contrasting much with the crown and body, which are darker than in *Pr. priamus* (as was a smaller specimen examined formerly). The strongly contrasting white beard is indeed the most striking feature of this Ceylon species, as compared with its near congeners.—*Blyth's Report*.

PRESBYTIS URSINUS, *Blyth*., usually seen in large numbers jumping on the trees, and when disturbed they make a peculiar short howling noise. One was known to have attacked a cooly on a coffee estate carrying a rice bag. The malabars eat the flesh of this monkey, and consider it very delicious food, and some Europeans who have tasted it are of the same opinion.—*Elliot*; *Tennent's Sketches of the Natural History of Ceylon*, p. 62; *Mr. Blyth's Reports*.

PRESENTS IN JAPAN. There are three articles which, in Japan, always form part of an Imperial present. These are rice, dried fish and dogs. Some also say that charcoal is always included. Why these should have been selected, or what they particularly symbolize, is not known.—*American Expedition to Japan*, p. 429.

PRESERVES, &c. The Chinese candy many things which are not considered fit for such purposes elsewhere, as millet seeds, bamboo shoots, slices of the lily root, &c., these are hawked about the streets. Ginger root, preserved in sugar, is the most common sweetmeat exported; it is made of the tender roots of the ginger plant (*Zingiber officinalis*), and when good has a bright appearance, a dark-red colour, and is somewhat translucent. If the roots are old, the conserve will be stringy, tough and tasteless. Much of this kind of sweetmeat is carried to India for consumption there, and for re-exportation to England and the continent; the export to the United States is considerable; also to Sydney; South America, &c. Other kinds of conserves, as whampee, gnava, and pear, jelly, citron, kumquat, oranges, &c., &c., are also sent abroad; the total exportation may be put down at 10,000 boxes, value about £50,000. A box is estimated at 25 catties. In India the mango, apple, pear, melon, quince, lemon, amla (*Emblia officinalis*), lalala (*Beleric myrobalan*), carrot, ber, ginger, are all made into preserves and conserve of red capsicums. There are preserves also of lemon, bokhara plum, limes, tomato, rhubarb, cherry (gila, sara siya), apple, quince, pear, peach and watermelon.—*Hon'ble Mr. Morison's Compendious Descriptions*.

PRESIDENCY is the term by which, in India, the respective seats of governments, such as Calcutta, Madras, and Bombay, and the territories ruled over, are known. It has its origin in the circumstance of the governments being there conducted by a council, the governor for the time being, holding the office of president.

PRESTER JOHN. Aung khan, of the Keraite Mongols, celebrated in Europe under the name of Prester John, or Presbyter John, was a contemporary of Changez Khan, whom, at the instigation of jealous enemies, he attempted, but failed, to destroy. He was of the christian religion, cotemporary with the emperor Alexius Comnenus of Constantinople, to whom he addressed a letter descriptive of his power. So many fables have been related of him that his very existence has been doubted. But many particulars of this letter are confirmed by Marco Polo, Sir John Mandeville and others. In that letter he des-

cribed himself as a christian, ruling over the three Indies, from the furthestmost, where Thomas is bound, to Babylon. These were divided into 72 provinces some of them christian and each with a king. He mentions that he had vowed to visit the sepulchre of our Lord with a great army, and that his army was preceded by 13 crosses of gold and precious stones. Dr. Oppaert in an essay read before the Ethnological Society, describes Prester John as a title of four Tartar sovereigns or Kaitach belonging to the Kitai Tartar, and of the name Yeliutashe, who defeated the sultan Sanjar. The last of the princes who took this title of Prester John was named Kushluh who reigned 1213 to 1218, and was defeated and slain by Changrez Khan.—*Layards Nineveh, Vol. i, p. 251; Elliot, p. 498; Dr. Oppaert.*

PRESENTAS, PORT. Hams.

PRETA, a spirit, Preta sraddha, the first years obsequial ceremonies to a deceased person, there are fifteen preta sraddha. See Hindoo.

PRETYA BHAVA, SANS. In the hindoo Veda, a life after death is not frequently alluded to, and it is more for the goods of this world for strength, for long life, a large family food and cattle, that the favor of the gods is employed. Pretya-bhava, often rendered the condition of the soul after death means really the state on earth. The present life, according to Indian notions is Bhava, birth and growth: Pretya, after a previous death.

PRETA-RAJ, SANS. Preta is a ghost, and raj signifies raja.

PRI, HIND. *Desmodium argenteum*, and *D. tiliaefolium*.

PRIAPATIUS, or Phriadatius, see Cabul.

PRIAPUS, LAT., see Linga.

PRICKLY VANGUERIA, Vangueria spinosa, Roxb.

PRIDE OF CHINA, Melia bukayun, Royle.

PRIDE OF INDIA, Melia azedarach, Linn., DC., Roxb., W. Ic.

PRIESTS. Every brahman who professes a knowledge of the formula of his religion may become a priest. They are distinguished by the appellations, Purushita, the Acharya, the Sudushya, the Brahma, and the Hota. The first appears to be the principal ceremonial, the last the sacrificial, priest. According to Mr. Ward, the first mentioned is the most advantageous order, as the rich, who are unwilling to fast, bathe in cold water and perform further ablutions and sacrifices, bestow fees upon the Purushita to perform these ceremonies for them. Some of the lower castes, as the five artizan castes and all the Non-Aryan races, have priests of their own, and not brahmans. Hindoo priests have no official garments, but always appear in their usual dress. The buddhist priests or gelum of Ladak wear the usual red loose robe, adorned with amulets and strings of beads, cloth boots of divers colours, and a praying-box in the hand, "which they keep revolving like a child's rattle, now stopping to listen to our interpreter's request regarding provisions, then (as it to make up for lost time), setting to work to grind his prayers with redoubled energy."—*Cole., Myth. Hind., p. 392; Adams.*

PRIMATES, an order of Mammals, comprising man and the monkeys; viz.

ORDER—Primates.

Fam. Simiadae, Monkeys.

Quadrumana, | Catarrhinae, *Geoffrey.*
Hæpithæci, *van Haven.*

Sub-fam. Simiinae, Apes.

Troglodytes niger, Chimpanzee, Africa.

Troglodytes gorilla, Gorilla, Africa.

Simia satyrus, Orang-utan of Borneo.

Simia morio, Orang-utan of Sumatra.

Sub-fam. Hylobatinae, Gibbons of Indo-Chinese countries and Malayan.

Hylobates hoolook, Hoolook of Assam, Cachar, Khassya and Sylhet.

Hylobates lar, Gibbon of Tenasserim.

Hylobates agilis, Gibbon of Malay peninsula, others from the Malay Islands.

Monkeys.

All over Southern India.

PRINCE'S FEATHERS.

Macacus piliatus, *Shaw*, of Ceylon.

Macacus carboarius, *F. Cuvier*, of Burmah.

Macacus cynomolgus, *Linn.*, of Burmah.

Fam. Lemnridae. The Lemurs, mostly of Madagascar, one genus of Africa and two or three from India and Malayan.

Nycticebus tardigradus, *Jerdon.*

Stenops javanicus, *Auctor.* | *N. bengalensis*, *Geoff. Horsf., Bly.*

Lajja banar, *BENG.* | *Slow-paced Lemur*, *ENG.*
Lajjawoti banar, *"* | *Sharnidah billi*, *HIND.*

Found in Bengal, Rungpore and Dacca.

Nycticebus javanicus, *Blyth*, of Java.

Loris gracilis, *Jerdon.*

Lemur ceylonicus, *Fischer, Blyth.*

The slender lemur, *ENG.* | *Tevangar*, *TAM.*
Sloth, of *Madras*. | *Dewantsi pilli*, *TEL.*

Found in Ceylon and Southern India.

Tarsium, a genus of Java.

Fam. Galeopithecidae, Flying Lemurs.

Gen. Galeopithecidae, natives of Malayan.

Jerdon.—See Mammalia, Monkeys, *Presbytis.*

PRIMULACEAE; Vent. The Primrose tribes of plants, of 5 gen., 7 sp., viz., 2 *Primula*; 1 *Cyclamen*; 1 *Androsace*; 1 *Centunculus*; 2 *Anagallis*. The Primrose family of plants, all form in Europe ornamental border flowers; but will not succeed in S. India. Wight gives *Primula denticulata* and *prolifera*.—*Riddell.*

PRIMULA SPECIOSA.

Bishkappa, *HIND.*

A narcotic. — *Powell's Hand-book*, Vol. i, p. 368.

PRIN, HIND. *Missiessya hypoleuca.*

PRINCE OF WALES' ISLAND, or Pulo Penang, the Arca Isle, as it is called by the natives, lies between 5° 14' and 5° 29' north latitude; N. E. point being in 100° 25' east longitude, off the west coast of the Peninsula, opposite to the principality of Quedah. It is upwards of fifteen miles long, and between eight and twelve broad, and contains an area of about 160 square miles, of which a little more than one-fifth is cultivated. The population in 1801, amounted to 10,310; in 1805, to 14,000; in 1822, including Province Wellesley, to 51,207; in 1826, to 55,116; in 1828, to 60,551; and in 1833, to 86,275. — *Newbold's British Settlements*, Vol. i, pp. 48, 54. See *Penang, Pulo Penang, Straits Settlements*

PRINCE'S FEATHER, *Celosia*. the Reverend Mr. Mason says this is the most elegant plant, when cultivated by the Karens, that he ever saw of the amaranth tribe. It is not the prince's feather of English writers *Amarantus hypochondriacus* but a species of *Celosia* which bears a long pendulous drooping panicle or plume like Roxburgh's *C. cernua*, but it is a different species. There are two varieties, one

with bright yellow flowers, the other red.—*Mason.*

PRINCE'S ISLAND, or 'Pulo Pontangh, an island on the south side of the Straits of Sunda.

PRINCIPALI, HIND. *Manisurus granularis*, *Linn.*

PRINCK, MALAY, a pot of earth or brass.

PRINIA (Horsfield), a genus of Birds. It has the following generic character:—Bill rather lengthened, much compressed, entire; riotus smooth, wings rounded, tail broad and cuneate; feet large, strong. *Prinia familiaris* is the *Prinya* of the Javanese, familiar creeper of Latham. It is abundant in many parts of Java, near villages and gardens, in the confines of which, among trees and shrubs, it builds its nest. It is a sprightly bird, sporting among the branches in short and rapid flights, and has received its name from its lively and pleasant notes.—*Horsfield; Swainson.*

PRINSEP. The name of a family; several of whom obtained employment or sought a career in India. The father, Mr. John Prinsep, having amassed a considerable fortune in India, in 1787, returned to England and soon after engaged in business as an East India Agent, and Italian Silk Merchant, became an Alderman of London, and Member of Parliament for the Borough of Queenborough. He was well known as a writer on Indian subjects. No fewer than seven of his sons came to India. James the seventh son greatly distinguished himself as an archaeologist. Henry Thoby Prinsep as a statesman. Mr. Henry Thoby Prinsep is described as a perfect encyclopædia of Indian information. He held a long series of high and responsible offices in almost every department, and was for five years a Member of Council under Lords Auckland, Hardinge and Ellenborough. He was also a good linguist, and more especially remarkable as one of the best Persian scholars of the present day. Mr. James Prinsep, for sometime Secretary to the Asiatic Society of Bengal, did more to extend the knowledge of Eastern Numismatics, than any other individual up to the present day (1873). The results of his researches have recently been given to the world in the shape of two handsome octavo volumes, entitled "Indian Antiquities." (Murray 1858), edited by Mr. Thomas. Mr. Charles R. Prinsep, a barrister in India, and formerly of the Middle Temple, is known to fame as the translator of "Say's Political Economy." Mr. H. T. Prinsep, again, is the author of several able pamphlets on Indian questions which have arisen from time to time, but also of various statistics of a most valuable kind, published in the Asiatic Society's Journal, and of two very interesting and

valuable works of a less ephemeral character. We allude to his "Origin of the Sikh Power in the Punjaub, and Political Life of the late Maharaja Runjeet Singh," and to his "Narrative of the Political and Military Transactions of British India under the administration of the Marquis of Hastings between the years 1813 and 1818." This work was published by Murray in 1820, in one volume, quarto; and a second edition, in two vols., octavo, appeared in 1825. For the compilation of this latter work (which is of high authority). Mr. H. T. Prinsep had great opportunities, as, on the first occasion of that Governor-General leaving the Presidency, he was selected as one of his suite, and was attached to his secretariat during the tour. He was re-appointed to the same office on Lord Cornwallis's second progress westward, when he took the field in person. Mr. Prinsep's design in this work (to borrow his own words) was "to trace out the political transactions of India, from the origin of the hostile spirit among the Mahratta powers down to the final crisis of the season 1817 and 1818; to relate the operations of that season, and to explain, as far as possible, the settlement resulting therefrom." Mr. H. T. Prinsep was born, we believe, in the year 1790, and received his early education at Haileybury College. His rank as a writer dates from May, 1808. Arriving in India in the following year, he was appointed assistant in the office of the Registrar of the Sudr Dewani and Nizamat Adawlut. In 1811 he became officiating assistant to the Magistrate of Moorshedabad, and officiating Registrar of the City Court, and subsequently assistant to the Collector of Burdwan.

A plant of Kaghan, a common north-west Himalayan plant, only found at 8,000 feet in Sikkim: it is employed in hedges. This is found in the Sutlej valley between Rampur and Sungnam at an elevation of 4,000 to 8,000 feet. Used for hedges, its seeds yield an oil.—*Hooker's Him. Jour., Vol. ii. p. 129; Cleghorn's Punjab Report, Vol. i, p. 67; Powell's Hand-book, Vol. i, p. 346.*

PRINTED CLOTHS. The art of calico-printing is one which was common to the Egyptians and Indians, and is still largely practised by the latter, and with a skill which in 1851, produced much to be admired, even in the midst of the productions of the world, and after so many attempts have been made to improve an art certainly imported from the east. Pliny was acquainted with the

wonderful art by which cloths, though immersed in a heated dyeing liquor of one uniform colour came out tinged with different colours, and afterwards could not be discharged by washing. The people of India were found practising the art when first visited by Europeans. The mordants they apply both by pencils and by engraved blocks, though it has been said that the former method was the only one employed. Blocks are, however, used throughout India, but silk handkerchiefs, had the parts, where the round spots were to be, tied up with thread so as not to be affected by the dye-liquors, and it was from this process of tying (bhandna) that they received the name of bandhana. The cloth-printers at Dacca stamp the figures on cloth which is to be embroidered. The stamps are formed of small blocks of kantul (*Artocarpus*) wood, with the figures carved in relief. The colouring matter is a red earth imported from Bombay, probably the so-called 'Indian earth,' from the Persian gulf. Though the art is now practised to much perfection in Britain, the Indian patterns still retain their own particular beauties and command a crowd of admirers. This is no doubt due in a great measure to the knowledge which they have of the effects of colours, and the proportion which they preserve between the ground and the pattern, by which a good effect is procured both at a distance and on a near inspection. Printed cloths are worn occasionally, as in Berar and Bundelkhand, for sarrees; and the ends and borders have peculiar local patterns. There is also a class of prints on coarse cloth, used for the skirts or petticoats of women of some of the lower classes in Upper India; but the greatest demand for printed cloths is for palempores, or single quilts. In the costlier garments woven in India, the borders and ends are entirely of goldthread and silk, the former predominating. Printing in gold and in silver is a branch of the art which has been carried to great perfection in India, as well upon thick calico as upon fine muslin. The size which is used is not mentioned, but in the Burmese territory the juice of a plant is used, which, no doubt, contains caoutchouc in a state of solution.—*Royle's Arts of India.*

PRINTING. Sir John Davis is of opinion that the art of printing, the composition of gunpowder, and the magnetic compass, which he says are justly considered in Europe as three of the most important inventions or discoveries of modern times, had their first origin in China. Their printing is by a system of stereotype, the types being made from the pear-tree wood, called by them ly-mo. In the beginning of the tenth century printing

was invented, and in A. D. 932 that mode of multiplying copies of books received the imperial sanction; a printed imperial edition of all the sacred works having been then published. The greatest of all the arts was not invented in Europe, till five hundred years after this. Marco Polo speaks much of the 'stamped' paper money of the Chinese; and he must have seen their printed books. Printing with moveable types (made of terracotta) was invented in China by a smith named Pishing before the middle of the eleventh century, but the invention does not seem to have been followed up. Wood-printing was known at least as early as A. D. 581; and about 904 engraving on stone for the press was introduced. Paper in China is made from bamboo from the bark of mulberry, of a hibiscus (*Rosa sinensis*), and of the tree called chu, (*Broussonetia papyrifera*). All bark-paper is strong and tough; it has rays crossing it, so that when torn you would think it was made of silk fibres. This is why it is called Mienchi or silk paper.

In the year 1870, there were six printing offices in Yedo alone (now called "Tokyo," i.e., Eastern Capital), and none but Japanese were employed in them. They turn out elementary school books to meet the large demand that now exists among this progressive people; to be used as the means for acquiring a knowledge of English and other European languages. None but their own people are employed. In European offices at Yokohama they are very useful as compositors, pressmen, &c., and they are well worth their wages of fifteen to thirty dollars a month, they even publish several newspapers. These, of course, are in their own characters, but the type is cast on a regular body, to English standard, and in a Japanese type-foundry at Nangasaki. The native characters consist of Chinese, and the Japanese "Hirakana" and "Katakana." The Chinese characters are arranged in cases with very narrow divisions the width of the body of the type; these were placed in the divisions on their feet, with the face upwards.

The first Tamil types seem to have been cut at Amsterdam in 1678, to express the names of some plants in the large work, 'Horti Indici Malabarici.' Ziegenbalg asserts, however, that they were so bad, that even the Tamils themselves could not make them out. It would appear that the next attempt was made at Halle, about 1710, to supply the Tranquebar Mission. Fenger says, The people there, though unacquainted with the Tamil language, succeeded in making some Tamil letters, which they hastily tried and sent to Tranquebar; where the

first part of the New Testament, as well as other things, was printed with them. This sample, the very first thing ever printed in Tamil characters, was the Apostles' Creed, and the friends at Halle when they despatched it with the printing-press, requested soon to be requited by a copy of the New Testament in Tamil." The printing of the New Testament was completed in Tranquebar in 1715. The type first cut at Halle is about equal to the size called English. Smaller founts were cut afterwards. A specimen is given of a part of Arndt's 'True Christianity,' printed at Halle in 1751. Founts of type were subsequently cut in India. Printing was carried on, both on the continent and in Ceylon. In 1761 the Madras government allowed the Vepery missionaries the use of a press taken at Pondicherry. The second specimen of printing shows the state of Tamil printing previous to recent improvements. Tamil typography owes its present excellence mainly to Mr. P. R. Hunt, of the American Mission Press. With much labour, he superintended the cutting of the punches of several founts; the smallest size (brevier) he had prepared in America. Mr. Hunt has produced the smallest vernacular edition of the scriptures ever yet issued in India. The American Press has also raised the standard of printing throughout the Tamil country. The Rev. W. Taylor states that up to 1835 the only Tamil works printed by natives were the Kural and some trifles by Auvaiyar. In that year Sir Charles Metcalfe removed the restrictions on printing, and soon afterwards native presses began to be established. In 1863 ten native presses in Madras, printing in Tamil, furnished returns of their publications. There are several more presses. Generally they are on a very small scale. According to hindoo custom, related families dwell together. A wooden printing press is owned in common; some members act as printers; others attend to sales. This, indeed, was the early practice in Europe. Hallam says, 'The first printers were always book-sellers, and sold their own impressions. These occupations were not divided till the early part of the sixteenth century.' In 1872, three or four native printers had iron presses, and even claim to hot-press their sheets. Some books printed by them are of very fair workmanship.—*Preface to Grammatica Damulica; History of the Tranquebar Mission*, p. 7; *Royle's Arts, &c., of India*, p. 483; *Pennant's Hindustan*, Vol. i, p. 132; *McCulloch's Commercial Dictionary*, p. 215; *Julien in Jour. Asiat.*, ser. iv, tom. ix, pp. 509, 513; *Chine Moderne*, pp. 626, seq.; *Yule Cathay*, Vol. i, pp. 219-221.

 This fish is one foot long. It inhabits the Isle of Tanna, Batavia, Coromandel and Mahe (fresh water). Its air-vessel is very thin, from which its isinglass is of little value.
PRISTIS ANTIQUORUM, the huge Saw fish, infests the eastern coast of the island of Ceylon. Two other species are found in the Ceylon waters, *P. cuspidatus* and *P. pectinatus*. *Squalus pristis*, is the Saw-snouted shark.—*Tennent's Sketches of the Natural Hist. of Ceylon*, p. 325.
PRISTONYCHIUS, a genus of the *Calathiidæ*, inhabits Nepal and Europe; while *Calathus* prefers a northern more than a southern climate.—*Hope's M. L. J.*, July 1840, p. 116.
PRISTOO SENA terminated the line of Anga; and as he survived the disasters of the great war, his race probably multiplied in those regions, where caste appears never to have been introduced.
PRITA, *HIND.* *Pinus gerardiana*.
PRITHI RAJ was conquered by Shahab-ud-din, at the close of the 12th century. The Chauhan, one of the principal Rajput races, are descended from Prithi Raj, the last hindoo ruler of Indra-prestha or Dehli, and they spread through Malwa and Rajasthan; their principal families are the Khichi, Hara, Bhadauria, Rajkumar, Rajor, Pratapnir, Chakarnagar and Mauchana.
PRITHU, the first king who taught cultiva-

tion and fabled to be married to Prithivi, a name for the earth.—*Wilson*.

PRITHIVI, SANS., from Prithu, a king who first formed towns, raised the arts, &c.

PRITHIVI, the goddess of the earth, is by some termed a form of Lakshmi, by others of Parvati. Her husband is Prithu, produced, in strict accordance with mythological extravagance, by churning the right arm of a deceased tyrant who had died without issue, that he might have a posthumous son, who is represented as a form of Vishnu. As a form of Lakshmi, Prithivi is the Indian Ceres. Daily sacrifices are offered to her. The hindoos divide the earth into ten parts, to each of which a deity is assigned. Prithivi is the goddess of the earth, Visvacarma, the artificer of the universe, that is, the Lord of creation, assuming that character, moulded the earth, and it became Prithivi-conspicuous; and therefore is that name, Parthivi, assigned to the earth. Prithu is her husband; he was an incarnation of Vishnu; as related in the following fable, from Wilford's chronology of the Hindoos. In the form of a cow, Prithivi was milked by Swayambhuva, or Adam, grand ancestor of Prithu, who so employed him; perhaps the old sire took delight in attending the dairies and fields of his beloved Prithu. Prithivi, as a personification of the earth, also represents patience; the hindoo, refer to the earth, or Prithivi, proverbially as an example of patience, or forbearance, permitting her bowels to be ripped open, her surface lacerated, and suffering every indignity without resentment or murmuring. She is quoted also as an example of correctness, as returning good for evil. Prithivi Pati, i. e., Lord of the Earth, is a title conferred on terrestrial, or real, as well as mythological sovereigns. He is deemed the architect of the universe, and chief engineer of the gods. He revealed the fourth Upaveda in various treatises on sixty-four mechanical arts, for the improvement of such as exercise them; and he is the inspector of all manual labours and mechanical arts. Prithivi, is also called Bhudevi, also Bhuma Devi, names of the earth. Bhudevi in hindoo mythology is the terrestrial name of Parvati, as goddess of the earth, as the names of Diana were varied to suit her various forms, she being Luna in heaven, Proserpine or Hecate in hell, so her archetype, the hindoo Parvati is the heavenly Bhavani, on earth Bhudevi, and Patala-Devi as consort of the regent of the infernal regions. Bhudeva, as spouse of the earthly goddess, is a name of Siva.—*Hindoo Infanticide*, p. 28; *Coleman*, p. 102; *Moor*, p. 113. See Hindu or Hindoo, Indra, Lakshmi, Narayana, Saraswati yavana yoni.

PRITHIVI SENA, see Inscriptions.

PRITHU, see Prithivi.

PRITHUDAKA, or Peloa, near Thanesar. Prithu Raja gave name to Prithu daka.

PRITYHARA, SANS., from prati, a preposition indicating that the action is returned or reflected, and ahara, to take.

PRİYADARSI, see Asoka or Pyndasi.

PRIVET, also Egyptian Privet, *Lawsonia alba*, Lam. See Henna.

PRIVET, INDIAN, *Vitex trifolia*, Linn.

PROBALONGGO, or Probbolinggo, is a district in East Java, the richest sugar producing district in the island, and its inhabitants are principally Madurese. The south-western side of the plain of Probbolinggo is bounded by the Tengger mountains where the people still cling to a religion supposed to have originated in hinduism. The people of the Tengger mountains, shortly described in Raffles' History, may be a relict of an aboriginal race. This race, like a few others in India, and the Archipelago, adopt the singular practice of building their villages in terraces. This practice seems to have once prevailed in the Philippines. The inhabitants of the Serwatti islands, select the summits of hills or the brows of cliffs which rise abruptly from the sea, as sites for their habitations. The crest or extreme summit of the hill is occupied by a large waving tree, the Ficus indica of Rumphius, beneath which the idols of the village are placed on square platforms of loose stones. Here the elders meet when any important matter is to be discussed. Below the tree the sides of the hills are scraped into a succession of platforms or terraces, on which are erected their oblong barn like houses with wooden walls and palm leaf thatch. At Letti, a neighbouring island, where the hills are far inland, the brows of the cliffs which overhang the sea are selected, and a similar mode of scarping into terraces is adopted when necessary. The same system also prevails at Baba and Timor laut. The Serwatti islanders have a more general resemblance to the inhabitants of the South Sea Islands, than to those of the Indian Archipelago. They are taller and fairer than the Malays or Bugis. They wear a waist cloth made of cotton or of the bark of the paper mulberry, and allow their long wavy hair to float over their shoulders or tie it at the back of the head. Their vessels, the coracora, are long and graceful with low sides and great breadth of beam, high stems and sterns which rise like horns at each extremity of the vessel, and are ornamented with festoons of large cowrie shells and bunches of feathers. They build their villages on the summits of cliffs or the brows of hills which rise abruptly from the sea or the banks of rivers. On

Major Hamilton, H. M. 21st M. N. I. who had travelled in Java, mentions that he found the same system of terracing amongst the Malle Arasar, or hill kings, of the Pulney hills in the extreme south of India.

PROCAPRA GUTTUROSA.

Antelope gutturosa, Pallas Whang yang.
Dzeren, Yellow goat of the Chinese.
Hoang yang,

Is nearly $4\frac{1}{2}$ feet in length, and 2 feet 6 inches high at the shoulder; the body also is large and corpulent, and the legs shorter than is common to the antelopes in general; the horns are black, lyrate, and marked to within a short distance of their points with prominent transverse rings, the suborbital sinuses are small; the larynx large and salient, forming, particularly in the old bucks, a prominent lump on the throat; upon the prepuce of the same sex there is likewise situated a bag about the size of a hen's egg, which contains a waxy substance similar to that produced in the analogous organ of the musk animal, but without any kind of odour; the tail is short, and the knees furnished with small bunches of hair, but scarcely sufficiently long and distinct to merit the name of brushes, the summer coat is of a grayish fawn-colour above, and white beneath; that of winter almost entirely white, being tinged but slightly with a grayish-yellow shade on the back and sides. The females resemble the males in colour, but are of rather smaller size, and without horns; they want the sac on the abdomen, and have two teats.—The Dzerens inhabit the dry arid deserts of Central Asia, Tibet, China and Southern Siberia, particularly the great desert of Gobi; and prefer the most sandy and stony plains, feeding upon such scanty herbage, as these localities supply, and avoiding water, to which they appear to entertain a marked aversion. They are remarkably swift, take prodigious leaps and when frightened, will occasionally pass over 20 or 25 feet at a single bound. In spring and summer they form small families which live apart from one another, but in the beginning of winter they unite in large flocks, always under the guidance of an experienced old buck. They never run, even when pursued, in a confused crowd but form single files, and follow closely in the foot steps of their leader. They rarely emit any voice. When taken they are easily tamed, and appear to have rather a predilection for the domestic state, often mixing with flocks of sheep, and approaching human habitations during the severity of the winter season. Their flesh is tender and well tasted, and they are a favourite object of chase with the Moghuls and Tartars.—*Eng. Cyc.*, p. 236; *Adams*.

PROCAPRA PICTICAUDA, the Goa or Ra-goa, the Tibet Ravine-deer of Europeans is met with on craggy mountain-sides, and, like the goral and chamois, delights to sport among cliffs and precipices. The Ragoa or Goa is described by Mr. Hodgson as an inhabitant of Tibet. It has brown hair with rufous tips; the inside of the ears and limbs white, and tail black. It is perhaps *P. gutturosa* in its summer coat.—*Adams*.

PROCELLARIDÆ, the petrel family of birds, of the order Natatores or swimmers, comprising 6 gen., 12 sp., viz., 4 *Diomedea*; 4 *Procellaria*; 1 *Prion*; 1 *Pelicanoides*; 1 *Puffinus*; 1 *Thalassidroma*.—*Cal. Mus. Cat.*; *Adams*.

PROCELLARIA HESITATA, 'Caped Petrel' of Indian and Southern oceans; a rare straggler in Britain, that has been obtained once only in Lower Bengal.

PROCELLARIA PELAGICA, Stormy Petrel, seems to belong to every sea.

PROCERIDÆ. Among the insects of this family, collected by Dr. Wallich, there were four or five species of true Carabus. Wherever the oak grows, there *Calosoma* will be found. *C. indicum* inhabits Nepal. If caterpillars are necessary to keep in check the luxuriance of tropical vegetation, the *Calosomata* are equally necessary to keep within bounds these insects, which sometimes destroy, in northern climes, nearly the foliage of the year.—*Hope's M. L. J.*, July 1840, p. 117.

PROCH, *Por.* Gunpowder.

PROCHILUS LABIATUS, a bear of Ceylon.

PRODDU TIRUGUDU, or Aditya bhakti chettu, *Tel.* Helianthus annuus, *L.*

PROGOSHKI, *Rus.* Mats.

PROME, a small town in British Burmah on the left bank of the Irawaddy river. It was taken by the British Indian army on the 1st October 1825, and again on the 9th September 1852. There is here a far-famed buddhist pagoda, commonly called 'Shoay San Dau,' or the royal golden-hair pagoda. The various kinds of trees associated with teak in the Promé forests are 22 in number, and are thus enumerated by Dr. McClelland, in the order of their numerical proportion:—

Acacia catechu,	Strychnos,
Odina wodier,	Conocarpus,
Pentaptera,	Hymenodictyon parviflora,
Spondias acuminata,	Bursera serrata,
Nauclea,	Kydia,
Inga,	Dipterocarpus alatus,
Tectona grandis,	Blackwellia,
Careya arborea,	Hopea odorata,
Terminalia,	Pterocarpus dalbergioides,
Shorea robusta,	Pterospermum? Heyniazum,
Walsura piscidium,	Meliococa trijuga.

Thus, teak holds the seventh place. In other words, there are six other kinds of trees more numerous within the limits of the

PROMOPSIS SPICIGERA.

Prome teak forests than teak itself. *Acacia catechu* probably forms 40 per cent. of the whole trees in the forests; *Odina wodier*, 10 per cent.; *Pentaptera* and *Spondias acuminata*, 5 per cent. each; *Nauclea* and *Inga* about 4 per cent. each; *Tectona*, *Careya arborea*, and *Terminalia*, 2 per cent. each; the remaining thirteen may be put down as bearing the proportion of 1 per cent. each, leaving 13 per cent. to be made up of other species, such as *Barringtonia acutangula*, *Acacia serissa*, *Galedupa arborea*, *Mimosa octandra*, *Erythrina*, *Dalbergia*, *Bombax* and *Xanthoxylon alatum*, which are found in low grounds only. The view from the top of the pagoda, across the river to the mountains in the west is grand.—*Dr. McClelland in Selec., Records of Govt. of India, Foreign Dept., No. ix, p. 103.*

PROMETHEUS, the cave to which the Macedonians attached, the story of Prometheus was somewhere in the Paropamisian mountains.

PROON-BA-JAIL, BURM. A tree of Akyab, and plentiful in Arrakan. Used for making wooden bells, &c.—*Cal. Cat. Ex. 1862.*

PROPHET, a term in use amongst the people of Europe to designate Mahomed whom his followers call the Rassool Oollah, or messenger of the Lord. Europeans sometimes call him the Arabian prophet, the false prophet.

PROPPEN, DUT. Vermicelli.

PRORA, HIND. *Machilus odoratissimus*.

PROSCIUTTI, IT. Hams,

PROSERPINACA, see *Haloragaceæ*.

PROSERPINE, Kali is the hindoo Proserpine, or Calligenia, the Grecian handmaid of Hecate. The latter name seems of hindoo origin, 'born of time' (Cali-jenema)? See Osiris.

PROSOBRANCHIATA, an order of Molluscs, of the class Gasteropoda. See Molluscs.

PROSOPIS, a genus of plants belonging to the order Fabaceæ.

PROSOPIS ALGARROBA, like *Ava* to produce chica, is chewed, and put in a bowl, mixed with water, allowed to ferment and drunk.

PROSOPIS DULCIS Kth.

Acacia levigata, Roxb. | *Mimosa levigata*, Roxb.
A tree of N. Spain introduced into India, from the Mauritius. The pulp of the pods is very sweet and is eaten.—*Voigt.*

PROSOPIS SPICIGERA, Linn, W. & A.

Fr. aculeata, As. Res. Adenanthera aculeata,

PROTEACEÆ.

Its pods.

HIND. | Shangar,

HIND.

This tree grows in the Salt Range, the Panjab, Hindustan, Bengal and all over the Peninsula of India. It is often stunted and gnarled, in the Panjab rakhs it is abundant and largely used for fuel in steam ships and railways. Yields the chief supply of fuel to the Panjab railway. Pod long, irregularly cylindrical, sweet to the taste, often esculent. It is a thorny tree in Coimbatore, in the black cotton soils of Mysore, common in the waste places and forests of Bombay, and common in Sind. It attains a considerable, even a large size, in Coimbatore and Mysore, and the timber is straight grained, strong and hard, easily worked and used for bandy wheels and other common purposes. It never reaches such a large size on the Bombay side, as would afford a square log of more than nine inches. In Sind, however, where it is common, it attains a large size, and its heart wood is strong, tough, dark coloured and is commonly used for weaver's shuttles. Dr. Wight found it sustain a weight of 592 lbs. Its pod is about an inch in circumference, and from 6 to 12 inches long, and when ripe it contains a quantity of a mealy substance which has a sweetish taste and is eaten by the natives. The tree is revered in the Dassera rites. One of the characteristic trees of the Panjab, yielding a larger amount of firewood at Lahore and Multan than any other. The heart wood is strong, tough and dark coloured; it is sometimes used for boat building and weaver's shuttles.—*Drs. Ainslie, p. 334; Wight, Gibson, and Stewart.*

PROST, HIND. *Populus nigra*.

PROSTITUTES The hindoo gods are worshipped in brothels, and fragments of the offerings are divided among the visitors. The great bulk of the prostitutes of India are of hindoo origin. In 1853, Calcutta had a population of 4,16,000, had 12,419 common women, of whom 10,000 were hindoos, several being daughters of Kulin brahmins. In Sep. 1867, there was reported to be upwards of 30,000 women in the town of Calcutta depending on prostitution, but this seems an unlikely number. The majority were said to be hindoos.—*Cal. Rev., Aug. 1868.* See Dancing girls, Deva dasi.

PROT of Kangra, *Marlea begonifolia*, Roxb.

PROTEACEÆ, Juss. An order of plants comprising 2 gen., 2 species, viz., 1 *Guevinia* 1 *Grevillea*. The genus *Protea* are natives of the Cape, are difficult to cultivate from their fleshy roots; the soil best suited for their growth is light loam mixed with sand, they

The apricot tree grows well on the first range of the Himalayas, bearing abundance of fruit in the months of May and June. Propagated in the same way as the peach. In India, where the tree has been naturalized. The apricot tree grows to a large size in gardens of the Daccan. It blossoms at the same season as the peach, from January to March; the fruit forms and attains the size of a common marble, after which it falls off, and this no care can prevent. Many efforts have been made to get buds to take both on the peach and almond stocks but without success, attempts to graft it by approach have hitherto been unsuccessful. It is the *Melea armeniaca* of Dioscoroides and the *Preecocia minor* and *Malus armeniaca* of Pliny. In China an oil is extracted from the stones. Moorcroft mentions that ten varieties are grown in Ladakh, all of them raised from seed, except one which is budded. Dr. Stewart has seen the apricot wild in many places from 4,000 to 6,000 feet, in the Panjab-Himalaya. It is commonly cultivated all over up to 10,000 or perhaps

PRUNUS DOMESTICA.

15,000 feet (and not 11,200 as stated by Hoffmeister) in some places in the dry climates of the Upper Sutlej and the Upper Chenab, and even to 11,500 or 12,000 feet in parts of Tibet. A great deal of the fruit, especially at the higher elevations, is very inferior, and in Tibet, particularly, Vigne mentions that it is generally small, which would seem to be corroborated by the fact that 200 maunds were imported into Le from Kashmir in 1867 (Cayley). Aitchison states that the dried apricots are imported into Lahoul from Tibet. Very fair fruit is grown in many parts, and in some of the Kanawar villages, especially, the trees constitute a chief form of the wealth of the inhabitants, and yellow heaps of it may be seen drying in thousands on the roof of almost every house. A considerable quantity (Davies' Trade Report puts it at 100 maunds) of dried apricots are annually imported via Peshawur into the Punjab from Afghanistan where the tree is largely grown. A gum, similar to gum arabic, exudes from wounds in the bark of the tree. The wood does not appear to be used for any special purpose, except occasionally for making the Tibetan drinking-cups, as stated by J. D. Cunningham.—Dr. Riddell; Dr. Royle; Birdwood, p. 551; Moorcroft; Charles Darwin, M. A., F. R. S.; *Variation of Animals and Plants under domestication*, Vol. ii, London, 1868; Dr. J. J. Stewart, M.D. See Acer.

PRUNUS BOKHARIENSIS, Royle.

Bokhara plum, ENG. | Kokamalis Græco, PER.
 Aloo bokhara, HIND., PER. | κοκκαμλεα, GR.

Cultivated at Ghuzni.

PRUNUS CERASUS.

Jerasaya, AR. | Padam, HIND.
 Common Cherry, ENG. | Aloo Baloo, PERS.

The Cherry tree is not found in any part of S. India; but abounds wild in the hills north of Deyrah Dhoon, producing a small common black fruit fit only for preserves, &c.—Riddell. See *Cerasus vulgaris*.

PRUNUS DOMESTICA, Linn.

Barkook, Bargoog,	AR.	Aroo; Aloo,	HIND.
var. Ejass,		Aloo chah, (small)	"
" Idrek,		Shah Aloo, (yellow)	"

Pacha; Paja,	HIND.	Jamoon,
Kalakot,		

A plant of Kaghan, also grows at Simla, at an elevation of from 7,000 to 10,000 feet, and *Dr. Stewart* has seen the people in the Murree hills eating the black berries of this tree. He describes it as a fine tree, with handsome bunches of white flowers in April, which grows in many parts of the Punjab Himalaya, from 4,000 to 10,500 feet, up to the Indus. The wood is not much valued, but is used for ploughs, railings, &c., and for spoons. The fruit is eaten by the natives, but has a mawkish astringent taste, not peculiarly attractive to Europeans. The kernel yields a poisonous volatile oil, similar to oil of almonds.—*Dr. J. L. Stewart* ; *Powell's Hand-book*, Vol. i, p. 346.

PRUNUS SEBESTANA, *POLUK.* Syn. of *Cordia myxa*, *Linn.*

PRUNUS TRIFOLIA, *Roxb.* Plum of Ladak.

Cyaneisen	GER.		
Berliner blau	"		

A pigment or dye, composed of cyanogen and iron, and procured by a chemical process from carbonate of potass, bullock's blood, green vitriol, and alum. It is prepared of different degrees of purity, and additions are made to it according to the purposes for which it is required. When pure, it is of a rich and intense blue, with a copper tint on the surface, inodorous, tasteless, insoluble in water, in alcohol and diluted acids; but is acted upon

and dissolved by strong acids. Prussian blue is now extensively made in China, the art of manufacturing it having been carried from the west to the east by a Chinese sailor.—*Waterston*, *Faulkner* ; *McCulloch's Com. Dic.*, p. 956.

PRUSSIC ACID, or **Hydrocyanic acid**, is obtained by the action of muriatic acid on bi-cyanuret of mercury. It is limpid, very volatile, and of a strong pungent odour, resembling that of bitter almonds. Its taste is acrid, and it is virulently poisonous. In medicine it is used as a sedative.—*Waterston* ; *Faulkner*.

The guava tree of the W. Indies, Mexico, and America, is cultivated throughout the E. Indies. It grows to the height of twenty or thirty feet, with leaves of pale green, and beautiful large white blossoms. The fruit is about the size of a pear, and a little yellowish when ripe, full of hard seeds, the size of buck-shot. The fruit is globose, yellow, and somewhat astringent, with an agreeable odour; the root and young shoots are astringent; and are esteemed strengthening to the stomach. The wood is but little used, though esteemed for engraving.—*Eng. Cyc.* ; *Malcolm's Travels in South Eastern Asia*, Vol. i p. 108.

Perakai,	MALEAL.	Goia pandu,	TEL.

The pear-shaped or white fruited guava tree grows all over British India, Burmah, and Tenasserim. In all southern Asia the guava is seen everywhere in gardens, and probably found its way to India from S. America through the Portuguese, its fruit is esteemed as a dessert fruit, but the scent when too ripe is unpleasantly powerful; it makes a most excellent jelly, and also is prepared in a similar manner to damson cheese at home. The fruit sometimes is as large as a common baking pear, and one weighed half a pound. They have been brought to great perfection in some gardens, and the fruit of a large size divested almost of seed: this sort generally has a very rough knotty coat, and is more spongy and less firm than the other varieties. A plant continually grown from layers in time ceases to produce seed, perhaps this variety has been so procured. It is easily increased by seed, and only requires a good soil to thrive in. The trees should be pruned once a year otherwise the branches become very straggling. Good gunstocks are made from the old wood. Wood small, but very hard and is used by Dr. Hunter for wood engraving, and commonly for pegs, mallets, handles of tools, &c.—*Mason; Rhode's MSS; Ainslie, p. 223; Dr. Riddell; M. E. J. R.; Dr. Cleghorn.*

PTEROCARPUS ERINACEUS.

esculenta, *Forst.*, Australia.
graminifolia, *Roxb.*, Paras, Sylhet.
vittata, *Lin.*, Sunderbuns.

The rhizome of *Pteris esculenta* is used as food in Australia, and that of *Marattia alata* in the Sandwich Islands.—*Simmonds* ; *Voigt*.

PTERIS AMPLEXICAULIS, Stipe-Clasping Brake, a large brake, common at Tavoy with pinnate fronds, whose leaflets have two lobes at the base which clasp their stipe.—*Mason*.

PTERIS GRAMINIFOLIA, Grass Fern. The trunks of forest trees in Tenasserim are often clothed with the green drapery of the grass fern, which grows upon them precisely like bunches of long grass.—*Mason*.

PTEROCARPUS, a genus of plants of the order Fabaceæ, generally tall trees furnishing useful timber and other products : the following species occur in the East and W. Indies :

dalbergioides, *Roxb.*, Andamans.
draco, *Lin.*, Guadalupe.
indicus, *Willd.*, Moluccas, China.
marsupium, *Roxb.*, Concan, Assam.
santalinus, *Lin.*, Coromandel.
wallichii, *W. and A.*

One species of *Pterocarpus* is known in the Tamil countries, as the Ausena maram : another, the Jumbagum maram, common about Nelambore and in Wynaad, is a large tree, wood used for building and fence gardens ; said to be durable, a third the Karoo vagoo, is a very common tree on the western ghats ; wood strong, durable, and much used for building, a fourth, the Wulla honnay, of the Canarese, grows in the Mysore forests, and is used for furniture and house-building. A Burmese species, Puddowk of Tavoy, is a large tree, used for furniture, &c., another called Beejah in Hindustani, is a tree of Jubulpore, grows to a large size, is found in all parts, but not very abundant, has an excellent wood, easily worked.—*McLvor* ; *Captain Puckle* ; *Gibson's Bombay Forest Report of 1857-60*, p. 12 ; *Dr. Wallich* ; *Cal. Cat. Ex.* 1862.

PTEROCARPUS ERINACEUS, is a tree which grows to 40 or 50 feet in height. When the branches are wounded, a clear bright gum exudes from them, which is one source of the gum kino of commerce, and is mentioned as such by Park. It is a very powerful remedy in obstinate chronic diarrhoeas and dysenteries, and in all diseases arising from laxity of tissue. Externally it is applied as a styptic to check hæmorrhages from wounds and ulcers, and to diminish discharges. The gums obtained from the *Pterocarpus erinaceus* of Gambia and Senegal, and from the *Pterocarpus marsupium* of India, are the true gum-kinos of commerce : the gum from the *Butea frondosa*, is the *Butea gum-kino* of commerce : Botany Bay kino is

PTEROCARPUS DALBERGIOIDES.

obtained from *Eucalyptus resinifera* : a kino-like gum is obtained from *Syzygium jambolanum*.—*Eng. Cyc.* ; *Royle*.

PTEROCARPUS ACERIFOLIUM.

Najee, BURM.

This grows along with teak in all the Pegu forests, its timber is extremely valuable and is as strong as either teak or oak. Its durability for purposes of ship-building has never been tested, because it has never been desicated or killed like the teak. It attains a girth of ten or twelve feet and rises to a lofty height. It has a dark-brown wood.—*McClelland*.

PTEROCARPUS BILOBUS, Banks.

Vayngi wood, ENG. | Vayngi marum, TAM.

This is reckoned by the natives a very useful wood. It is of a reddish colour, and is employed in making doors and windows, and for other common purposes.—*Ains. Mat. Med.*, p. 207.

PTEROCARPUS DALBERGIOIDES, Rb.

Padouk,	BURM.	Andaman red wood	
Hancee mara?	CAN.	tree,	ENG.
Red wood tree,	ENG.	Tenasserim mahogany,	MAHR.
		Beebla,	

This large and handsome tree is a native of the Andaman Islands, where it grows to 150 feet high with a girth of 15 feet. It is common in large jungles, above and below the ghats in Canara and Sunda. It is said to be found chiefly as a large tree about the neighbourhood of Promo and inhabited places to the north of that town, but rarely in the forests. Trees of the largest size abound in the forests of British Butmah, east of the Sitang river, also in the valley of the Salween river and its tributaries, the Thoungyeen, Yoonzaen, Illincbouy, Houndraw and Attaran : but they are much less frequent in Pegu and entirely wanting in some districts. It is abundant but scattered all over the provinces. The wood is prized beyond all others for cart wheels. The trees are felled green, and are split up into short planks 3 feet, 6 inches long, 2 feet wide and 9 inches thick. Three of these pieces make one wheel, and a pair is sold on the spot in the forests of the Prome district at from 12 to 25 Rupees. In the Tenasserim provinces, its maximum girth is 6 or perhaps 7 cubits, and maximum length 15 to 30 feet, that of great girth being always short. When seasoned, it sinks in water. It takes about two years to season ; when cut it has a peculiar and fragrant smell, another wood, called Paddowk, is procurable in abundance at Tavoy, which seems very strong but does not sink and is devoid of smell. The Padouk wood of the *Pterocarpus dalbergioides* of Roxburgh, is extensively used in the Gun Carriage Manufactories

PTEROCARPUS INDICUS.

of India: in that of Madras, for light field beams, cheeks, axle cases, perches, poles, timber framing, waggon perches and framing, heavy field cheeks, transoms, axle cases, hand spikes, poles, braces, framing, &c., all parts of garrison carriages, garrison traversing platforms, as well as gun and mortar platforms, transport carriages and limbers, cart work of all sorts, and heavy and light field wheels. In Burmah, a cubic foot weighs 60 lbs. In a full-grown tree on good soil the average length of the trunk to the first branch is 35 feet, and average girth measured at 6 feet from the ground is 9 feet. It sells there at 12 annas per cubic foot. The wood is not unlike mahogany, but is more heavy, red and coarse-grained, that of the root is beautifully variegated, closer grained and darker coloured. It is used for furniture, and, by the Burmese, to make their musical instruments.—*Drs. Voigt, Gibson and McClelland, Eng. Cyc., Mr. Robert Brown, Dr. Brandis, Cal. Cat. Ex. 1862, Mad. Cat. 1862, Royle Illust., p. 195.*

PTEROCARPUS DRACO, Linn.

Pt. officinalis, Jacq.	Pt. hemiptera, Gart.

Jyda-roomee, "	Khun sin washan,
Dragon's blood, ENG.	Hira da-khun,
Kandamoorgarittum, TAM.	Barg-i-bart.

This tree was introduced into India, from the West Indies, in 1812. It is native of the American Islands, and especially Guadeloupe. The bark, wood, and leaves are remarkably astringent. The dragon's blood in mass, of commerce, according to Jacquin, is the produce of this tree, but another sort, and most likely that sold in Indian bazars, is produced by the *Calamus draco* of the Straits, in the form of a red hard resin, in large somewhat cylindrical lumps; it contains benzoic acid and tannic.—*Voigt; O'Shaughnessy, p. 997; Powell's Hand-book, Vol. i, p. 342.*

PTEROCARPUS INDICUS, Willde.

Padouk, BURM.	Rosewood, ENG.
---------------	----------------

Grows in the Malay islands, in China and the Moluccas. It is a handsome tree with long waving branches and clusters of deep yellow flowers, which scent the air. It produces very fine timber, said to be white? and not equal to the red padouk of the *P. dalbergioides*. But, Dr. Wallich, noticing it as a Moulmein tree, says it is a very beautiful and hard compact timber, closely resembling the Andaman wood. Mr. Mason describes the *Pterocarpus indicus* of Tenasserim, as a majestic ever-green, whose yellow papilionaceous flowers clustering amid the bright drooping foliage, scent the air, like the large magnolias, for several hundred yards around. It is propagated by simply planting large branches in the ground at the commencement

PTEROCARPUS MARSUPIUM.

of the rains. There are, therefore, two trees called padouk, the red and the white, as distinguished by the Burmese—the red producing the finest timber, but the white padouk is by far the finest ornamental tree. It may be considered one of the most valuable forest trees of Burmah. This species also yields gum kino.—*Voigt; Hort. Garden 55, Firth, Dr. Cleghorn in M. E. J. R., Drs. Mason, Wallich.*

This is a large and a very beautiful tree, especially when in flower in the beginning of the rains: its seed ripens about the close of the year. It is widely diffused, and yields one of the most abundant and useful timbers of S. India, also the valuable gum kino of Malabar. It is one of the most lofty and striking trees in the Indian forests, with a very high trunk, which, however, is scarcely ever straight. It is met with from Cape Comorin to the Himalaya. It is common all round the foot of the Neilgherry ghauts and along the roads through the Wynaad. It is there notched in a V-shaped form, for the extraction of kino which meets with a ready market on the coast and is exported in wooden boxes to Bombay. It grows luxuriantly on the eastern ghauts, on the hills between Vellore and Salem, and on the Malabar and Canara ghauts, where large quantities are collected of the resinous 'kino'. The tree abounds near Tellicherry, and along the whole Malabar coast. It is not generally common in the Bombay forests, but is most so in the northern inland ones, and also in those of the extreme south, as in the Beedee talooka, and it everywhere reaches a great distance. Buchanan Hamilton mentions it under the name of Vijaya as occurring in Nepaul and also to the eastward of Bengal. It has been observed in the Concans, (Graham). Rajpeepla jungles, (Dr. Lush). Assam, (Voigt). It has a very close and frequently winding grain, but is subject to numerous faults of a coal black and charred appearance. Frequently a fault of 3 inches diameter and considerable length presents itself. On this account it might be a dangerous timber to use for joists. For all works, however, where such faults would not signify or would be

PTEROCARPUS MARSUPIUM.

exposed, as in rafters, bressumers, &c., &c., and, generally, pieces of small scantling, it would be found a most valuable timber. In strength it is much superior to teak, apparently always retains its essential oil, and, like it, door frames of 20 years' standing are the only instances of white ants having attacked the red wood. This tree is greatly prized at Dharwar, not for its exudation, but for its timber. On the Godavery, the native dhol is often made of it. The timber was tried as sleepers on the Madras railway, but iron sleepers now take the place of all other kinds. It makes handsome furniture, and resembles fine mahogany, but must be well seasoned, to avoid its yellow stains. The tree being thus widely diffused, and the exudation procurable in large quantity, it may possibly come into extensive use in dyeing and calico-printing. The timber is of a dark-brown colour, it dyes yellow and for building purposes it is almost as good as teak, but cannot be used for lintels of doors, windows, &c., as it discolours the whitewash. It yields from incisions a large quantity of blood-red juice, which on being simply exposed to the sun, hardens and then quickly cracks into little angular masses and crumbling fragments which constitute, without further preparation, the kino of the shops. Dr. Wight sent specimens of kino from Coimbatore. Specimens of the exudation sent by Dr. Cleg-horn to Professor Christison in 1846 from Mysore, were considered by him 'quite identical with the kino of commerce.' The tree being thus widely diffused, and the exudation procurable in large quantity, it may possibly come into extensive use in dyeing and calico-printing. The product can be obtained with facility by simply incising the bark and requires no outlay save that of collecting. The timber is very little inferior to teak, it seems less liable to split after long exposure and is equally strong, but the wood is heavier. Vessels built in the Ganjam districts are planked with it; and the door pannels and venetians of the neglected houses at Ganjam are formed of this wood and have stood better than teak similarly situated. Very great caution is requisite in using this wood to obtain it sound. It is more expensive than teak to work, and when sawn green the outer planks bend considerably, its price on the Godavery is about 3 annas a foot. This is one among the unlucky woods of the natives though the prejudices against it have in part given way to profit. For general utility, it is superior to any other mahajante wood, a commercial term among the people of the Northern Circars including all wood used for building except teak.—*Dr. Roxburgh's Flor*

This large lofty tree grows throughout British India and in the Archipelago. It is abundant on the Nagery Hills, Ceylon, Timor. Its timber is chiefly used by dyers and colour manufacturers, also to colour several official preparations, such as compound tincture of lavender. Its colouring matter called 'santal-in,' forms a beautiful colour, precipitates with many metallic solutions. The wood is exported from Madras in billets, it is very heavy, sinking in water, extremely hard, of a fine grain and bright garnet red colour which brightens on exposure to the air, it is employed to dye lasting reddish brown colours on wool, it yields its colouring matter to ether and alcohol, but not to water, its price in bond in England was in 1852, 13£ to 14£ a ton:

But, as brought into Madras since 1848, its timber is in short billets, generally hollow, or in twisted or knarled masses, the billets 2 to 3 feet long and rarely 3 feet in girth, indicating that the forests are being exhausted. It is not, seemingly, used in Madras city, but is very largely exported to Calcutta. The billets are of a deep red colour, the concentric circles being divided by dark lines. With different mordants, it yields various shades of red, but these are said not to be permanent. The Madras exports for 1853-1854 amounted to 47,431 cwts., value 59,570 rupees. In the 4 years 1852-53 to 1855-56, there was exported from Madras cwts. 179,815, value rupees 2,20,983; the destination chiefly being the United Kingdom, Indian French ports, Pegu, Bengal. Red sanders wood is principally shipped to England from Calcutta in logs from 2 to 10 inches diameter, generally without sap, and sometimes in roots and split pieces. This will explain much of the shipments from Madras to Calcutta, in which

latter district the tree is not known to grow. The logs are often notched at both ends, or cut with a hole as for a rope, and are much worn externally from being dragged along the ground; other woods, as also indeed ivory tusks, are sometimes perforated for the like purpose. It is heavy, extremely hard, with a fine grain, and is very much used as a dye wood, and by colour manufacturers: also, often in turnery. It is largely used in Bengal for hindoo images, and in Ajmere for the suffumigations of hindoo idols. It yields its colouring matter to alcohol and ether, but not to water. It is employed to dye a lasting reddish brown on wool. Dr. Wight says this wood is brought to Coimbatore in small quantities from Mysore, and sold by weight at an extravagant price. Seen under the microscope, the texture is the same, as that of *P. marsupium* the colour only differs. It grows abundantly in the Naggery Hills. It is sold by weight as a dyewood, and forms a regular article of export. It takes a beautiful polish, but the high price of the wood for dyeing purposes, precludes its use as a timber. The imports of redsaunders wood from Calcutta and Bombay chiefly into London are to the extent of 700 or 800 tons a year, worth £6 to £9 per ton. It is brought to Ajmere from Delhi, costs ten rupees per maund. Indian practitioners, sometimes recommend it in powder in conjunction with certain herbs, and mixed with gingilie oil, as an external application, and purifier of the skin, after bathing. Its red colouring matter, called Santalin, also acts as a diaphoretic, like gentian. It is applied to the forehead in headache; and also as a cosmetic.—*Ains. Mat. Med.*, p. 210; *Eng. Cyc.*; *Rohde's, MSS.*; *Tredgold, Mr. Rohde's MSS.*, *Captain Beddome, Dr. Wight, Dr. Cleghorn in M.E.J.R. of 1855, Dr. Cleghorn in Conservator's Report*, pp. 37-38, *Mr. Faulkner, Mr. Simmonds, M. E. J. R., Balfour's, Commercial Products of Madras Presidency, Drury's Useful Plants, Voigt*; *Gen. Med. Top.*, p. 131; *Ains. Mat. Med.*, p. 42; *Powell's Hand-book*, Vol. i, p. 342.

PTEROCARPUS SISSOO, *Roxb.* Syn. of *Dalbergia sissoo*, *Roxb.*

PTEROCARPUS WALLICHII, produces a timber which, in its finest specimens, bears so strong a resemblance to mahogany, that a visitor mistook it for mahogany, and recorded it as such in the book of his travels. At Maulmain, it is called red-wood, and one of the trees, for there are two species, *Pt. dalbergioides* and *Pt. wallichii*, differs very slightly from the tree which yields the Audaman red-wood, of which Roxburgh wrote: "wood not unlike mahogany, but more heavy, red, and coarse in the grain. That of the root

beautifully variegated, closer grained, and darker coloured."—*Mason*.

PTEROCAULON ALOPECUROIDE-UM. Syn. of *Conyza alopecuroides*.

PTEROCERA, a genus of the mollusca.

PTEROCYCLOS, a genus of the mollusca.

PTEROCLES, a genus of birds, of the family Pteroclidæ, the sand grouse or rock grouse of Europeans in India.

arenarius, *Pallas*, large sand grouse, Panjab, N. W. Provinces and Sind.

fasciatus, *Scopoli*, painted sand grouse, over most of India except Bengal and Malabar.

alchata, *Linn.*, large pin-tailed sand grouse, S. Europe, N. Africa, Central Asia, Panjab, Sind.

exustus, *Temm.*, common sand grouse, Central and S. India.

senegallus, *Linn.*, S. Africa, Arabia, Sind.

coronatus, Africa, W. Asia.

The large "black breast" (*Pterocles arenarius*) is at once distinguished by its size and even tail from (*P. exustus*) the "pin-tailed grouse," which is by far the most common; both are met with in flocks in fields and waste places. Their flight is strong; and although their flesh is tough and unsavoury, they are much sought after by European sportsmen. Adams has been informed that another species is sometimes seen on the north-west frontier of the Punjab, possibly the large pin-tail (*P. alchata*), which is said to be plentiful in Affghauistan and westward.—*Adams*; *Serdon*. See Birds.

PTEROMYS, *Cuv.* A genus of the family Sciuridæ, and commonly known as the Flying squirrels because of the skin of their flanks being extended between the fore and hind feet, forming, when expanded, a wide parachute. The species occur in the South-East of Asia and in the islands of the Archipelago.

Pteromys cineraceus, *Blyth*, Burmah.

Pteromys elegans, *S. Muller*, Java.

Pteromys inornatus, *Is. Geoffroy*.

Pt. albiventer, *Gray*.

White-bellied flying squirrel, Eng. | Rusi-gugar, KASHMIR.

Above grizzled reddish brown, length of head and body 14 inches; found throughout the N. W. Himalaya from Kashmir to Kumaon, Simla, Landour from 6,000 to 10,000 feet.

Pteromys leachii, *Gray*. Syn. of *Sciuropterus fimbriatus*, *Gr.*, *Bly*.

Pteromys magnificus, *Hodgson*.

P. chrysathyryx, *Hodg.* | *Sciuropterus nobilis*, *Gray*.

Red-bellied flying squirrel, Eng. | Biyom, LAPON.

Above dark chesnut or ochreous chesnut mixed with black, with lower part of a lighter hue, and the tail tipped with black. Its fur is very soft; a female, measured 16½ inches from head to insertion of tail; the latter was 20 inches in length. This flying squirrel is

nocturnal in habits, secreting itself in hollows of decayed trees, and feeds on the tender shoots of the pine.

Pteromys nitidus, *Geoffry*, Pen. Malacca.

Pteromys oral, *Tick.* Syn. of *Pteromys pataurista*, *Pallas*.

Pteromys pataurista, *Pallas*, *Blyth*.

<i>P. philippensis</i> , <i>Elliot</i> .	<i>P. oral</i> , <i>Tickell</i> .	
Brown flying squirrel, <i>ENG</i>	<i>Pakya</i> ,	MAHR.
<i>Oral</i> ,	<i>Para-chalen</i> ,	MALEAL.

Upper parts dusky maroon, black-grizzled with white, head, body, 20 inches long, inhabits Ceylon, North to Central India. It lives on roots.

Pteromys philippensis, *Gray*, Philippines.

Pteromys senex, *Hodg.* Syn. of *Sciuropterus caniceps*, *F. Cuvier*, *Gray*.—*Tennent's Sketches of the Natural History of Ceylon*, p. 42; *Adams*; *Jerdon's Mammals of India*.

PTEROPODA, a class of the Mollusca, as under :

CLASS III. Pteropoda.

SECTION A. Thecosomata.

FAMILY I. Hyaleidæ.

GENERA. *Hyalea*, *syn. Cavolina*, *rec. 19 sp.*, *fossil 5 sp.*
Cleodora, *syn. Clio*, *rec. 12 sp.* also *fossil*.

Sub-genus. *Creseis*, *rec. 5 sp.*

Large Fox bat,	ENG.	Kalong,	MALAY.
Flying fox,	"	"	TAM.
Rousette,	"	Sikat yelli,	TEL.
Gadal,	HIND.	Siku rayi,	"

Found in Ceylon, India and Burmah. It is eaten in Ceylon.

Pteropus leschenaultii, *Jerdon*.

Pt. seminudus, *Kelaart*. | Fulvous Fox-bat, *ENG.*

Madras, Carnatic and Trichinopoly.

Pteropus edulis, Java and Malacca.

Pteropus dussumierii, *Is. Geof.* Continent of India ?

Cynopterus marginatus, *Jerdon*.

<i>Pteropus pyrivorus</i> ,	<i>P. tittæcheilus</i> , <i>Temm.</i>
<i>Hodgson.</i>	<i>Ell.</i> , <i>Bly.</i> <i>Horsf.</i>
Cham gadili,	BENG. Small Fox bat,
	ENG.

Throughout all India and Ceylon.

Cynopterus affinis, *Gray*, Himalaya, a synonyme of *C. marginatus*.

Macroglossus minimus, *Jerdon*.

Pteropus minimus.

Tenasserim and Malayana.

Many of the *Pteropus* bats inhabit Malayana, Ceylon, India, Burmah, Malacca, Java. To drink, which it does by lapping, the *Pteropus* suspends itself, head downwards from a branch above the water. Insects, caterpillars, birds' eggs, and young birds are devoured by them; and the Singhalese say that the flying-fox will even attack a tree-snake. It is killed by the natives for the sake of its flesh, which Sir J. E. Tennent was told resembles that of the hare. It is strongly attracted to the cocoanut trees during the period when toddy is drawn for distillation, and exhibits, it is said, at such times, symptoms resembling intoxication. Neither the flying-fox, nor any other bat in Ceylon, is ever known to hibernate. In Western India the Portuguese eat the flying-fox, and pronounce it delicate and far from disagreeable in flavour. *Pteropus edwardsii* take up their abode on a banyan or other tree. Each bat is suspended by the hind-feet. The Mahrattas call this bat the 'wurbagool.' The species is very plentiful, and numbers are usually to be seen in the still evening at high elevations, flying with an easy floating motion, now and then varied by the regular flap of their large wings as they steer their course towards the fruit-groves. The half-caste Portuguese eat them, and look upon their flesh as delicious. Individuals of this species appear to differ considerably in size, which may, however, be owing to age. One killed by Dr. Adams measured from tip to tip about five feet. Figs, mangoes, &c., constitute their favourite food. *Pteropus edwardsii* and *P. conspicillatus* are found in Australia and Tasmania.—*Tennent's Sketches of Nat. History*, p. 18.; *Adams' Naturalist in India*; *Jerdon's Mammals of India*.

PTEROSPERMUM, a small genus of plants of the order Sterculiaceæ, (from the Greek word πτερόν signifying a wing, and σπέρμα a seed), found in the Indian Isles and the southern parts of India. All the species form

PTEROSPERMUM SUBERIFOLIUM.

handsome trees, and abound in mucilage. The following are East Indian species :

- acerifolium, *Willde*, Peninsula of India, Assam.
- aceroides, *Wall.*, Martaban.
- heyneianum, *Wall.*, Gingi, Courtallum.
- lanceifolium, *Buch.*, Assam.
- obtusifolium, *Wight*, Courtallum.
- rubiginosum, *Heyne*, Courtallum.
- reticulatum, *W. and A.*, Peninsula of India.
- suberifolium, *Law*, Peninsula of India, Ceylon.

PTEROSPERMUM ACERIFOLIUM,

Willde.

Kanuk champs, BENG. | Toung-phet won, BURM.
Nagee, BURM.

A useful timber tree and affording good shade. According to Voigt, this is a large tree, of the peninsula of India and Assam, and it grows along with teak in the Pegu forests, though scarce. The timber is extremely valuable and is as strong as teak or oak, but its durability has never been fairly tested, as it has never been desiccated like teak. It attains a girth of 10 or 12 feet and rises to a lofty height. It has a dark brown wood.—*Dr. McClelland, Eng. Cyc., Voigt.*

PTEROSPERMUM ACEROIDES, *Wall.*

Tha-ma-jam-wai-zoke, BURM.

A timber tree of Martaban, and growing in the Pegu forests similarly to *P. acerifolium*, but plentifully ; timber of the same qualities as *P. acerifolium*.—*Voigt ; Wallich ; McClelland.*

PTEROSPERMUM HEYNEANUM, *Wall.*

Pterospermum suberifolium, Willde.

Velago xylocarpa, *Gartn.*

Welang-gas, SINGH. | Lolugu chettu, TEL.
Taddee maram, TAM. | Loluga kurra, TEL.
Nolika chettu, TEL.

A native of all the mountainous tracts of India. Flowering time the beginning of the hot season. Trunk erect, growing to be a timber tree of middling size. The wood is white and too soft to be of much use.—*Rohde's MSS.*

PTEROSPERMUM SUBERIFOLIUM

Welang tree, ANGLO-SINGH. | Taddi maram. TAM
Velenge. SINGH.

This is a native of the mountainous tracts all over India. A tree of Courtallum, of the Godavery forests, and the Ginji hills. Wood pinkish and hard, but is generally hollow in the centre. In Ceylon, it is common up to an elevation of 2,000 feet, especially in the drier parts of the island. The wood is useful for many purposes where toughness is required, such as poles of bullock carts, betel trays, and gun stocks. A cubic foot weighs 36 lbs., but it is said to last only from 5 ? to 7 ? years. Flowering time the beginning of the hot season, March, April and May. Trunk erect, growing to be a timber tree of middling size.—*Thw. Mr. Rohdes MSS, Mr. Mendis ; Tennant ; Voigt ; Capt. Beddome.*

PTEROSPERMUM INDICUM.

PTEROSPERMUM INDICUM—?

Kyaboka wood tree, ENG. | Lingoa wood tree, ENG.
Kaiaboka wood tree, " | Seriouhout, MALAY
Amboyna wood tree, "

According to Holtzapfel, the botanical name of the Kyaboka wood tree has not yet been determined with certainty. But, it has been said to be called *Pterospermum indicum*. The Kyaboka is said by Prof. Reinwardt, of Leyden, to be the burr of the *Pterospermum indicum* ; but, by others that of *Pterocarpus draco*, and to be brought from the Moluccas, the islands of Borneo, Amboyna, &c. The native name appears, from the specimen of Mr. Witson Saunders, to be " Seriouhout," the wood itself is of the same colour as the burr, or rather lighter, and in grain resembles plain mahogany. Col. Lloyd is quoted as saying that the root of the cocoanut tree is so similar, when dry and seasoned, to the bird's-eye part of the wood, termed kyaboka, that he could perceive no difference, the cocoa has a tortuous and silky fracture, almost like indurated asbestos. But, it is said, the comparison of the palm wood with the kyaboka, renders the question uncertain, as amongst the multitudes of ordinary curly woody fibres that one cannot account for in a palm, there are a few places with a soft friable matter much resembling it. The general belief is that *P. Indicum* throws out burrs or excrescences, and that which receives the name of Amboyna wood or Lingoa wood seems to be the timber of the bole of the tree, sometimes along with that of the burr. The Lingoa wood, or Amboyna wood of commerce is abundant at Ceram, New Guinea, and throughout the Molucca seas, and can be obtained in any quantity, if the precaution be taken of ordering it during the previous trading season. It is very durable and takes a high polish. At the exhibition of 1851, there was seen a circular slab of this wood, from Ceram, 6 feet, 7 inches in diameter. But, such large circular slabs are only obtained by taking advantage of the spurs which project from the base of the trunk, as the tree itself has not sufficient diameter to furnish slabs of such widths. They are occasionally met with so large as 9 feet, but the usual size is from 4 to 6 feet. Amboyna or Lingoa wood was imported in considerable quantities into Great Britain during the period in which the Moluccas were British possessions ; but Poole in his Statistics of commerce says it is now seen in Britain.

The Kyaboka wood of commerce, on the other hand, is supposed to be from the knotty burrs or gnarled excrescences. It is brought from Ceram, New Guinea, the Arru and other islands of the Moluccas, to Singapore ; and

PTILONOPUS CINCTUS.

is much esteemed as a fancy or ornamental wood for cabinet-work ; of late years, its estimation seems to have decreased in Europe, but it is still much valued by the Chinese, and is sold by weight. It is sawn off in slabs from 2 to 4 feet long and 2 to 8 inches thick. It resembles the burr of the yew, is very hard and full of curls—the colour being reddish brown, varying to orange. It is used for making small boxes, writing desks and other fancy ornamental work. It is tolerably hard, and full of small curls and knots, the colour is from orange to chestnut brown, and sometimes red brown. At the Madras exhibition of 1855, a slab of Kyaboka wood, imported from Singapore, was exhibited by Dr. Sanderson. A small portion was polished, and in its marking showed well the highly ornamental appearance of the wood. The specimen exhibited the very knotty character and curly fibres of the wood, from which pieces of even a foot square, free from flaws, can rarely be obtained.—*Holtzapfel, J. R. M. E. of 1855; Cat. Ex. 1851; Sing. Cat. Ex. 1861; Poole's Statistics of Commerce.*

PTEROSPERMUM LANCEFOLIA, *Roxb.* A tree of Assam, with a dense strong wood.

PTEROSPERMUM SEMI-SAGITTATUM, *Buch.* A tree of Assam, which flowers in March, April and May, with large white fragrant flowers.—*Voigt.*

PTEROSPERMUM SUBACERIFOLIUM.

Na-gee, Burm.

Dr. McClelland, at p. 133 of No. ix of the Records of the Government of India, thus remarks : *Pterospermum accroides*, *Thama-jam-wai-zoke* : also *P. subacerifolium* and *P. acerifolium*, *Najee, Burm.*, three species of large timber, found growing along with teak in all the forests of Pegu. The two first are plentiful but the third kind is scarce. This timber is extremely valuable and is as strong as either teak or oak. Its durability for purposes of ship-building has never been tested because it has never been desiccated or killed like the teak. It attains a girth of ten or twelve feet and rises to a lofty height. Wood dark-brown.—*Dr. McClelland.*

PTERYGOTA ROXBURGHII, *Schott and Endl.*

Sterculia alata, Roxb.

A tree of Sylhet and Chittagong, with large, iron-coloured flowers, streaked with crimson and yellow. At Silhet, its seeds are eaten by the natives as a cheap substitute for opium.—*Roxb., Vol. iii, p. 182; Voigt, p. 103.*

PTILONOPUS CINCTUS, a white headed pigeon of Timor.

PTOLEMY PHILADELPHUS.

PTILONOPUS SUPERBUS, and *P. iogaster*, green and purple-doves.

PTOLEMAIS of the Greeks, the modern Akha or Acre.

PTOLEMAIS THERON, was built by Eumedes, and was in lat 16° 24'.

PTOLEMY LAGUS, or Soter, was the son of Philip of Macedon, by his concubine Arsenee. He was a favourite of Alexander the Great, on whose death he obtained Egypt, Lybia, and part of Arabia, to which, on the death of Perdiccas, he added Coelo-Syria, Phoenicia, Judaea and the isle of Cyprus. He made Alexandria his capital and built there a lighthouse, called the Pharos, as a guide to pilots for that harbour. Alexandria was now made the port on the Mediterranean side, and merchandise from Europe was carried thence up the Nile to the city of Coptus (probably near Kench) and conveyed across the desert from thence to the sea-port of Myos-Hormos (probably near Cosseir) on the Red Sea. He dug a canal from a branch of the Nile to Damietta, a port on the Mediterranean. The canal was 100 feet broad, 30 feet deep, and ten or twelve leagues in length, extending in fact to the 'bitter wells.' He meant to have continued it to the Red Sea, but desisted from fear that the Red Sea was three cubits higher than the land of Egypt ! That this canal, though deeper than that of M. de Lesseps, did not succeed is evident from the fact that in 277 B. C. Ptolemy Philadelphus again changed the direction of Indian traffic. Ptolemy Lagus died B. C. 285.

PTOLEMY PHILADELPHUS, son and successor of Ptolemy Lagus, was so named ironically because he killed his two brothers. He was a great encourager of commerce. He is said to have caused the Hebrew Scriptures to be rendered into Greek, in that version called the Septuagint. He was a liberal patron of learned men. He constructed considerable fleets both on the Red Sea and the Mediterranean sea. On account of the dangers attending the port of Myos Hormos, Ptolemy Philadelphus sent an army to construct the haven of Berenice, in which the ships engaged in Indian commerce took shelter in great security. Trade increased enormously by the new route, and Alexandria became rich and famous. Ptolemy Philadelphus (287-246 B. C.), on the recommendation of his chief librarian (Demetrius Philaretos), is said to have sent a Jew of the name of Aristas, to Jerusalem, to ask the high priest for a MS. of the Bible, and for 70 interpreters. Others maintain that the Hellenistic Jews who lived at Alexandria, and who had almost forgotten their native language, had this translation made for their own benefit.

Certain it is, that about the beginning of the third century, B. C. (285), we find the Hebrew Bible translated into Greek.

Ptolemy Philadelphus constructed a canal from Arsinoë (near the present Suez) to the Pelusiac branch of the Nile: and afterwards, possibly because of the tedious and dangerous navigation of the upper part of the Red Sea, founded the city of Berenice on the western side of that sea, and nearly under the tropic (that is, 450 miles below Suez), from whence the merchandize was transported across the desert of Thebais to Coptus on the Nile. Ptolemy Philadelphus died B. C. 246, aged 64. —*Muller's Lectures, p. 86.*

PTOLEMY EUERGETES, son and successor of Ptolemy Philadelphus, declared war against Antiochus Theus, to avenge the death of his sister Berenice, the wife of Antiochus. Ptolemy made himself master of Syria and Celicia, and was extending his conquests when the news of a revolt re-called him to Egypt. He soon quelled the insurgents, and by the prudence of his reign acquired the title of Euergetes or benefactor. He died B. C. 221, and was succeeded by

PTOLEMY PHILOPATERS, ironically so-called because he had poisoned his father, his mother and several of his relatives. He favoured the Jewish nation. He died B. C. 204.

PTOLEMY, (CLAUDIUS,) or Claudius Ptolemæus, generally known as Ptolemy the Geographer, lived about A. D. 138. He was a mathematician of Pelusium and is celebrated for his system of the world, in which he placed the earth as the centre. His geography is a valuable work, and was printed at Amsterdam in 1618, folio; his treatise on Astrology in 1535, and his Harmonica at Oxford in 1683. Although this geographer's Map of India is exceedingly faulty, a work which has travelled down to us from the second century of our era, must have possessed something worthy to recommend it, and to keep it alive. Taxila, almost due north of Barygaza, is placed by Ptolemy 11° to the east of it; and the mouth of the Ganges, which was fixed by land-measurement from Taxila and Palibothra, is placed 38° to the east of the mouth of the Indus, the true difference being only 20°. As a general rule, the Greeks would seem to have designated the various peoples whom they encountered by the names of their principal towns. Thus we have Kabura and the Kabolitæ, Drepsa and the Drepsiani, Taxila and the Taxili, Kaspeira and the Kaspeiræi, from which General Cunningham infers that there was most probably also a town named Cadrusia, whose inhabitants were called Cadrusi. The names of other peoples and towns are recorded by Ptolemy;

but few of them can now be identified, as we have nothing to guide us but the bare names. The Parsii, with their towns Parsia and Parsiana, General Cunningham takes to be the Pashai, or people of the Panjhir or Panshir valley. The true name is probably Panchir, as the Arabs always write *j* for the Indian *ch*. According to Ptolemy, the three great passes, in the western chain of mountains, the Pyle Sarmatæ, the Pyle Albanie, and the Via Caspia, were each closed by large beams of wood, pointed with iron. In the

st of the narrow valley flowed a river. The southern extremity was protected by a castle built on a high rock. This defence was to prevent incursions from the people of the north. It is likely that the first, the Pyle Sarmatæ, is the same with the Porta Ibericæ, or Porta Caucasica, mentioned by Strabo, and the present pass, or valley of the Terek. The two latter, the Pyle Albanie and the Via Caspia, merely bestow two names on one place, which is the pass now called Derbent. But there was another, the Porta Cumana, that lay farther westward. Pliny notices it particularly, describing its fortress by the name of Cumania. These defiles, as keys of the East, have always been vigilantly guarded by the possessors, who knew their value. But Leon the First, rather chose to incur an inroad from the barbarians, than be at the smaller expense of keeping the gate that fixed their boundary. Justinian knew better; and concluded a treaty with Kobad, king of Persia, (A. D. 532,) agreeing that this pass should be protected by both sovereigns in common; or, if totally confined to Kobad's troops, the Roman should pay the Persian monarch one million and a hundred thousand pounds weight of gold, in reward of the double service. Ptolemy, makes mention of the "Arcati soren." In the last map of his volume, that which contains the "Aurea Chersonesus" and the "Iabudes Insulæ," (supposed to have meant respectively the Malayan Peninsula or Sumatra and the Java Islands) he places a country far to the eastward of the Aurea Chersonesia, under the equinoctial line, which he states to be occupied by "Æthiopes Ichthyophagi," or "Negro fish-eaters;" the first term being that employed by the Romans to distinguish the black and woolly haired Africans from the Mauritan and other brown races of the east; and the second, that usually applied to all nations who derived a portion of their subsistence from the sea. The system of naming nations from the food which formed their chief means of support, seems to have been very prevalent among the ancients; witness "Hippophagi" the horse eating Tartars, "Lotophagi," lotus eaters, &c. This

system, although not to be recommended at the present day, has proved highly useful, for these names are sometimes found to contain the only existing description of the habits of the people on whom they were conferred, as in the present instance. Dr. Leichhardt in his late overland journey from Sydney to port Essington, found some tribes of genuine Loto-phagi on the lagoons of the table-land, as will come to be noticed below. The position of this country with regard to the Aurea Chersonesus agrees well with that of New Guinea, the great seat of the Papuan race. The existence of a negro people, at so remote a spot, which he must have learned from the information of Indian navigators, seems, indeed, to have led Ptolemy into the great error of his system, for believing that the country of the "Æthiopes Ichthyophagi" formed part of the continent of Asia, he has made that continent, in his general map of the world, come round by the south and join the African continent about Point Prassum, in latitude 15° S. (the then southern known limit of the east coast of Africa), thus making the Indian Ocean and the seas of the Eastern Archipelago, form one vast Inland sea.—*Rennell's Memoir*, pp. 35, 241; *Cunningham's Ancient Geog. of India*, pp. 9, 31-32. See Buddha, Inscriptions, Kars, Kerkook, Kha-chan-yul, Khuzistan, Kurumbar, Kulzum, Koh, Topes.

PTYCHOTIS MONTANA, *Graham*.

Bhaphullee, *Blyth*.

PTYCHOTIS SYLVESTRIS, *Royle*.

Arab-ajwan.

Grows in the khadir lands of the Saharun-pore district: and used as a stomachic aromatic remedy in flatulence.—*O'Sh.*, p. 358.

PTYCHOTIS COPTICA.

Bal-ajwan, HIND. | Coptic ammi.

A plant of Candia and Egypt, used as a stimulant aromatic.—*O'Shaughnessy*, p. 357.

SANS.
TAM.
TEL.

This is one of the most useful of the Umbelliferae, and an excellent remedy in flatulent colic. Cultivated in India everywhere, much used in India. Flowers small, white, Small fruit. Seeds of an aromatic smell, warm, pungent taste; much used by the natives, for medicinal and culinary purposes.—*Voigt; Roxb.; O'Shaughnessy*, pp. 357-58.

PU, TAM., TEL. A flower.

PUA. The Tibetan name of the marmot.

PU AGAKARA or Potu agakara, TEL. Memordica dioica, *R*.

PUA JETTI, MALEAL. Gomphia angustifolia, *Vahl*.

PUALAIN, or Marmar, MALAY. Marble.

PUAM-CURUNDALA, Conyza cinerea.

PU-AN-KU. According to the Chinese, the primeval man, who came out of the mundane egg: he lived 18,000 years.

PUAR, or Pouar. A highly respectable Mahratta family, at Multan, 30 miles N. E. of Poonah. In the early periods of Mahratta history, the family of Puar appears to have been one of the most distinguished. They were of a Rajput tribe, numbers of which had been settled in Malwa at a remote era; from whence this branch had migrated to the Dekhan.—*Malcolm's Central India*, Vol. i, p. 97.

PUARASU, properly Purasu, TAM. Thespesia populnea, *Linn*.

PUARI, HIND. Ficus caricoides.

PUBB MOUNTAINS, length, about 90 miles, from C. Morze to lat. 26°. Supposed to equal those of W. Sind, viz., 2,000 feet, highest part, about lat. 25° 30' N. In 25° 3' and lat. 66° 50' E., they are crossed by the Guncloba pass, described as stony, and of easy ascent and descent.

PUBERTY, amongst mahomedan girls is called Baligh-hona: p'haili sir mylee hona; also Burron men milna, and amongst the poor and uneducated, its occurrence, in a girl, is celebrated with music. With hindoo, and the non-aryian races, the girl is put outside the house till the time of purification occurs, *Herkl*.

PUBESCENT CUCUMBER, ENG. Cucumis pubescens, *Willd. W. & A*.

PUBHA, MAHR. Chickrassia tabularis, *Ad*. PUBNA, a district and town in Bengal, the town 130 miles from Calcutta, it is a flat, fertile district to the north of Jessore.

PUCHA, MALAY. Putchuck. See Pucha pat.

PUCHA COTTE MARAM, TAM. Sapindus emarginatus.

PUCHA PAT, BENG., HIND. White horehound, Patchouly, used in India, as an ingredient in tobacco for smoking, and for scenting the hair of women. The essential oil is also in common use for imparting the peculiar fragrance of the leaf to clothes, among the superior class of natives.—*Simmond's Dict*.

PUCHA PAYARU, or *Patcha Payaru*, **TAM.** See *Pessaloo*.

PUCHULA—? *Flacourtia cataphracta*.

PUCHCHA, *Cucumis trigonus*, **R. iii**, 722—**W. Ic.** 497.

PUCHKA GADDI, or *Chipuru gaddi*. *Aristida setacea*, **Retz.**

PUCHEESE, **HIND.** A celebrated game amongst the mahomedans.

PUCKA, or *Pukkah*, **HIND.** Mature, perfect, a better class of building in India than the temporary erections. *Pucka-maund*, **HIND.** measure of capacity, equal to 80 lbs. *Puckaseer*, **HIND.** An Indian weight for silk and other commodities, 18,666 lbs.—*Simmond's Dict.*

PUCKEWAR, a thieving race of the Punjab, mahomedans, whom the authorities in 1863 tried to reform.

PUDA GAULA, **BENG.** *Viverra zibetha*, **Linn., Roxb.**

PUDALUNGAI, **TAM.** *Trichosanthes anguina*, **Linn.**

PUDANG, **MALAY.** A sword.

PUDARA, **HIND.** *Erythrina arborescens*.

PUDARI, **HIND.** *Hamiltonia suavcolens*, **Roxb.**

PUDARTHA, **SANS.** from *pada*, a word, and *artha*, an object.

PUDAVAI, **TAM.** *Sarhi*, a woman's cloth.

• **PUDDALUM**, **TEL.** A weight of *Masulipatam*, of 1½ lbs.—*Simmond's Dict.*

PUDDHATI, **SANS.** a road, from *pada*, the foot, and *han*, to smite.

PUDDIEM, or *Payah*, a Nepaul tree, resembles in its leaf and wood, the English cherry, the wood being held in sanctity by the natives; perhaps the *Prunus puddam*.—*Smith's Nepaul.*

PUDDING PIPE TREE. *Cathartocarpus fistula*, **Pers.**

PUDDY, or *Purry*, **DUK.** A dry-measure for grain, consisting of eight ollucks, and forming the eighth part of a marcal. The puddy contains 1¼ English quart, and the heaped puddy weighs about 3 lbs., 8 ozs., 12 drachms. In the Carnatic the puddy is = 3¾ pints; in Madras, only 2¾ pints; as a weight it is nearly 5 lbs.—*Simmond's Dict.* See *Measures, Marcal, Weights.*

PUDEL, **TAM.** *Trichosanthes cucumerina*, **Linn.**

PUDER, **GER.** Hair powder.

PUDERA, **HIND.** *Typha elephantina*.

PUDHA, of Bombay, *Chickrassia tabularia*, **Ad.**

PUDI-KALENGU, **MALEAL.** *Dioscorea aculeata*.

PUDINA, also *Nana*, **GUZ., HIND.** *Mentha viridis*, in the Dekhan, *Mentha crispa*, also *Mentha sativa*, mint.

PUDKALAI, one of the wives of *Ayanar*.

PUDMAK—? *Cerasus caproniana*.

PUDMA PODU, **BENG.** Water-lily, *Nelumbium speciosum*, **Willd.**

PUDMA KURUBEE, **BENG., HIND.** *Nerium odorum*.

PUDMALAYA, or *Padmalaya*, **SANS.** from *padma*, the water-lily, and *alaya*, residence.

PUDMO-GOOLUNCHU, **BENG.** *Cocculus tomentosus*.

PUDMA-NABHA, **SANS.** from *padma*, a water-lily, and *nabhee*, the navel.

PUDMA-PRABHOO, **SANS.** from *padma*, a water-lily, and *prabhoo*, a lord.

PUDO-GAULA, **BHUT.** *Viverra zibetha*, **Linn.**

PUDUNG, or *Padang*, **SANS.** from *pada*, a place.

PUDYAVALEE, or *Padyavali*, **SANS.** from *padya*, prose, and *avalee*, a row, or range.

PUEKOACHIM, **TIB.** Tibet and Bhootan.

PUERARIA TUBEROSA, **DC.**

Hedysarum tuberosum, **Roxb.**

Shimeeya batrajee, BENG.	Saloha,	PANJ. RAVI. TEL.
Sialti,	CHENAH. Siali,	
Badar,	" Duri,	
Sural,	PANJ. Gumudi,	

The tuber.

Bidari kand, **HIND.**

A great climber, a native of the Circar mountains and the Punjab, the bruised root is used as a poultice to swellings of the joints. Its tubers are exported to the plains.—*O'Shaughnessy*, p. 316; *Cleghorn's Punjab Report of Kullu & Kangra*, p. 81.

PUEY, **BURM.** A theatrical representation. The fairs or 'Pueys' are annual gatherings under the pretence of worshipping pagodas of great efficacy. At Thegyain, Shwagyoo and Suseenah, a mile above Bhamo, there is one group of pagodas, the original being founded by Dammasokah! At Suseenah there are 253 pagodas all of a heap. The fair was held on the sands, commenced on the 8th March, and by the 9th, there were at least 2,500 temporary huts, shops and stalls erected. A large place for the Puey and the immigrants enjoy to it, was put up and on each side of it, also a little house for the two chief officials, who remained on duty three days and nights.

PUFFINUS OBSCURUS, the Dusky Petrel of Tropical and South Seas; Australia; rare northward.—*Cal. Rev.*, No. iv, March 1857.

PUG, **GUZ.** A foot, a foot-mark.

PUG CHIK, **LEPCH.** *Alsophila spinulosa*.

PUGGI, a detective who follows up the Pug or foot mark. One was employed to pursue a man who had carried off the plate belonging to a regimental mess at Kaira; he tracked him to Ahmedabad, twelve or fourteen miles, lost him among the well-trodden streets of that

city, but recovered his traces on reaching the opposite gate; and, though long foiled by the fugitive's running up the water of the rivulet, he at last came up with him, and recovered the property, after a chase of from twenty to thirty miles. Pug, in the Kangra dialect also means foot. The skill of many of these Puggees in Guzerat is very remarkable: they measure with a string every trace of the impression of the foot, and make observations with a sense which practice renders very acute. The moment the object of their pursuit is traced to a village, the string and all the remarks are delivered to its Puggee, who pursues the chase till he finds the thief or murderer, or till he lodges him in another village. The numerous instances of extraordinary discoveries of criminals through this mode almost stagger belief.—*Malcolm's Central India, Vol. ii, p. 1920.*—*Elphinstone's History of India, p. 363.*

PUGAREE, an Indian turban-piece of muslin.

PUGHA, see Hot springs, Indus, Kelat

PUGHMAN or Pamghan range, subordinate to Hindoo Koosh, running along its S. base generally from N. E. to S. W. Estimated at 13,000 feet. Oona pass $34^{\circ} 23'$ and $68^{\circ} 15'$; 11,320 feet. Brak summit $34^{\circ} 40'$ and $68^{\circ} 48'$; 12,480 feet. Always covered with snow. Its south-eastern brow overhangs the delightful region of Koh-i-damaun and also Cabul: its northern face forms the southern boundary of the Ghorbund valley.

PUHARI or Pahari, HIND., a mountaineer; those on the Eastern end of the Vindhya range are said to be admirably adapted for soldiers, and to be very fond of the profession. Having no caste, and eating any food indiscriminately, they would be available for foreign service at a shorter notice than any hindoo could be; accustomed to mountains and jungles, they would be extremely valuable on the eastern and northern frontier, as well as on the Nerbuddah and in Berar. Those whom Bishop Heber saw, were middle-sized, or rather little men, but extremely well-made, with remarkably broad chests, long arms, and clean legs. They are fairer, than the Bengalees, have broad faces, small eyes and flattish, or rather turned up noses; but the Chinese or Malay character of their features, from whom they are said to be descended, is lost in a great degree on close inspection. The expression of their countenances is cheerful and intelligent.—*Heber's Journal, Vol. i, pp. 207-8, 214.*

PUHARI CHERETTA, HIND. Ophelia.

PUHDUN, HIND. Mako.

PUHOOG, a river near Ukdeo in Banda.

PUHN. MALAY. A tree.

PUI, BENG. *Basella cordifolia, Lam. B. alba, Linn., Roxb.*

PUIMANGU of Kashmir, a dealer in shawl wool yarn.

PUIN SHAK, BENG. *Basella cordifolia, Linn.*

PUJ, HIND. A devotee.

PUJA, BENG., HIND., SANS., TAM., TEL. Worship of the Almighty or of idols. Hindoo worship, or the festival of the hindoos, as Durga puja, is the worship of the goddess Durga. It assumes various forms, and is attended by a variety of ceremonies according to the deities worshipped, and the circumstances under which the worship is performed.—*Cole. Myth. Hind., p. 392.*

PUJA KAND, HIND. See Prajna.

PUJALI or Pujari, HIND. Any worshipping priest. The officiating brahmin or priest of a temple, an inferior priest. See Hindu or hindoo.

PUJAWALIYA, a book of legends in Singhalese, relating principally to Gotama budha.—*Hardy's Eastern Monachism, p. 440.*

PUKANA, HIND. *Rubus floribundus, R. rotundifolius.*

PUKANDEL, TEL., TAM. *Rhizophora mangli.*

PUKAT, a Chinese trading vessel employed in the Eastern seas.—*Simmond's Dict.* See Prahau.

PUKEO, a money of account in the island of Lombok, equal to 5 attacks or 1000 cash; about 9 shillings.—*Simmond's Dict.*

PUKHA, BENG. *Hedyotis pumila.*

PUKHAL, HIND. A large leather bag for water, carried on bullocks.

PUKHALI, HIND. A water carrier in pukhals or skins slung on bullocks.

PUKHAWAJ, HIND., a kind of drum, a timbrel.

PUKHI, TEL. *Epicarpus orientalis, Blume.*

PUKHLI, see Sikhs.

PUKHTO, or Pukhtun, or Pushtoo, the Affghan language.

PUKHYA PAKYA, MAHR. *Pteromys philippensis, Elliott.*

PUKKI, TEL. *Epicarpus orientalis, Blume.*

PUKRAIR, a stream near Mungawa in Jubbulpoor.

PUKRIAR, a river of Rewah.

PUKSHADHARA-MISHRA, SANS., from puksha, a lunar half month, and dhara, to hold.

PULA, HIND. *Kydia calycina.*

PULA, HIND., of Kulu, grass sandals.

PULACHA-KIREY, TAM. *Hibiscus cannabinus, Linn., Roxb., W. & A.*

PULAIMAKAN, a Tamil term, applied to a Paraiya or Pulaya, *Wilson.* See Pariah.

PULAI NAMAJI, TAM., of Coimbatore. *Crotalaria juncea, Linn.*

PULAKH, HIND. *Ficus cordifolia*.
PULA KURUVU, MALAB. *Anamirta cocculus*.

PULA MARAM, TAM. *Salmaal malabarica*.

PULA MULA ELAVU, TAM. *Bombax malabaricum*.

PULANG-KELENGU, TAM. *Curcuma zerrumbet*.

PULANTU, BENG. *Allium cepa*, *Linn.*

PULA PALLA, TEL. *Pentatropis microphylla*, *W. & A.*

PULA PATTAI, TAM. Bark of *Phyllanthus multiflorus*.

PULASA, also Kinaka, BENG. *Butea frondosa*, Pulas fibre, see Dhak. Pulas flowers, see Dyes.

PULAS KINO, see Dyes, Kino.

PULAS, see Kaluwi.

PULAS, HIND. *Butea frondosa* and *B. superba*. Their fibre is used for cordage, or beaten to a kind of oakum, for caulking boats. It is also called dhak. The flowers are used for dyeing.—*Simmond's Dict.*

PULASTYA, a famous rishi. See *Brahmadica*, Hindoo, Ravana.

PU-LA-TE, a wandering tribe found on the island in the Baykal lake and an account of them is given by Mr. Bell. He says the tribe are natives of Siberia and differ in some particulars from all he had formerly described. They are called by the Russians Brustky, but by themselves Buraty. They live in tents all the year; and, having large flocks of sheep and many cows and horses, they remove from place to place, as the convenience of grazing requires. Their language has a great affinity to that of the Calmucs; and they have priests among them who can read and write that language.—*Staunton's Narrative*, pp. 51-2.

PULA TUMMI, TEL. *Leucas linifolia*, *Spreng.* *Phlomis zeylanica*, *R. iii*, 9.

PULAYAN, or Pulian of Malabar, is a low and servile caste, often slaves. This is doubtless the Pullai.—*Wils.*

PULCHA KIRE, TAM. *Hibiscus cannabinus*, Ambari.

PUL-COLLI, Rheed. *Rhinacanthus communis*.

PULCHI FIBRE, of Madras, Ambari, DUK., MAH. *Hibiscus cannabinus*, *Linn.*, *Roxb.*, *W. & A.*

PULEETA, HIND. A lamp charm.

PULE MANJI, or Pule namajee, in Coimbatore, Crotalaria juncea.

PULGOONDHUN, HIND. The plaiting of a girl's side locks, a mahomedan ceremony.

PULI, or Pulli, TAM. *Tamarind*.

PULI, HIND. *Kydia calycina*.

PULI, TEL. *Crinum pratense*, *Herb. C. longifolium*, *R. ii*, 130.

PULI, TEL. *Felis tigris*, *Linn.*, the tiger.

PULIA MARAM, TAM. *Tamarindus indica*.

PULIAR. The Kader as also the Puliar, Malai arasar and Muduwar, who also inhabit the Animallai hills, all gather the rich natural products of the forest, cardamoms, honey, wax, ginger, turmeric, resins, millets, soap-nuts, gallnuts, and exchange them in return for rice and tobacco. The Puliar, who inhabit the forests and mountainous districts of the Malabar coast were long regarded by the settled inhabitants as inferior to the beasts of prey and were not even permitted to erect houses for themselves. A shed supported on four bamboos and open on all sides, sheltered them from the rain, but not from the inclemency of the weather. They dared not venture on the public road lest their steps defile it; and when they perceived any person approaching them from a distance, they were required to utter a yell or loud cry and make a wide circuit to let him pass. See Puller.

PULIARI, TAM. *Oxalis corniculata*.

PULIARI KIRE, TAM. Greens of *Oxalis corniculata*.

PULICARIA, a genus of plants belonging to the natural order Asteraceae.—*Eng. Cyc.*

PULICAT, properly Palivara-Kadu, a small town on the eastern coast of the peninsula of India about 20 miles north of Madras, which gives its name to a marine lagoon about 80 miles long. It is close to the village of Coromandel, which, again, gives its name to the coast of the eastern side of the peninsula of India. The flagstaff is in lat. 13° 25' N.

PULICAT LAKE, is a marine lagoon, skirting the Bay of Bengal, near Madras, on the north, in the Nellore collectorate. It is about 40 miles long and several broad, with many islets in the centre.

PULICAT SHOALS, lat. 13° 25' N., long. 80° 18' E.

PULICHI, a forest tribe in Malabar, who are deemed so unclean that they are not allowed to approach other castes.

PULI CHINCHALAMU, or Puli chinta, TEL. *Oxalis corniculata*, *L.*—*R. ii*, 457, *W. Ic.* The same term is also applied by Colonel Beddome in the Godaveri forest to a species of *Bauhinia*. See Puli-Shinta.

PULI DUMPA, or Pedumpa, TEL. *Dioscorea dæmona*, *R.*

PULI MADA, or Kannem, TEL. *Vitis pedata*, *Wall.*

PULIM, SINGH. *Eriodendron anfractuosum*, *DC.*, *W. & A.*, *W. Ic.*

PULI MARAM, TAM. *Salmaal malabarica*, *Bombax malabarica*, also ? *Vitis setosa*, *Wall.*

PULINDA, see Chandra.

PULI PALLAM, TAM. Tamarind fruit of *Tamarindus indica*, *Linn., Roeb.*

PULI-SHINTA, TAM. *Bauhinia*, *species*. A wood of the Godavery forests. Said to be good and hard. Tree not apparently described. Legume filled with a scented pith.—*Captain Beddome*.

PULI TODUGU, TEL. *Pterolobium lace-rans*, *Br.*—*W. A.* 877—*R. ii*, 367, a plant of the Nagari hills.

PULI VELAGA or Velaga, *TEL.* *Feronia elephantum*, *Corr.*

PUL KOLLI, MALEAL. *Rhinacanthus com-munis*, *Nees*.

PULLA, HIND. *Rubus tiliaceus*.

PULLA, HIND. A kind of carp in the Indus and Ganges rivers, of delicious flavour, only found in the four months that pre-cede the periodical swell of the river. The pullah, called by the Sindees "pallo," is the hilsah of the Ganges, the sable, or black-fish. The usual weight is about two pounds, and the body averages twenty inches in length, the finest are found ascending the river as far as Bukkur, between January and April. The Pullah fish is rarely, if ever, caught above the island of Bukkur it cannot swim against such a stream.—*History of the Punjab*, Vol. i, p. 8; *Burton's Scinde*, Vol. ii, p. 256.

PULLA BACHCHALI or Barre bachchali, *TEL.* *Vitis setosa*, *Wall., Heyne*.

PULLA CHANCHALI, or Puli chinta, *TEL.* *Oxalis corniculata*, *L.* The term Pulla or acid is applied both to this and *V. auriculata* and Bachchali to *V. Setosa* the leaves of which are very acid. The Sans. syn. is *Atyamla parna*. *W.* "a creeping medicinal plant." It means very acid leaves.

PULLADABBA or Dabba. *Citrus medica*, *L.*

PULLA DANIMMA, or Dadima. *Punica granatum*, *L.*

PULLAH, a commercial weight in India, ranging in different localities, from 138½ lbs. to 325½ lbs. There is a difference in buying and selling, for instance a selling pullah will be 120 seers, or 240 lbs. 6 oz. 9 drachms; and a pur-chasing pullah, 126 seers, or 252 lbs. 6 oz. 14 drachms.—*Simmond's Dict.* See Measures, Weights.

PULLA MADIPHALA CHETTU. *Citrus*, *var.* Pulla means acid.

PULLAMANDA, or Bachchali manda. *Ceropegia tuberosa*, *R. C. juncea*, *R. Cor.* 10, from the resemblance of *C. juncea* to *Sarcos-temma acidum*, it is not improbable that some confusion of names may have arisen. *Tujya-manda*, was also a name applied to an undescribed Euphorbiaceous plant of a very large tuberous root from the Golakonda Taluk in Vizagapatam a congener the plant figured and described by Wight under the name of

Jatropha villosa. *V. peltata*, *lc.* 1169.—Sweet Mande is *C. tuberosa*.

PULLA MILLU, TEL. Vinegar.

PULLA PAMPARA PANASA, TEL. *Citrus decumana*, *Linn., W. & A., Roeb.* (acid var.)

PULLA PASSAONA, HIND., or 'spreading the cloth or scarf,' is the figurative language of entreaty arising from the act of spreading the garment, preparatory to bowing the head thereon in token of perfect submission.—*Tod's Rajasthan*, Vol. ii, p. 283.

PULLA PAVILI, TEL. *Portulacca*, *sp.*

PULLA PUMPARA PANASA, TEL. *Citrus decumana*, *L.*—acid var.

PULLA PRABBA, TEL. *Calamus*, *sp.* Sans. syn. is *Amla vetasa*. Both words mean "acid cane." The fruit of *C. rotangis* is very acid and eaten by natives, another syn. *Sata vedhi*, *W.*, is, also *Rumex vesicarius* also *Oxalis*.

PULDA TOVARI MANNU CHETTU, or Pulla tige or Soma lata, *TEL.* *Sarcostemma acidum*, *S. brevistigma*, *W. cont.*, *S. Viminale*, *R. Br. Asc. acida*, *R. ii*, 31.

PULLEE, see Khyber.

PULLER, TAM. A race of predial slaves in the south west of the Peninsula of India, until recently held in great disesteem by neigh-bouring races. The Puller race in the south of India, are supposed to have formerly been in a state of slavery but their position now is solely dependent on their wealth. Both men and women work well, take part in all agricultural labour, the women, in this particular, vying with the men. The Puller women go about with their chests exposed, and as a rule cannot be induced to cover their breasts. Previous to British rule the Puller who inhabited the forests and moun-tainous districts of the Malabar coast were re-garded by the settled inhabitants as inferior to the beasts of prey and were not even permitted to erect houses for themselves. A shed sup-ported on four bamboos and open on all sides, sheltered them from the rain, but not from the inclemency of the weather. They dared not venture on the public road lest their steps should defile it; and when they perceived any person approaching them from a distance, they were required to utter a yell or loud cry and make a wide circuit to let him pass. The Puller in Tinnevely are the hereditary slaves of the wealthier classes. They are the lowest hindoo grades of the right hand caste. The Puller, where settled are allowed to be able cultivators, small farms and kitchen gardens. They bury their dead, have pujaris of their own castes.—*Wilson; Campbell*, p. 133. See Puliar.

PULLERU, TEL. *Croton claviferum*.

PULLERU or Pallru kuru, *TEL.* *Tribulus terrestris*.

PULLI, HIND. *Kydia calycina*.

PULLI, see India.

PULO ADI.

PULLICATES. Cotton checked handkerchiefs, of various colours.—*Paukner*.

PULLIYAR or Pullar or Pulayar out caste tribes, classed with the Paraiyar.—*Wils. Gloss.* See Puller, Puliar.

PULLUGHOOSHUTTUM, TAM. Civet, Eng., Dut.

PULLUKKAI, TAM. A slave.

PULLUNG or Palang, HIND., PERS., a cot, a bed, a bedstead.

PULLUNG POSH (corrupt palampore) a coverlet.

PULMONIFERA an order of molluscs, see molluscs.

PULMU, HIND. *Viburnum foetens*.

PUL-MARAM, TAM. *Bombax malabaricum*.

PULNA, HIND. *Hibiscus cannabinus*, *Linna.*, *Roth.*, *W. T. A.*

PULNEY, a town that gives its name to a spur of the western range of mountains which runs out boldly into the Madura district, and on which a sanitarium is growing up. The town of Pulney is situated to the north of this range of hills. A festival is annually celebrated there and the worshippers of the idol Subramaniya crowd to the place with delight and devotion. On approaching the town from the east, the attention of the traveller is attracted by two massive rocks lying to the south, and about half a mile distant from the road, and from each other. The elongated one to the east is named Idumba hill, and has scattered about on its summit detached boulders and large stones. The second larger and rounder mass is the more famous Pulney rock, the summit of which is crowned by a temple. During the whole of the long hot day, and for ten days in succession, there is a clatter and din of tom-toms, accompanying different parties up the rock to the shrine of the divinity. The natives in almost endless gliding lines of red and dark-brown, mixed with gleams of white, move on their winding way up the hill and round the temple. From them comes the ceaseless hum of distant voices, like the surging of the restless sea; save when, midst a beating of drums and braying of trumpets, the devotees cry out Harakara—meaning Oh! Siva! great Siva!—in praise of their deity. Even after darkness covers the rock with its curtain, the hubbub continues. The local name of the god is Pulney Andi, but he is also recognized under the various names of Dandaythapani (wielder of the spear), Arumugam (six faces), and Cartikeia (the god of war.) His Puranic name is Skanda. He is the youngest son of the god Siva, and the hero of the Skanda Purana.

PULO, MALAY. An island.

PULO ADI, MALAY. Ai, an island of the Moluccas, the Pulo Ai of the Malays, Pulo Way

PULO CEICER DE MER.

of the British, is situated about ten miles to the westward of the Banda Lenthor or Great Banda. It is about 8 miles in circumference, and moderately elevated, its entire surface consisting of nutmeg plantations, this spice being its sole exportable product.—*Jour. Ind. Arch.* See Adi island.

PULO AI, see Ai island, Pulo Adi.

PULO AOR or Wawoor, is in lat. $2^{\circ} 29'$ to $2^{\circ} 30'$ N., long. $104^{\circ} 34\frac{1}{2}'$ E. in the China Sea, is small, but high and covered with trees. It is formed of two hills separated by a gap, which gives the appearance of two islands. The inhabitants are considered treacherous.

PULO BESSY, Bezee or Tamarind island, is about $10\frac{1}{2}$ or 12 miles N. E. $\frac{1}{2}$ E. from Crocoatoa peak, and also has a peak 2,825 feet high.

PULO BOONG OORAN, see Natunas islands.

PULO BOUTON, lying off the Malay coast, is formed of two large and high islands, the easternmost being formed of a regularly sloping mountain, generally called Bouton dome, visible 50 to 55 miles. It is in lat. $6^{\circ} 33'$ N., long. $99^{\circ} 20\frac{1}{2}'$ E.

PULO BRALA or Capas de mer, 18 or 20 miles off the E. coast of the Malay peninsula, in lat. $4^{\circ} 47'$ N., long. $103^{\circ} 37'$ E., is an island of considerable size.

PULO BRANI, an island near Singapore occupied by a race of settlers known as the Bugis of Wadju, and employed as pine apple planters and fishermen. The women manufacture the Sarongs, a gold and silk fabric and coarser articles. They are mahomedans, but drink the fermented juice of the pine apple. Their features are regular and open, their faces inclined to an oval, eyes large and dark and are much elevated. Women have oval face and very perfect figures, but at puberty, their teeth are filed close to the gum.—*Dr. J. S. A. Little*.

PULO BRASSE, in its north end is in lat. $5^{\circ} 45'$ N., long. $95^{\circ} 6\frac{1}{2}'$ E., bearing from Pulo Rondo about 21 miles south by west. Pulo Brasse and Pulo Nancy or Nantee nearly join each other, and are the principal islands of the group near Acheen head.

PULO CAMBING or Passage island, in the Straits of Timor is about 11 miles long.

PULO CAPAS DE TERRE, or Capas Danat, in lat. $5^{\circ} 15'$ N., a rather low island, off the E. coast of the Malay peninsula.

PULO CARA, in lat. $8^{\circ} 29'$ N., in the Gulf of Siam, is formed of a group of three islands contiguous to each other.

PULO CARNOM, in the Gulf of Siam, 90 miles from Pulo Cara, is in some parts high land.

PULO CEICER DE MER, 36 miles S. by

PULO MANCAP.

E. from Pulo Ceicer de Terre, is 5 miles in extent.

PULO CEICER DE TERRE, called Hon-Cau, by the natives, is a low island in the China Sea, on the coast of Tsiompa.

PULO CHIKUKOH. A little island near Singapore.

PULO COCUB, $13\frac{1}{2}$ miles from Pulo Pisang, is a low flat island, close to the Malay shore.

PULO COMBA or Cambay, a high round island, about 2 miles in extent 36 miles N. E. of Flores Strait, in lat. $7^{\circ} 49' S.$, and long. $123^{\circ} 41' E.$

PULO CONDORE or Kiounlun, consists of several islands on the coast of Cambodia which abound with timber.

PULO DATTOO, in lat. $0^{\circ} 7' N.$ and 30 or 33 miles E. by S. from Direction Island, in the China sea, is high and of an oblong form.

PULO DELLI or Klapper Island, on the S. coast of Java, from which it is distant 8 miles. It is very low and covered with trees.

PULO DINDING, in lat. $4^{\circ} 16' N.$, a high and woody island, 62 miles S. S. E. of Penang.

PULO DOMAR, in the China sea, is a high barren rock, in lat. $2^{\circ} 45' N.$, long. $104^{\circ} 23' E.$ and 49 miles E. from Pulo Aor.

PULO ENGALING, see Rigas Islands.

PULO GASSES, 7 or 8 miles from Looki Song in the Gillolo passage, is in lat. $1^{\circ} 41' S.$, and long $128^{\circ} 20' E.$, and 5 miles east of Amboina.

PULO JACKEE, or Noosa Nessing a small island about 3 miles off the east point of Timor, in lat. $8^{\circ} 25' S.$, and long. $127^{\circ} 16' E.$

PULO JARRAH, in lat. $4^{\circ} 0' N.$, long. $100^{\circ} 12' E.$, bearing 78 miles south from the centre of Penang, is small, covered with trees and may be discerned about 21 miles.

PULO JERAJAH, see Penang.

PULO MANOK, see Keffing Islands.

PULO LACUTTA, in lat. $1^{\circ} 50' N.$, long. $98^{\circ} 7' E.$, a small low island on the west coast of Sumatra.

PULO LAUT or Laurot Islands, are mostly high and form a group on the south coast of Borneo, stretching from lat. $4^{\circ} 43' S.$, to $4^{\circ} 57' S.$ Great Pulo Laut, at its north end, is in lat. $3^{\circ} 13' S.$ and long. $116^{\circ} 41' E.$, and is moderately elevated on its eastern side.

PULO MAJO, or Mayo, in lat. $8^{\circ} 6\frac{1}{2}' S.$, long. $117^{\circ} 47' 24'' E.$, fronts the gulf of Salee on the north coast of Sumbawa.

PULO MANCAP, Muncoo or Mankokh,

PULO UBI.

a small low island on the S. W. coast of Borneo, in lat. $3^{\circ} 5' S.$ and long. $110^{\circ} 11' E.$

PULO NYAS or Nias, is the largest of the islands off the west coast of Sumatra, being 18 or 21 miles in breadth. In general, the land is high, well clothed with trees and partly under rice cultivation. It was formerly well inhabited; but many of the inhabitants were formerly purchased for the Dutch settlements at Batavia, the women being fairer than those of the adjoining coast.

PULO OBI or Oby, an island in the Gulf of Siam, in lat. $8^{\circ} 25' N.$, long. $104^{\circ} 25' E.$, is several miles in extent, with a high mountain in its centre.

PULO PANJANG, lat. $9^{\circ} 18' N.$, long. $103^{\circ} 36'$. Placed on Admiralty chart about eighteen miles too far west.

PULO PAPAN, in lat. $1^{\circ} 32' S.$, on the west coast of Borneo, forms two small groups of which the east island is the largest.

PULO PENANG, Penang, or Prince of Wales Island. See Penang.

PULO POOGALISE, see Rigas Islands.

PULO POPA, in the Pitt passage, and in about lat. $1^{\circ} 12' S.$, long. $129^{\circ} 52' E.$, is inhabited, and including its contiguous isles, extends east and west 15 or 18 miles.

PULO RAMIO, see Penang.

PULO REPON, or Saddle Island, in lat. $2^{\circ} 24\frac{1}{2}' N.$, long. $105^{\circ} 25' E.$, is the south-west detached island of the Anumba group in the China Sea.

PULO RONDO, in lat. $6^{\circ} 4\frac{1}{2}' N.$, and long. $95^{\circ} 12' E.$, is the most northern of the islands of Achcen, it is a high perpendicular rock of a round form.

PULO TIMOOANS, Tiomam or Teoman, an island in the China Sea, about 11 miles long, from north to south, its south end is in lat. $2^{\circ} 43' N.$ Firewood and refreshments may be had here.

PULO TINGAY, in lat $2^{\circ} 17' N.$, long. $104^{\circ} 11' E.$, 24 miles W. S. W. from Pulo Aor, in the China Sea, is conspicuous for a peak on it 2,046 feet high.

PULOTINJIL or Trowers Islands, is 12 miles distant from Klapper island, on the south coast of Java.

PULO TOOJOO, i. e., seven Islands, lie in two groups extending eleven miles in latitude, in the tract from the Straits of Banca to the China sea, the latitude of the most northern is in $1^{\circ} 7' S.$, long. $105^{\circ} 24' E.$ They are all covered with trees except the most westerly.

PULO UBI, a high hilly island in lat. $8^{\circ} 55' N.$, and long. $104^{\circ} 54' E.$ It is covered with forest.

PULSUNDRA.

PULSES are largely used in the E. Indies as the food of man and beast. They are eaten with, and supply to rice, and some other cereals, the nitrogenous or 'flesh-forming' material in which these are defective. The generic name in Malay and Javanese for all leguminous plants, is kachang, by adding an epithet to which we have the name of the species. Several species are regular objects of cultivation, as *Phaseolus max*, *lunatus* and *radiatus*; *Dolichos kachang*; *Labiab vulgaris*; *Soja hispida*; *Cytisus cajan*, and *Arachis hypogea*.

[illegible]

Labiab vulgari	icety	
Do.		
Ervum lens..		
Trigonella Fœ	im	reel
Cajanus bicolor..	
Cajanus indicus..	variety	Piç

Pisum arvense..		Wild pea..
Cyanopsis pectoradi		
Faba vulgaris..		

The ordinary pulses belong to the tribes Viciæ and Phaseoleæ of the order Fabaceæ. All the cultivated varieties of beans have originated from *Faba vulgaris* ; all the varieties of garden peas have originated from the *Pisum sativum*, a native of the south of Europe, and the field pea is the *Pisum arvense*. The flour of lentils contains more nitrogenous matter than any other of the leguminous plants.—*Cat. Eco.* 1862 ; *Crawford's Dict.*, p. 361.

PULSU, TEL. Acetic acid.

PULSUNDR, TEL. This Nalla Mallai

PUMICE STONE.

PUN.

wood is of a reddish colour, strong and useful.
—*Mr. Latham.*

PULUCK MUTE, a river near Sohagpoor in Hoshungabad.

PULUHA, see Brahmadicas.

PU-LU-SHA-PU-LO, or Parshawar, capital of Gandhara.

PULUT, MALAY. A kind of rice. It is boiled in a bamboo joint by the Malay and Dyak races of Borneo. Considered as a delicacy and much prized for its nutritious qualities.

PULVER, also Schiesspulver, GER. Gunpowder.

PULVIS PYRIUS, LAT. Gunpowder.

PULWAR, is a smaller description of Ganges boat than the Puteli, and of neater build. It is used by natives in travelling, by European travellers of humbler means, or as a cook-boat, or for servants. See Boats.

PULWUL, HIND. *Trichosanthes anguina*.

PULWUL, BENG. *Trichosanthes dioica*. Dicoecious snake gourd, is a small snake gourd the size of an egg; the seed is sown in the cold season and yields fruit from March to September.—*Riddell*.

PU-MARAM, TAM. *Schleichera trijuga*, Willd.

PUMBA, or Pamba, PERK. Cotton.

PUMEX, LAT. Pumice stone.

PUMILIMAS PALLAM, TAM. *Citrus decumana*, the shaddock.

PUMMALO, *Citrus decumana*, Linn., W. & A., Roxb. The shaddock. It has been ascertained that the mango, orange, pummelo, sweet lime, bilimbi and guava all bear pruning of the old wood, and that they produce much more fruit in consequence. Old branches if cut off the mango near its base are apt to produce canker in the trees, unless the cut surface is protected from the air by tar or white paint.

PUMICE STONE.

Pierre ponce,	FR.	Batu-timbul,	MALAY.
Bimstein,	GER.	Piedra pomez,	SP.
Pietra pomicæ,	IT.	Poosa-rui,	TEH.
Pumex,	LAT.		

A light spongy, vitreous stone, found usually in the neighbourhood of volcanoes, and supposed to be a lava or volcanic glass. It is used for polishing metals and marble, and smoothing the surface of wood and pasteboard. Pumice is quarried and exported in large quantities from Lipari and the Isles Ponza, in the Mediterranean. Pumice stone in small pieces and very hard is found on the sea coast near Nizam-patam. Numerous fragments of white pumice are found on the north-east point of Battam, and within the Singapore Strait or Pulo Sambo, called by Malays Batu timbul, or floating stone, who say it is found floating on the China sea and scattered on the beaches of the eastern coast of Johore. It is possibly from the Phi-

lippines. The pumice of the great Tomboro in Sambawa is blackish.—*Faulkner; Rohde's MSS.*

PUMP. In India, a number of trials have been made of different appliances for raising water as Belt, Lift, Chain and Rope Lift pumps, Hand, force, and garden-watering pumps, but on comparing the working of these with the ordinary Pecottah, it is ascertained that the Belt Lift pump only raises water to about 12 feet, and that steam power is requisite to keep up the velocity. The Chain and Rope Lift pumps work satisfactorily to a depth of 30 feet, but in deep wells the labor of raising the water is considerable.

PUMPALIMAS CHEDDI, TAM. *Citrus decumana*, Linn., W. & A., Roxb.

PUMPKIN, *Cucurbita pepo*.

Kaddoo,	HIND.	Laboo pringi,	MALAY.
Mitha kaddoo,	"		

This vegetable is grown in great abundance in all parts of the Deccan. It is much esteemed both by the Europeans and natives. It is generally sown at the commencement of the rains, and requires no particular care; the soil should be light and good. When young, about the size of a goose egg; if cut and boiled, it will be found to resemble the artichoke-bottom dressed in the same way.—*Riddell*.

PUMPKIN, white, the *Lagenaria vulgaris*, Ser., and the *Benincasa cerifera*, are sometimes so called, B. *cerifera* is also called the white gourd, or white pumpkin. The Karens and Burmese cultivate a species of pumpkin or gourd, never eaten by Europeans, which they esteem a valuable addition to their curries.—*Mason*.

PUMPKIN PAGODA. In ascending the Irrawaddy river, close to the river bank, is a small temple, but of most original shape, looking like a great pumpkin with the thick end uppermost and a single spire rising from the top. This pagoda stands on a terrace of white-washed work, encompassed down to the water's edge with a succession of concentric sloping walls and parapets crowned with trefoils. Behind is a small shrine containing a carved and gilded image, covering it was a brick 'Theing' with a pyramidal many storied spire, the latter edifice executed with an accuracy and richness of ornament unusual in modern Burmese brick work. The whole as seen from the river might pass for a scene in another planet, so fantastic and earthly was the architecture.—*Fule*.

PUMPLEMOSE, ENG. *Citrus decumana*, Linn. The Pumplemosc, or Pomelo, called shaddock, is abundant in nearly all parts of the East Indies.

PUMPLEMUS, MALAY. *Citrus decumana*.

PUN, HIND. *Jatropha curcas*.

PUN, SINDI, the leaves of *Typha elephantina*, used for making mats and baskets.

PUN, nominal species of currency in India calculated by cowry shells; in Hindostan, a handful or about 80 shells; five pun or 400 cowries making an anna or $1\frac{1}{2}$ d.—*Simmond's Dict.*

PUNA or Poon. This wood is commonly called Peon in England. It is used for masts, yards, &c. That of Ceylon is of good quality, and superior to that of Malabar; but, from its small dimensions, its scarcity, and the trouble in obtaining it, is of little consideration. The largest said to have been found was eighteen inches in diameter, and sixty feet in height; but the largest Edye could discover was not more than nine inches in diameter, and thirty-five feet high. In quality it is much the same as the first sort in Malabar, which in the early part of the 19th century could be obtained at Mangalore from the native merchants at all times when the coast is open, (viz., from November to April) of three feet in diameter, and one hundred and ten feet long for the sum of 150*l.* sterling.—*Edye, Ceylon.*

PUNA, HIND. *Ehretia serrata*, a small tree with a white, hard, heavy, strong durable wood used by zemindars for their houses and implements. Leaves given as fodder to cattle. Wood not much valued.—*Powell's Hand-book, Vol. i, p. 541.*

PUNA, HIND. *Saccharum violaceum*.

PUNA BALLE in Tamil, and Punga maram in Malayala, *Pongamia glabra*, a beautiful tree and of much value; it grows to about two and a half feet in diameter, and from ten to fifteen long, spreading its branches to a great extent, and into curves of various dimensions, which are valuable for native uses, particularly in building country vessels. It produces a fruit from which oil is extracted, and used for lamps, &c. The Arabs prefer this oil to any other to mix with chunam, for the purpose of covering the bottoms of their vessels to preserve them from worms; it is also used for the purpose of curing rheumatic pains, by being applied warm with friction.—*Edye, M. and C.*

PUNAC, SINGH. Coconut oil. See Coconut palm.

PUNACHA, —? near Kashmir.

PUNACHU, TEL. *Hydrilla verticillata*, *L. C. Rich., R. iii, 578 and 751.* The names with Pachi and Nachu, &c., are used indifferently for all sorts of herbaceous aquatic plants.

PUNAG, CAN. Female tree of *Calysaccion longifolium*.

PUNAGA, SANS. *Calophyllum inophyllum*.

PUNAG CHAMPA, BENO. *Alpinia nutans*, *Roscoe.*

PUNAGHATTI KI BHAJI, HIND. *Illecebrum sessile*.

PUNAGHENTI KURA, TEL. *Illecebrum sessile*.

PUNAGHATTI KI BHAJI, HIND. *Punagheuti kura, TEL., Illecebrum sessile.*

PUNAGIN BEK, CAN. *Viverra malaccensis*.

PUNAGU-PILLI, TEL. *Viverra malaccensis, Gmel., Blyth.*

PUNAJIN BEK, CAN. *Viverricula malaccensis, Gm.*

PUNAJIN PILLI, TEL. *Viverricula malaccensis, Gm.*

PUNAK, SINGH. Refuse of the cocoanut, after expressing the oil, used for cattle and poultry. Coconut oil.

PUNA KAD, in Salem, Kumari, CAN., of Mysore and Canara, is the Ponnam of Malabar, the Chena of Ceylon, and the Tungya of Burmah, and is a rude system of culture followed in all these countries, wherein secluded tribes and others clear parts of the forest. The Irular races and Kurumbar on the Neilgherries, the Malai, also, on the Shevaroys, the Punam cultivators in Malabar, the kumari cultivators of Canara, and the Karen in Burmah, all endeavour to obtain a precarious subsistence by scattering grain after burning the jungle, and thus avoid, to them, the irksome restraints of civilized life. The kumari cultivators earn a cheap, but wretched subsistence and live in miserable huts. A hillside is always selected, and at the close of the year a space is cleared. The wood is left to dry till the following March or April and then burned. The ground is then sown with Italian millet, *Panicum italicum*, as also with rice, *Oryza sativa*. In Canara, the seed is generally sown in the ashes on the fall of the first rain, without the soil being touched by a plough. It is fenced and weeded, and the crop gathered towards the end of the year. A small crop is taken off the ground in the second year and sometimes in the third, after which the spot is deserted, for 7, 10, or 12 years, until the jungle grows sufficiently high to tempt the tribe to renew the process. In Ceylon, the Chena lasts two years, and includes the culture of chillies, yams, sweet potatoes, cotton, hemp, &c. About the middle of the nineteenth century in Bekal, the most southern taluk of Canara, 25,746, or one-sixth of the rural population were engaged in it, but north of that taluk, it was carried on by the jungle tribes of Malai Kaders and Maharatai to the number of 59,500. Kumari was then prohibited in Mysore and put under great restriction in the Bombay presidency, and the Madras Government, in 1860, prohibited it in Government forests, without special permission, which they commanded to be given sparingly, and never in timber spots. Mr. Cannan, a coffee planter of Wynaad, says that in a spot thus treated, only plants re-grow unfit for and

building purposes, and he had never been able, to get coffee to grow on it.—*Dr. Cleghorn in Reports to the Madras Government, 1868, &c., Cleghorn's Forests and Gardens of India, p. 126.*

PUNAL, HIND. *Oxylaphus himalaicus*.

PUNAMALLEE, Lat. N. 13° 3'; L. 80° 7', E. in the Carnatic, a large military station, 12 miles W. of Madras. Dak bangalo, 89 ft., *Schl. Rob.*

PUNA MARAM, TAM., see *Calophyllum*.

PUNAMBAY WOOD, ANGLO-TAM. *Prosopis spicigera*.

PUNAR, a river of Purneah.

PUNAREE, a river near Maharajpore in Dumoh, also a river near Bhamanee in Nur-singpoor.

PUNAR JANMA, see Hindoo.

PUNARNAVI, SANS. *Trianthema*.

PUNATSU, TEL. *Myriophyllum verticillatum, Linn.,* or *Valisneria verticillata*.

PUNATU, SINGH. Is the dried pulp of fruit of the palmyra tree, dried in the sun, then smoked in the houses, and eaten as cakes, for soup or in curry. The centre and its top are soft and spongy, containing a kind of coarse farina, intermixed with the under fibre, and in Ceylon, these parts are laid out to attract for the sportsmen, hares and wild hog.—*Tennent's Ceylon*.

PUNA-VERI, TAM. *Cassia sophora*.

PUNDARIKAMU, or Tellani padmamau, *Nelumbium speciosum, Willd, β—Album, SANS. Pundarikah, IV.*

PUNAWA, a village, is situated 14 miles to the eastward of Gaya, between two hills of grey granite. To the north there is a fine old square tank called Budhokar-tal, and to the east another tank called Karamar tal. The principal object is a pillared temple of Trilok-nath.—*Bengal Asiatic S. Journal, No. 32, 1864.*

PUN, BASTARD, MAHR. *Sterculia fetida*. See Poon.

PUN BURI, SINDEE. Bulrushes. See Ty-phaceæ.

PUNCH or Pukli, a pass leading into Kashmir, which joins the Baramuli pass at Uri. See Kashmir.

PUNCH, HIND. Five. See Panch.

PUNCHAGAH, a grain measure in the East Indies, = 24 cwt. 2 grs. 16 lbs.—*Simmond's Dict.*

PUNCHANGA, SANS., from panchan, five, and anga, the body.

PUNCHANAMA, SANS., from pancha, five, and anama, face.

PUNCHAYET, HIND. A body of arbitrators. Sir Thomas Munro affirmed that in his day the native litigant who had a good cause, always applied for a punchayet, while he who had a bad one sought the decision of a Collec-

tor or Judge, because he knew it was much easier to deceive them. In the village communities of India the punchayet is still used in India by hindoos in investigating offences against caste. The penalties are fine or expulsion; the members may be seen sitting on a mat under a tree, by the roadside or in the market-place, administering what Scripture calls justice 'in the gate;' their decision is final, and should they for instance sentence a man who had lost a cow by accident, not to be shaved by the village barber, even a Judge's order would not be sufficient to get a hair taken from his chin. The following Bengal proverbs illustrate the value set on this native jury system:—

Whatever ten persons meeting decide on whether it is successful or a failure, there is no shame.

If ten persons agree, then Bhagavan is a ghost.

Where ten persons are gathered together, God is in the midst.

If ten persons upbraid one, his life is vain.

I will go where ten go.

What ten persons say has a foundation.

The power of ten persons is equal to a lion's.

If seven or five deliberate, the work is done.

Seven thieves assembled can divide even peas.

Fully to understand the character and manners of the people, one would require to have lived and been educated among them as one of themselves. "I conscientiously believe," says Sir T. Munro, "that for the purpose of discriminating the motives of action and the chances of truth in the evidence of such a people, the entire life of the most acute and able European Judge, devoted to that single object, could not place him on a level with an intelligent hindoo punchayet, which is an admirable instrument of decision." The saying is common, Punch men Purmesur, there is a divinity in the punchayet.—*History of the Punjab, Vol. i, p. 151; Indian Statesman.*

PUNCHEE, a cloth worn by hindoos about the loins.

PUNCHERIA, see India.

PUNCHRUNGEE of Dharwar, has a warp of silk and weft of cotton, worn ordinarily by dancing women, not considered fit for respectable women, one 'than,' one rupee twelve annas.

PUNCH-SIR, an affluent of the Cabul river.

PUNCHU-CHOORA, SANS., from pancha, five, or much, and choora, a crest.

PUNCHUMEE-VRATA, SANS., from pancha, five, and vrata, the ceremonies connected with a vow.

PUNCHU-RATNA, SANS., from pancha, five, and ratna, a precious stone.

PUNCHU-RATNA TEMPLE has two or

three rooms, and a single-arched roof with a large pinnacle or turret on the dome, and a smaller one on each corner. It is dedicated to the different forms of Vishnu, or Radha-ballabha, Gopala, Madana-mohana, Govindha, &c.—*Ward's View of the Hindoos*, Vol. ii, p. 2.

PUNCHUSHARA, SANS., from pancha, five, and shara, an arrow.

PUNDARIKA, a celebrated rishi.

PUNDARU, or Bandaru, TEL. Cinchona excelsa, or Hymenodictyon excelsum.

PUNDARAM, TAM. A priest of Siva.

PUNDAY, also Pundrica, CAN. Hibiscus cannabinus.

PUNDE CYANN, TAM. A Ceylon tree which grows to about twenty inches in diameter, and twelve feet in height. It is a close-grained wood, and resembles the English pear tree. It is used by the natives for various purposes in making farming utensils.—*Edye, on the Timber of Ceylon*.

PUNDERPOOR, a considerable town on the left bank of the Kistna river where is a temple to Balaji, an incarnation of Vishnu. Punderpoor and Tripaty are Vaishnava shrines.

PUNDIT, a learned brahmin.

PUNDNA of Sutej, Glochidion velutinum, W. Ic.

PUNDRABEES, see Kunawer.

PUNDRASIN, PERS., PUSHTU. A water-melon of Candahar.

PUNDRI KACHA, or Panderi kh'ach'ha, the Almighty. See Hindoo.

PUNDUN, or Pangan, a reddish coloured wood, rather close-grained and strong, found from Raneebahal to Kasdila or about forty miles in the Sonthal jungles but not very plentiful. It is used chiefly in making carts, also for planks, doors, &c.—*Calcutta Engineers' Journal*, July 2, 1860, p. 156.

The pomegranate, a native of the mountainous countries from Syria to the north of India,

and Cabul, through Bokhara, Mezenderan and Asia Minor generally, must always have been an object of attention. It is the rimmon of the Bible, the rooman of the Arabs, and was well known to the Greeks and Romans. It is common now in almost all warm climates; the best fruits are those of Balabagh, lying under the snowy hills, near the Cabul river, and very large quantities are annually imported into the north of India from Cabul, and Cashmere. In the Himalaya and the plains, the pomegranate also occurs, but of inferior quality; the fruit is small, and is sold in the bazaar under the name of darmee; the rind, nas pal, is used in medicine and in dyeing, on account of its great astringency. The parts of this plant which were employed by the ancients, still are so in the east. Thus the flowers are the balauston of the ancients, and in India, buloositon is given as the Greek name of the double flower. They are devoid of odour, but have a bitterish and astringent taste, tinge the saliva of a reddish-colour, contain tannin, and strike a black with ferruginous salts. The rind of the fruit, especially of the wild plant, is extensively employed as an astringent and as a dye in the east. It is of a reddish-brown colour and smooth externally, but yellow on the inside; usually in irregular fragments, dry, hard, and leathery, of a very astringent taste. It contains of tannin 18.8 per cent. with 10.8 of extractive, and 17.1 of mucilage, and is used for tanning in some countries. The bark of the root was employed as an anthelmintic by Dioscorides and by Celsus, and still is so in India. It was reintroduced into practice by Drs. Buchanan and Anderson. The root itself is heavy, knotted, and of a yellow-colour; its bark is often sold in strips, sometimes with parts of the root still adhering to it. On the outside, of a greyish-yellow colour; on the inside, yellow, sometimes like that of the barberry. It has little smell; when chewed, colours the saliva yellow; has an astringent taste, without any disagreeable bitterness. It has been analyzed, but the source of its peculiar anthelmintic powers has not been discovered. It contains tannin (about 20 per cent.) gallic acid, resins, wax, fatty matters and mannite. 'An infusion yields a deep-blue precipitate with the salts of iron, a yellowish-white one with the solution of isinglass, and a greyish-yellow one with corrosive sublimate, and potash or ammonia colours it yellow.' It is apt to be adulterated with the barks both of box and of barberry. The former is white and bitter, but not astringent; the latter yellow, very bitter, and not thus affected by the above four reagents. All parts are astringent, the rind of the wild fruit especially so, and useful in diarrhoea and advanced stages of dysentery; the flowers in infusion slightly astringent; the

bark of the root astringent, but remarkably useful as an anthelmintic against tape worm. It may be given in doses of one scruple in powder; or a decoction may be formed by steeping for 12 hours fresh root-bark of pomegranate. The juice of the fruit is acidulous and sweet, and makes a pleasant sherbet for fever patients. The dried seeds, anardana, the pomegranate, with their fleshy envelopes are sold, and used in sherbets: are considered cooling. Naspal the bark of the fruit, is used in dyeing. Large quantities of fine pomegranates are annually brought from Cabul to Ajmeer. In the Dekhan there are two varieties of this tree, bearing white and red fruit—both sweet, but much inferior to the dried brought from Persia and Bussorah to the Bombay market. The tree grows easily from seed, and large fine juicy fruit, where the soil is good, is often produced. There is a variety which is generally sour, used by the natives for sherbet. By a continuation of layers from successive plants the fruit becomes almost seedless. The bark of the root is given in a decoction of 2 ounces in 2 lbs. of water, reduced by evaporation to 12 ounces. This quantity is divided into 6 doses to be taken daily, and repeated for four or five days. The rind of the fruit acts as a tonic astringent and anthelmintic, is used for tanning and powdered and boiled with milk is given as an astringent in diarrhoea.—*Royle; O'Shaughnessy, pp. 338, 339; Gen. Med. Top., p. 125; Riddell; Powell's Hand-book, Vol. i, 349.*

PUNISHMENTS. The hindoos subject themselves to more devotional austerities, penances and mortifications, some of which are of a temporary and others of a permanent character, than, perhaps any people in the world. In the performance of the tapas the prescribed acts of devotion are termed mana, or the devotion that proceeds from the heart in profound silence; vauk, or devotion audibly pronounced; neyana, or devotion accompanied by religious ceremonies, purifications, &c. Arjun, in the performance of his tapas took food, during the first month of his austerities, only once in four days.—*Cole, Myth. Hind., p. 165.*

PUNJAB, a province of British India, conquered from a Sikh ruler, a successor of Runjeet Singh. By the treaty with the sovereign of the Punjab, Runjeet Singh, dated 20th April 1809, he undertook not to make or allow any encroachment on the states on the left bank of the Sutlej. The largest of these were:

Puttiala,	Kulsiah,	Dzalgurh,
Jheend,	Maleir Kotla,	Mumdot,
Nabha,	Furreedkot,	Raikot.

In 1838, Runjeet Singh formed one of the triple alliance with the English and Shah Shoojah, but he died in 1839. In 1840, his

son and his grandson, both died by violence, to be succeeded by Sheer Singh, who was assassinated in 1843, after which great anarchy prevailed; which after years of desolation, terminated in invasion of the Company's territory, and on the 29th March 1849 the whole country was declared to be annexed. The Punjab was twice engaged in war, with the Indian Government, in 1845 and again in 1849, after which the entire Sikh dominions were incorporated with those of British India and followed by a rapid increase of its resources. The Punjab was annexed to India on the 29th March 1849 and on the 1st January 1859, it was erected into a separate Indian presidency, under a Governor. Punjab, PERS., literally the five rivers, is a name now applied to the territory on the north-west of India, watered by the rivers Sind or Indus; the Jhelum or Hydaspes; the Chenab or Ascesines; the Ravee or Hydraotes, and the Gharra or Hyphasis. It had the same name in Sanscrit from pancha, five, and ap, water. This country is in superficial area about 50,400 square miles. In its greatest breadth, it reaches from the 70th to the 75th meridian of east longitude, a distance of 293 miles, and in its greatest length, from the 34th to the 29th parallel of north latitude, a distance of 344 miles. In shape it may be likened to a vast triangle. The Punjab is remarkably well defined by geographical limits. 'On the north it has the Pir Panjal range of the vast Himalaya mountains; on the west, the Khyber and Soliman ranges, and the great river Indus, which runs almost due south to the Indian Ocean, being the western boundary of Hindustan; whilst on the south and east, it has the river Sutlej. The country is of an ovoidal form, lying between the parallels of 29° and 34° north, and the meridians of 70° and 76° east, and its area is estimated at 85,000 square miles. Five large streams, the arteries of the Indus, traverse this region, and divide it into four doabs, as the mesopotamia tracts enclosed betwixt two rivers are termed in India, and these give to it the name of Punjab or 'Country of the Five Rivers.' The modern names of these rivers, in their succession eastward from the Indus, are the Jhelum, the Chenab, the Ravi, the Beas, and the Sutlej. The Punjab has frequently been invaded from the N. W. during historic times. The Aryans in their migrations towards India, came through Afghanistan and the Punjab, ere it turned the borders of the Great Desert, and penetrated easterly in the direction of Delhi. They gradually overspread the territory of Upper India east and west between the Himalaya mountains and the Great Desert, without penetrating to the south for many centuries. They enslaved the aboriginal races as they subdued

them, compelling them to till their own lands as serfs and taking from them the whole produce except what was actually required as food for the tillers of the soil. Their emigrations into the Indus country, occurred about B. C. 4000 and the opening to the Vendidad describes the succession of the foundation of the fourteen kingdoms, the last and most southern of which was thus land of the five rivers, the Punjab. According to Chevalier Bunsen, in the same way that political tradition represents that of the western aborigines (the Hamites and Shemites) so does the Arian one in the Vendidad, represent that of the eastern tribe in the primeval land. Semiramis brought a great army into the Punjab, but was defeated and driven back; and Alexander the Great entering by the Hinduraj pass conquered it later and occupied it, and he then followed the line of the Indus to the ocean. The Greek colonists of the Punjab were placed first under Philip, while the civil administration of the country remained in the hands of the native princes, Taxiles and Porus. Afterwards, on the murder of Philip by the mercenary soldiers, Alexander (Anabasis, vi, 2; vii) directed Eudemos and Taxiles to govern the country until he should send another deputy. It is probable, however, that the Greeks continued to retain the charge; for after Alexander's death in B. C. 323, Eudemos contrived by his general Eumenes to make himself master of the country by the treacherous assassination of king Porus. (Diodorus, xix, 5). Some few years later, in B. C. 317, he marched to the assistance of Eumenes, with 3,000 infantry and 5,000 cavalry, and no less than 120 elephants. With this force he performed good service at the battle of Gabiene. But his continued absence gave the Indians an opportunity not to be neglected; and their liberty was fully asserted by the expulsion of the Greek troops and the slaughter of their chiefs,—Justin, xv, 4—"Præfactos ejus occiderat;" again "Molienti deinde bellum adversus præfactos Alexandri." Chandragupta was present when Porus was murdered, he became the leader of the national movement, which ended in his own elevation to the sovereignty of the Punjab. Justin attributes his success to the assistance of banditti; Justin, xv, 4—"Contractis latronibus Indos ad novitatem regni sollicitavit." But in this, Col. Cunningham thinks he has been misled by a very natural mistake; for the Aratta, who were the dominant people of the Eastern Punjab, are never mentioned in the Mahabharata without being called robbers. (Lassen, Pentapot Indica.) "Aratti prefecto latrones," and "Bahici latrones." The Sanscrit name is Arashtra, the "kingless," which is preserved in the Adraistæ of Arian, who places them on the Ravi. They

were the republican defenders of Sagala, or Sakala, a fact which points to their Sanscrit name of Arashtra, or "kingless." But though their power was then confined to the eastern Punjab, the people themselves had once spread over the whole country :—"Ubi fluvii illi quini *** ibisides sunt Arattorum." (Lassen, Pentapot, Iridica, from the Mahabharat.) They were known by the several names of Bahika, Jartika and Takka; of which the last would appear to have been their true appellation; for their old capital of Taxilla or Takka-sila, was known to the Greeks of Alexander; and the people themselves still exist in considerable numbers in the Punjab hills. The ancient extent of their power is proved by the present prevalence of their alphabetical characters, which, under the name of Takri, or Takni, are now used by all the hindoos of Kashmir and the northern mountains, from Simla and Sabuthu to Kabul and Bamiyan. On these grounds, Major Cunningham identifies the banditti of Justin, with the Takka, or original inhabitants of the Punjab, and assigns to them the honour of delivering their native land from the thralldom of a foreign yoke. This event occurred most probably about 316 B. C., or shortly after the march of Eudemos to the assistance of Eumenes. It was followed immediately by the conquest of Gangetic India, Justin xv, 4, and in 316 B. C., the rule of Chandragupta was acknowledged over the whole northern peninsula, from the Indus to the mouths of the Ganges. Accordingly to Col. Tod the Yavan, or Greek princes, who apparently continued to rule within the Indus, after the christian era, were either the remains of the Bactrian dynasty, or the independent kingdom of Demetrius or Apollodotus, who ruled in the Punjab, having, as their capital, Sagala, changed by Demetrius to Euthymedia. Beyer says, in his Hist. Reg. Bact., p. 84 : that according to Claudius Ptolemy there was a city within the Hydaspes yet nearer the Indus, called Sagala, also Euthymedia; but he scarcely doubts that Demetrius called it Euthymedia, from his father, after his death and that of Menander. Demetrius was deprived of his patrimony A. U. C. 562. Sagala is conjectured by Col. Tod to be the Salbhanpoora of the Yadoo when driven from Zabulistan, and that of the Yuchi or Yuti, who were fixed there from Central Asia in the fifth century, and, if so early as the second century, when Ptolemy wrote, may have originated the change to Yutimedia, the 'Central Yuti.' Numerous medals chiefly found within the probable limits of the Greek kingdom of Sagala, either belong to these princes or the Parthian kings of Minagara on the Indus. The legends are in Greek on one side, and in the Sassanian character on the reverse. The names of Apollodotus and Menan-

der have been deciphered, and the titles of 'Great King,' 'Saviour,' and other epithets adopted by the Arsacids, are perfectly legible. The devices, however, resemble the Parthian. These Greeks and Parthians must have gradually merged into the hindoo population. Recent travellers, Burnes, Masson, and Ferrier, met with tribes who claim a Grecian descent. According to Burnes, the Mir of Badakshan, the chief of Darwaz in the valley of the Oxus, and the chiefs eastward of Darwaz who occupy the provinces of Kulab, Shaughnan, and Wakhan north of the Oxus; also the hill states of Chitral, Gilgit and Iskardo, are all held by chiefs who claim a Grecian origin. According to General Ferrier, however, the whole of the princes who claim descent from Alexander are Tajiks who inhabited the country before it was overrun by Turki or Tartar tribes. The Tajik, now mahomedans, regard Alexander as a prophet. The Badakshan family are fair but present nothing in form or feature resembling the Greek. They are not unlike the modern Persian, and there is a decided contrast between them, the Turk and Uzbek.

Towards the commencement of the christian era this part of India appears to have been overrun by successive hordes of Scythians, whom some mighty revolutions in Tartary had expelled from their native seats. The Chinese historians say, that, about a century before this era, the Yuete (Gete or Jit), who occupied a vast country between China and the Teen-shan, or the Celestial mountains, were, after many sanguinary wars, expelled by the Heung-noo, or Hun, and forced into the countries of the Oxus and Jaxartes, whence they extended themselves to Afghanistan and the borders of India. The Indus was only a temporary barrier, and they appear to have occupied the whole country of the five rivers. These conclusions, heretofore formed from meagre historical evidence, are now confirmed by the discovery of coins of Punjab rulers, whose names, Azes and Azilises, have no affinity with Greek or hindoo nomenclature, and denote a barbarian origin. The great Indian sovereign, Vicramaditya, expelled the Scythian princes from the Punjab, and his era (B. C. 56) is supposed to commence from a great victory obtained by him over the barbarians in that country, which completed his conquest of all Hindustan. His empire, however, fell to pieces after his death, when new hordes of Scythians overran the Punjab, and established about 20 B. C., a dynasty of kings bearing the name of Kadphises. Coins of these kings have been recovered, and their barbarous effigies clearly distinguish them from Greeks or hindoos. This dynasty is supposed to have reigned throughout the whole of the first century of our era, when it was subverted by a fresh swarm of

Scythians, under the Kanerki kings. Between the dynasties, however, there is evidence, from the testimony of Apollonius Tyaneus, related by Philostratus that a Græco-Parthian king, named Phraotes, reigned in the Punjab, which fact is supported by coins of Undopherres and Gondophares; both called in the Arian legends upon the coins. The power of the Kanerki kings in the Punjab must have continued for some centuries, for in the topes or tumuli which have been opened in that country, Kanerki coins have been found along with these of Kadphises and other predecessors of the race, mixed with coins of the Sassanian monarchs of the third and fourth centuries of our era. That these Scythian invaders continued to pour into and occupy the Punjab, is a fact attested not only by Fa-heen, a Chinese traveller in India early in the fifth century (who crossed the five rivers, and found buddhism prevalent in that country), but by an inscription found by Colonel Tod in a temple near Kotah, in Rajpootana dated A. D. 409, which contains a memorial of a Jit prince of Salpoora at the base of the Sewalik mountains. Colonel Tod considers it to be proved beyond a doubt, "that these Jit princes of Salpoora, in the Punjab, were the leaders of that very colony of the Yuti from the Jaxartes, who, in the fifth century, as recorded by De Guignes, crossed the Indus and possessed themselves of the Punjab." Various indications appear in the Rajput annals of their conquests and settlements in this country, even as far as the Jelum.

The Sutlej or Gharra falls into the Indus, which is called also the Sind, and the Atok; into these five large rivers flow several of less importance, of which the Beas is perhaps the most full. Each of the districts of the Punjab which lies between two rivers is called a doab, from do, two, and ab, water, and of these there are five, viz.: the Jallander doab, between the Sutlej and the Beas; the Barea doab, between the Ghara and the Ravee, the Rukna doab, between the Ravee and the Chenab; the Jetch doab, between the Chenab and the Jelum; the Doab-i-Sind Sagur, between the Jelum and the Indus. Accordingly the Punjab, is arranged naturally into five parts from the five doabs or mesopotamias, and as here mentioned they are called the Jallandar, Bari, Rechna, Jetch and Sind Sagor doabs, between the several confluent of the Indus. The chief towns of the Punjab are Attok, Dera-i-Ghazi Khan; Dera-i-Ismael Khan; Jallandar; Jhelum, Kapertalla, Lahore, Leia, Multan, Peshawur. The Punjab has also districts on both sides of the river Sutlej, designated Cis Sutlej districts, east of that river and Trans-Sutlej states, west of that river. In the Cis Sutlej territory are the districts and towns of Ferozpur, Sobraon, Kithul, Loo-

diana and Umballa. The Trans-Sutlej States, are Husharpur, Dharmasala and Kangra. The sloping plain of the Punjab varies in elevation from 1,600 to 2000 feet above the sea. Lahore being but 900 and Jhelum about 1,600. It declines regularly to the south-western extremity. The soil of these doabs is of varied fertility; generally, it is very sandy, but they are rendered highly productive by irrigation from the rivers which traverse these plains. The rich and fertile tracts that border on the great rivers of the Punjab extending inland towards the centres of the "doabs," as far as the fecundating influences of their waters are felt, yield annually an abundant harvest of grains of all kinds and pulse, which form the staple articles of food to the great majority of the population. As a rule, the cultivators do not consume the wheat they produce, but keep it for sale, and subsist on the pulses, barley, and inferior grains. The plain districts of the Punjab, greatly resemble one another in their general physical features, the main difference consists in the fact that some are better irrigated than others, and that some include large tracts of sandy unproductive country, like the desert portion of Multan or Muzaffargarh. The climate of such districts is hot and sultry; the amount of rain that falls is at its minimum and cultivation is almost entirely dependent on canals and artificial irrigation. In this respect no doubt these districts differ widely from the rich plains of the Jallandar and Bari doabs, where not only do the great rivers fertilize the soil, but the periodical rainy season seldom fails to yield an abundant increase to the summer sown crops of the "kharif." The climate is in general characterized by dryness and warmth; little rain falls except in those parts extending along the base of the Himalaya and where the south-west monsoon is partially felt. The face of the country presents every variety from the most luxuriant cultivation to the most sandy deserts, and the wildest prairies of grass and brush-wood. A traveller passing through those lines of communication which traverse the Northern tracts, would imagine the Punjab to be the garden of India; on the other hand returning by the road which intersects the central tracts, he would suppose it to be a country not worth annexing. The culture manifestly depends upon two causes, the lower Himalayan range, and the rivers. From the base of the hills southward, there stretches a strip of country from 50 to 80 miles broad, watered by mountain-rivulets, and for fertility and agriculture unsurpassed in Northern India. In their downward course the rivers spread wealth and fruitfulness on either side, and their banks are enriched with alluvial deposits, and fringed with

the finest cultivation. These tracts, though unadorned with trees, and unrelieved by any picturesque features, are studded with well-peopled villages, are covered with two waving harvests in the year, and are the homes of a sturdy, industrious, and skilful peasantry. Within this tract are situated the sister capitals of Lahore and Umritsur, and most of the chief cities; such as Deenanugger, Buttala, Sealkote, Wuzeerabad, Goojceranwalla, Ramnugger and Goojrat. The climate of the Punjab varies not only with the seasons but the locality. The heat is at its greatest intensity in the month of June when the thermometer has been known at Lahore to rise as high as 112° in a tent artificially cooled. Even in the winter, that is to between December and the beginning of March, the thermometer at midday seldom falls below 70° and is often as high as 80° . The Climate for 8 months of the year is temperate, but for four months is hot and trying to the European constitution. In the Punjab, the cold increases as we rise in the hills or pass more towards the north, and, on the whole, the rain-fall is less and the aridity greater as we go further into the Himalaya, or proceed to the west either in the hills or plains. The most arid part of the plains of the Punjab is probably near and to the west of Multan, where the annual rain-fall is reckoned by fractions of an inch. "It is worthy of remark," writes Mr. Prinsep, "how singularly the results of neighbouring stations agree one with another in lines ranging from upwards of 70 inches in the Kangra valley (and even 105 at Dhurmsala,) to 10 inches on the east of the Sutlej, 5 inches at Gugaira, and say 1 inch at Multan, in the Bari doab." In the Bari doab the difference of fertility is almost entirely owing to the difference of rain-fall.

The Punjab rivers are constantly shifting their channels. The change in the Beas is the most striking, as that river has altogether lost its independent course, and is now a mere tributary of the Sutlej. But the fluctuations of the other rivers have been very remarkable. Thus the valley of the Chenab below Kalowal is nearly 30 miles broad, and that of the Ravi, near Gugera, is 20 miles, the extreme limits of both rivers being marked by well-defined high banks, on which are situated many of the most ancient cities of the Punjab. Multan was originally situated on two islands in the Ravi, but the river has long ago deserted its old channel, the nearest point of which is now more than 30 miles distant. But during high floods the waters of the Ravi still flow down their old bed, and General Cunningham had twice seen the ditches of Multan filled by the natural overflow of the river. Multan consists of a walled city and a strong fortress situated on

opposite banks of an old bed of the Ravi, which once flowed between them as well as around them. But Mr. Powell mentions that some rivers are much more liable to be flooded to excess than others. The Markanda, in the Amballa district, at one time of the year is like an ocean; at another it will be a slender stream, hardly to be called a river. The Indus always contains a large body of water, but even this river is liable to become dammed up in the hills, whence it rises: the water then accumulates and bursting at length these dams, comes down with terrible force; once or twice these floods have occurred, giving only a few moments notice by a sound as of distant thunder, and then coming on with a sweep that spreads desolation for many miles. The risings of the Ravi, Chenab, and other rivers, is familiar to every one who has travelled in the Punjab, at some season the traveller has to cross a river on a bridge of boats not a hundred yards long, while at others, he has scarcely been rowed across the same river in six hours, the water having risen and extended to the size of a small ocean. This rise will frequently take place in the course of a couple of days, sometimes in a few hours.

The plains of the Punjab may be described as vast expanses of alluvial clay and loam, whose elementary constituents must once have been the same as now form the rocks of the huge ranges of mountains to the north. The principal constituents that produce a variety in the nature of soils, and one which is very important in the Punjab island, in fact the main distinction of soils (apart, from that of their containing or not containing "kalr," the efflorescent salt,) is that the soil is sandy, as in many portions of districts it is or that it is rich loam and clay.

The Punjab contains 32 districts in 10 divisions. The feudatory states are estimated to contain five millions of people and an area of 197,339 square miles. The 32 non-feudatory districts have a population of 17,611,498 covering an area of 101,829 square miles, or 173 to the mile. Of the people 9,403,810 are agriculturists and 8,190,127 are not directly connected with the land. Leaving out Delhi and Hissar it may be said roughly that the population has increased, in thirteen years, nearly two millions, and in density 21 to the mile. The density of population is very slightly less than that of France. It is higher than the average of all non-feudatory India, which is 159, and falls below that of the North-West, Bengal and Madras alone. In the division of Jullundhur, with its good rain-fall, there are 596 to the mile, omitting hilly Kangra. In the well-watered division of Umritsur the proportion stands at 513, in Umballa at 412, in

Delhi at 342 and in Lahore at 210. In the Derajat frontier it falls to 77 and in desert Multan to 73. The country between the Beas and the Sutlej, the home of the Sikhs is thus the most populous. The rate of population follows the rainfall, and the number of mouths waits on the facilities for cultivation, which re-act on each other. There are 59 millions of acres in the Punjab. Delhi has now supplanted Umritsur as the most populous city. The total population of the Punjab in 1868 was found to be 17,593,946 souls. But hitherto the population has in most official reports been roughly estimated at 15 millions. During the last 12 years there has been a very considerable increase, but in order to admit of a fair comparison, the population of the Delhi and Hissar divisions should be omitted, as these formed part of the North-western Provinces previous to the mutiny. These two divisions contain a population of 3,148,858 leaving 14,445,088 for the rest of the Punjab. At the census of 1852 the same portion of the Punjab was estimated to contain about 2½ millions. Some of the increase, however, is apparent only, owing to the more accurate enumeration effected during the recent census. The number of dwellings of all kinds was 4,021,769, giving an average population of 4 $\frac{3}{8}$ per house. Of the total population 9,563,565 are males and 8,030,381 are females. They are divided into three classes—adults, including all persons over 18 years of age; youths and young women including all from 12 to 18, and children including all under 12 years. The results under these heads are as follows:—

Adults, Males	5,351,006	Females	4,583,524
12 to 18, „	866,683	„	608,823
Under 12, „	3,345,876	„	2,838,034

The males both in the total and in each class considerably exceed the females. This would now seem to be the law of at least the tropical portions of Asia. Passing over the European and Eurasians, the number of native christians is stated at 2,949, which is probably not far from the truth. The rest of the population is thus classified. The Punjab census was first taken in 1865 and again in 1868. Area 17,611,498 miles or 65 million of acres, only 2·2 per cent. can read. The population of the feudatory states was estimated at 4,982,521. The other population is 17,611,498. The home of the Sikhs is the country between the Beas and Sutlej and is the most populous and Umritsur and Ferzepore are the two Sikh centres. The Sikhs in 1868, were in number 1,144,300.

In the Census of all British India, in 1872, the Punjab was found to have 19 millions the following are the general results as accepted by the Government of India for financial purposes:—

Bengal (Lieutenant Governor).....	
Madras (Governor, Council and in-Chief).....	31,330,000
North-western Provinces (Lieutenant Governor).....	20,775,000
Punjab (Lieutenant Governor).....	13,000,000
Bombay and Sindh (Governor, Council and Commander-in-Chief).....	14,000,000
Oudh (Chief Commissioner).....	13,000,000
Central Provinces (Chief Commissioner).....	9,250,000
British Burma (Chief Commissioner).....	2,000,000
Ajmeer (Commissioner under Governor General).....	332,000
Coorg (under Chief Commissioner of Mysore).....	170,000

Paying Revenue to the Viceroy	186,143,669
Mysore	5,000,000
Benar	2,250,000
The 153 Feudatories	45,000,000
Paying Revenue to native Nobles	55,250,000
	241,593,669

In the Punjab, the Jat all take the designation of Sing'h, and dress somewhat differently from the ordinary hindu Jat; but for the most part, they only become formally Sikhs, when they take service and that change makes little difference in their laws and social relations. The Jat of Delhi, Bhurtpur, &c., are a very fine race and bear the old hindoo names of Mull and such like and are not all Sing'hs. In Rajputanah, the Jat are quiet and submissive cultivators. They have now long been subject to an alien rule and are probably a good deal intermixed by contact with the Meena and others. When the struggles of the Sikhs for dominion closed with the demoralization of a powerful army, large bodies of men, who had till then coerced their own government, betook themselves to useful pursuits with manly forbearance, turning their swords into ploughshares and prosecuting commerce, trade and agriculture with surprising energy. Trained from their infancy to the use of arms, and capable of the most heroic fortitude, and most chivalrous devotion, the Punjabees have yet that feeling of respect for law, and entertain that wholesome dread of crime, which have been productive of the best social results. If it be believed that organized offences were rarely known in the Punjab, even in days of Sikh laxity, well elaborated statistics have since established such to be the case more than the most sanguine could hope, and experience has verified the general correctness of the statistics. The Punjabee is active and industrious by nature, the physical accidents of his country allow him but small room for choice as to the means of livelihood. The Punjab is by no means as productive as the well watered plains of Bengal, and to secure a remunerative return from its ungrateful soil necessitates consistent and well sustained application. When there is a dearth of employment in his own country, the Punjabee does not, as a rule, encumber his poor community by taxing its charity, his restless spirit of enterprise drives him out of his home in search of employment, and if he lives to return from the land of his sojourn, his

friends not seldom profit by his venture. With fewer prejudices, fewer elements of passive hindrance, little or no respect for obstructive traditional practices, the Punjabee is not averse to those salutary measures of reform of which his unfettered good sense seems to have an intuitive perception. Hence, he, of all the races subject to Britain, is best able to appreciate western opinions, and hence, he of all the subject races, has not only confidence in British honesty of purpose, but in the wisdom and justice of government measures. It is hardly possible for men whose experience extends only to the older provinces, to believe either in the existence of this powerful moral auxiliary, or in the extent to which it has been rendered instrumental in accelerating the progress and securing the success of government measures. Let it be recorded to the credit of the poor but honest Punjabee, that he has placed the British government under great obligation in return for the many that have been conferred on him. Even in British troubles, this willingness on the part of the people to co-operate with them was neither weak nor dormant; long before the Punjabee had experienced the beneficial effects of British policy, his fidelity, so far as passive resistance to extraneous treachery may be so called, drew forth British acknowledgments. When a band of mountaineers attempted to stir up an outbreak in the Sind Saugor doab, so far back as 1851, their failure to draw supporters demonstrated the important fact, that the submission first imposed by force of arms had ceased to be a badge of bondage, and that the rights and responsibilities of citizenship were not likely to be long misunderstood. During the rebellion of 1857 the Punjabees stood foremost among the subject allies; the zeal they evinced in the destruction of the enemies of government cannot in fairness be wholly ascribed to the love of plunder which, in certain cases, undoubtedly proved a valuable incentive. When streams of ill escorted convoys incessantly poured from the Punjab into the seats of war, the government gratefully testified that not a waggon was plundered, nor a beast of burden stolen, nor a rupee of treasure lost. Even in the worst days of our trial government revenue was paid punctually throughout the Punjab, and wherever the emergency warranted a demand in advance the money was forthcoming without a word of protest.

The N. W. frontier of British India is formed by the N. W. border of the Punjab. Omitting the Kashmir territory, this border commences at the top of the Kaghan valley adjoining the Chilas district: it skirts the range of the Black Mountain which separates Kaghan from the

Indus and then reaching that river follows its left bank to Torbella, where, crossing over, it runs along the base of the hills, encircling the Peshawar valley as far as the Khyber pass. From this point it is reflected back towards the Indus, and passing round the Afreedi hills to Kohat; thence proceeds westwards up the Miranjaye valley along the base of the Orukzye and Zymookht hills to the river Kurran. Here it again turns back and passing round the Waziri hills, strikes the Takht-i-Suliman range, in the Dehra Ismael Khan district, onwards from this it skirts the base of the Suliman range running due south, and joins the Sind frontier at Kasoor, presenting a border frontage of about 700 miles. The mountains are traversed by many passes leading from the Cabul highlands to the Indus valley, and are inhabited by a number of different tribes, of whom those located on the western side are subjects of the Cabul government, whilst those in the eastern slopes where the valleys mostly open directly, on to the Indus valley, and all drain into it, are, as regards government taxes and allegiance, thoroughly independent. The whole population of the Punjab, both high and low is above the average Arian type. The Punjabi is tall, handsome, high-featured and long-bearded.

The independent Affghan tribes dwelling along the outer face of the north-west Punjab frontier and inhabiting hills are as under.

Adjoining the frontier of Huzara District, Hoodsunzyes.

Adjoining frontier of Peshawar District, Judoons, Bunoorwalls, Swatees, Ranezyes, Osmankheyles, Upper Momunds.

Adjoining frontier of Peshawar and Kohat Districts, Afreedees.

Adjoining frontier of Kohat District, Buzotees, Sepah, Orukzye, Zymoosht Affghans, Toorees.

Adjoining frontier of Kohat and Dehra Ismael Khan Districts, Wuzerees.

Adjoining frontier of Dehra Ismael Khan District, Sheoranees, Oshteranees, Kusraanees, Bozdars.

Adjoining frontier of Dehra Ghazee Khan District, Khutrans, Kosahs, Lughtrees, Goorchanees, Murrees, Boogtrees.

The British Affghan tribes within the frontier, and British subjects, inhabiting partly hills and partly plains are:

Huzara District, Kurnoulees, Gukar, Doons and Suttees, Kaghan Syuds and other tribes of Huzara.

Peshawar District, Eusufzyes, Khulees, Momunds of the Plains.

Peshawar and Kohat Districts, Khuttuks.

Kohat District, Bungushes.

Dehra Ismael Khan District, Bunnoochees, Murwutees, Butanees, Chiefs of Tank, Chiefs of Kolachee, Chiefs of Dehra Ismael Khan, Nootkanees, Loonds.

Dehra Ghazee Khan District, Dreshuks, Muzarees.

The N. W. Punjab frontier since 1849, has been a scene of frequent warfare. The Punjab and Affghan frontier for 600 or 700 miles is conterminous, and the mountain

tribes along the frontier are independent alike of the Cabul and the British. In 1852-3, Colonel Mackeson, commanded in a campaign at the Black mountain. In 1853, Lt. Genl. Sir Sydney Cotton's campaign was against the Panjtar and Sitanah. In 1860, Sir Neville Chamberlain commanded against the Waziri, and in 1863, Sir N. Chamberlain and another led in the Umbeyla campaign. In 1868, a field force proceeded against the Hazaras under Br. Genl. A. T. Wilde, C.B., C.S.I., with two Brigadiers, Colonels Bright and Vaughan to punish them for a wanton aggression on the people of Agror. The independent tribes can muster between 80,000 and 100,000 fighting men, viz.

Hassanzye and Swati or Kohistani on the Mahaban or Black Mountain.....	2,000
Otmanzye and Amazye on the eastern slopes.....	2,500
Gaddun, on the South-eastern slopes.....	2,500
Yusufzye and Chagharzye.....	6,000
Sitana.....	1,200
Swat.....	18,000
Momund.....	10,000
Afridi.....	20,000
Orukzye.....	18,000
Zyemookht.....	8,000
Waziri.....	20,000
Shirani.....	5,000
Ashtarani.....	1,000

In the time of Baber, the rhinoceros was hunted on the plains of Attock, and wild animals are still very numerous. The plains of upper India, in which as Colonel Cunningham remarks, (Hist. Sikhs, p. 4) the Brahmin and Khshutree races had developed a peculiar civilization, have, however, been overrun by Persian or Scythic tribes, from the age of Darius and Alexander to that of Baber and Nadir Shah, and the long antecedent emigration of hordes of the Jut from the plains of upper Asia, and the prominent religious changes introduced by them have been alterations in the nature-worship and polytheist religions of the earlier occupants, the subsequent introduction of the mahomedan creed.

Rice is the chief product of the Lahore district. Kyes, loongee, daryai and other silk manufactures, are exported chiefly to Delhi, Umritsur and Peshawar; and kundla and gold lace work are made largely for local consumption, and for export to Mooltan, Rawulpindee and Peshawar. Umritsur town being the commercial capital of the Punjab proper, its trade affords a better index of the resources of the province than those of the district to which it gives its name. This trade is carried on with Bokhara, Cabul, Cashmere, Calcutta, Bombay, Sind, Rajputanah, the North-Western Provinces, and all the principal marts

in the Punjab. Manufactures are largely carried on in the city. The most important are those of pushmina and silk goods, both of which give employment to large numbers of workmen. The pushmina goods are manufactured from the fine wool of Thibet, imported through Cashmere, and 4,000 looms are engaged in this trade, each of which is worked by two men. The workmen are all Cashmere mussalmans, and the manufacture is said to have been established since A. D. 1840. It declined during 1866 but is understood to be since reviving. The most valuable articles are the Cashmere shawls. The silk manufacture has long been established at Lahore, and has spread from that place to Umritsur, where it is now carried on to about an equal extent. The greater part of the raw silk is brought from Bokhara, but some is also received by way of Calcutta.

The Lower Punjab and Bhawalpur districts yield respectively 750 and 150 tons of indigo. In the time of Runjeet Singh, the Punjab revenues were estimated at £3,250,000, of which, in 1844, the customs and excise duties amounted to £240,000. The annual value of the trade, including that of Cashmere, is estimated at five hundred thousand pounds, which represents a total of some five millions sterling from the period when British rule commenced in the Punjab. It appears that sheep's wool, however fine, will never assume that permanent brilliancy of colour which is the peculiar characteristic of the Cashmere and Umritsur shawls, and that until the shawl has been washed and exposed to the sun for some time, it is impossible to ascertain whether or not sheep's wool has been used. It also appears that many of the native manufacturers have grown rich by thus adulterating the article, and that those who are poor hope to become rich also by the same means. All of them know that the fraud is punishable, but all defy remonstrance. Unless the practice can be checked, a meeting of the merchants was of opinion that the trade would be lost to the Punjab, and that it would once more be monopolised by the maharajah of Cashmere who, "adopts the most stringent and effectual means of repressing any attempt at, and punishing, frauds." The remedy suggested was that the City Punch or Trade Committee should be empowered to call on those engaged in the manufacture to sign an agreement on contract not to adulterate, under a penalty, which should be recovered in the Small Cause Court in the event of adulteration being proved. That the goods should be in the custody of the police till the case was decided. That on a first "conviction" the goods should be stamped to show that they were adulterated, and on a second that they should be impounded and destroyed.

This plan was successfully tried some years ago with good effect, but the manufacturers discovered it was not sanctioned by authority, and "returned to their mal-practices." On the south-west of the Punjab we have Beloochistan, a tract of country extending from the sea to the mountains north of Quetta, inhabited by migratory and pastoral tribes, with few products and manufactures of their own, but not inconsiderable importers of the silks and cotton fabrics of India. Proceeding north, we come to Afghanistan, a mountainous region lying between 30° and 36° north latitude, and 60° to 68° east longitude, with a population estimated at 4,200,000, abounding in fruits, vegetables, and wools, but more important as containing within its limits three great entrepôts of trade between Persia, Turkistan, and the south,—Herat, Cabul, and Kandahar,—where the silk of Bokhara and Khotan, the shawl-wool of Kirman, on the south-west, and Khokand on the north-east; the assafœtida and madder dye of Afghanistan, are exchanged for the cotton and cloth fabrics of Europe and the indigo and the spices of the east. Passing the well-watered plains of Murghab and the petty Uzbek states to the north-west of the Bamian hills and the Kunduz districts, in whose eastern frontier are the ruby mines of Badakshan, and the lapis-lazuli quarries of the valley of the Kokcha, we come to the plains of the Oxus and Jaxartes, into which Russia has now passed, but formerly divided politically into the three Uzbek states of Khiva, Bokhara and Khokand. Of these, Khiva has a population estimated at 2,500,000; Bokhara, one of 2,000,000, but Bokhara is at once the most productive, and its capital (the ancient Torbakwa), a city of from 60,000 to 150,000 inhabitants, is the great depôt for the trade of Central Asia, occupying the position held in more ancient times by Balkh and Samarkand. Its silk is used throughout the north-west of India; its cotton is exported largely to the north, and the black lambakin-wool of Karakul, one of its provinces, is a staple article of trade; while it imports considerable quantities of tea, fur-skins, iron, and cotton goods. The caravans leave yearly for Russia via Orenberg and other frontier towns, and the trade with that country is estimated at upwards of £300,000 per annum; it has also a considerable trade with western China via Yarkund, with Persia via Mashed, and with India via Cabul and Peshawur passes. It is distant from the Russian frontier 65 days' journey, over rugged and inhospitable tracts, but the route to the Punjab via Cabul and Peshawur takes only from 40 to 45 days, and lies through countries comparatively fertile, the chief physical difficulty being the

crossing of the Hindoo Koosh. Hence the products and manufactures of Europe ought, and do, to a great extent, already find a readier access to the Central Asian mart from the frontiers of India than from the frontiers of Russia. Leaving to the north Kopal, on the southern Russian frontier, we proceed eastward to the borders of Chinese Turkistan, including the provinces of Yarkund, Kashgar and Khotan; the former the entrepôt of trade between China and Bokhara, and the latter celebrated from the time of Ktesias, for its mineral products, its jade and emeralds, its shawl-wool and flax, a considerable importer of furs, broadcloth, leather, and sugar, and at one time the entrepôt of a vast trade with Hindoostan. Turning south we come to the kingdom of Kashmir, including its outlying province of Ladak, a feudatory of the British Government and the British provinces of Spiti and Kulu. The staple products and manufactures of Kashmir, are well known, but it is not so well known that, notwithstanding an exorbitant tariff, Kashmir imports yearly not less than £184,000 worth of the produce and manufactures of India and Europe. Between the British provinces and Ladak and the countries beyond, a trade exists chiefly in shawl-wool and charas (a resinous exudation of the hemp plant, used as a narcotic), which are taken in exchange for opium, the produce of the Kulu hills, otter-skins, cotton piece goods, spices and drugs; but the trade is not so flourishing as it once was, or as it might be. The principal channels through which the Punjab commerce ebbs and flows, between those countries and the Punjab, are as under:

The natural channels of trade between Afghanistan, Persia, Western Turkistan, and India are the passes of the Sulimani range and those leading to Peshawur; these are as follows: First.—The Mulla pass near Gandava, in the Khelati hills, level throughout, safe, and one that may be traversed in all seasons. Second.—The Bolan pass, leading through Shikarpur to Sakkur on the Indus, through which the trade of Afghanistan passes from Kandahar into Sind, a distance of 400 miles. This road is generally level, and the trade through it is valued at £50,000 per annum. Thirdly.—The Ghulwaira or Guleri pass, opposite Dera Ismael Khan. This, though somewhat unsafe, is the chief trade-route between Afghanistan and the Punjab; the trade through it is estimated at £294,000 per annum, and is in the hands of hereditary clans of merchants called Povindahs. Fourthly.—The Tatara and Abkhana, passes leading from Cabul to Peshawur; these are practicable all the year, and are at present tolerably secure, and the trade through them, which is on the increase, is valued at £277,150 per annum.

Through these passes lies the route from Bokhara, which is distant 829 miles or from 40 to 45 days' journey, by the Hajigak pass of the Bamian range, the route usually preferred, and somewhat less by the passes of the Hindoo Koosh.

It may be interesting to remark that the bulk of the trade flowing from India through the Peshawur passes is said to come via Delhi and Umritsur, and not more than one-fifth part via Karachi and the Indus.

The natural, or, at any rate the most direct channel of trade for the countries of Eastern Turkistan, including Kashgar, Yarkand and Khotan, would be through the territories of the maharaja of Jammu and Kashmir, via Leh and Srinuggur to Umritsur;—a distance in all of 1,100 miles if the route to Leh by the valley of the Shayak river and the Karakorum pass is taken, and 983 miles by the more difficult over the Sasor and Kilian passes. But owing to the insecurity of the road between Yarkand and Leh and the heavy imposts upon goods passing through the Kashmir territory, the trade for the most part passes into India via Bokhara and Cabul; and of the trade which comes by Leh a considerable portion is brought by a more circuitous and difficult road through Kulu and Mandi, supply to avoid the exaction of the Kashmir custom-house.

The trade between Eastern Turkistan and India by the Leh route is estimated at £23,504.

Lastly, between Kashmir and the Punjab several practicable routes exist, the most frequented being that by Jammu and Banihal. The trade with Kashmir and Jammu is estimated at £384,850.

The great portion of the commerce flowing through these channels to and from the Punjab concentrates itself at Umritsur, whose trade now exceeds one million sterling per annum in value.

We have thus seen that a considerable trade with the countries of Central Asia does exist, and that there is a considerable demand for European and Indian goods; also taking Yarkand, Bokhara, and Herat, as the commercial foci of Central Asian trade, British India is practically nearer those markets than Russia.

The difficulties to contend with are great, arising partly from the social and political state of the nations through which the trade passes, and the physical difficulties of the countries which it has to traverse. The nations are for the most part in a semi-civilized state, on the border land, as it were of nomad and settled life bigoted adherents of the mahomedan religion, and inaccessible to European influence; and, as for physical difficulties, every skein of Bokhara silk in the market of Umritsur has to traverse a distance of upwards of one thousand miles,

over unbridged rivers, and seven mountain passes—one of them 11,700 feet above the level of the sea; every English calico exposed in the bazaar at Yarkand has to perform a journey of least 525 miles from the Punjab, over passes of 11,300, 12,570, 13,446 feet in height to Leh, and thence over still loftier mountains and through an inhospitable route infested by robbers for 575 miles more.

But, on the other hand, to combat these difficulties we find in existence an indomitable mercantile energy; an energy which, albeit, in oriental fashion, crystalised, as it were, and made hereditary in certain tribes,—as the Babi of South Affghanistan, the Povindah of the Goleri pass, the Paracha of Turkistan, the Kiryakash of Yarkand,—is almost unsurpassed. Year after year their caravans stream into the Punjab, from Mashed, Cabul, Bokhara, Yarkand, bringing tales of perils overcome. Year after year the native ballads bewail the hardships of the travelling merchant, but they still stream on. It remains to be seen how far the British can assist these adventurous traders.

With regard to the trade with Yarkand and Eastern Turkistan, it would appear that, that it has been retarded and turned away from the direct route through which it formerly flowed, mainly from two causes,—the insecurity of the road between Yarkand and Leh, and the exorbitant dues levied by our feudatory the maharaja of Jammu and Kashmir on the goods passing through his territory. The following were the rates of duty levied on certain goods exported from the Punjab to Kashmir by the Jammu and Banihal road.

Cloth, Cotton, Woollen.—Percentage of duty.

	R.	A.	P.
Long Cloth, Dimity, Jean, &c.	30	3	0
Muslin, flowered piece goods,			
dress pieces	8	7	4
Cambric, Linen, (Khasa, &c.)	15	12	0
Colored Muslins, &c.	10	8	0
Chintz, Scarlet, Cotton, Velvet	13	6	10
Bundree Chintz	38	0	0
Broad Cloth	29	11	0
Sugar candy	85	0	0
Sugar	128	14	0
Molasses	150	0	0
Coarse sugar	100	0	0
Tea	78	0	0
Kiriana-Spices, drugs, dyes, &c., from	Rs. 19 to 200		
Metals—Iron	90	0	0
Pewter	104	0	0
Copper	21	0	0
Tin	54	0	0

On the Ladak Frontire.

Metals—Iron	91	0	0
Molasses	137	0	
Sugar	24	0	0
Goat-skins	16	0	
Sugar candy	17	0	0

The roads from Simla and Kulu in the direction of Chini on the east, towards China; and from Kulu to China on the north via Ladak to Yarkand, are being improved and made passable for laden beasts of burden. A bridge is being thrown over the Chandrabhaga at Kokkur,

at present the main impediment to travellers, another over the Sutlej at Wangtu.

Alum forms a very important product and article of commerce at Kalabagh, whence it is exported to all parts of the Punjab, and is taken also to Hindustan.

Amongst others in the Punjab the woods used as fuel are,

Aisne, sp.
Artemisia sacrorum.
Calligonum polygonoides.
Caragana pygmaea.
Crotophora tinctoria.
Ephedra gerardiana.
Eurotia ceratoides.

Hippophae rhamnoides.
Juniperus communis.
Juniperus excelsus.
Periploca aphylla.
Rhazya stricta.
Rosa webbiana.
Tanacetum tomentosum.

Near the Punjab railway lines, Phulai (*Acacia modesta*) furnishes a hard wood which is perhaps the best fuel given by any wild tree. It is only found in quantity near Umritsur and Jullundur. Dhak or palasa (*Butea frondosa*) has a wood too soft and light to furnish, unmixed, a really effective fuel. Jhand or kandi (*Prosopis spicigera*) covers very large areas in the central tract near Lahore, and grows more partially over many parts to the south. Its wood is open-grained and softish, and is very subject to the attacks of white ants, but it furnishes a fair fuel, and has hitherto been perhaps the chief source of supply for the locomotive in the Punjab. Next to it, as to quantity of fuel furnished, come the tamarisks, furas, lei, plich, &c., (*Tamarix orientalis* and *Tamarix indica*) which from some miles south of Lahore southwards, cover hundreds of square miles of the low land.

The mineral springs of the Punjab are always situated either in the hills or in submontane districts; there are hot springs, saline and sulphurous waters. Petrifying streams, in limestone districts, are not uncommon. The Jawala mukhi range is a portion of the outer parallel of the sub-Himalaya. It is composed of a sandstone of the later tertiary period. The springs are situated all within a distance of about 30 miles near the base of the hills, on their south-westerly face, looking towards the Beas; all contain chloride of sodium or common salt and iodine, stated by Mr. Marcadieu, to be in the form of iodide of potassium in considerable quantity. In proceeding by order of their respective positions, and taking for a starting point the limits of the Jawala mukhi valley, naturally formed by an elbow of the Beas near Nadaun, the salt indurated springs are placed in the following order; 1st, Kooperah; 2nd, Jawala; (two springs); 3rd, Jowala mukhi; 4th, Nageah, and 5th, Kanga bassa. All the water from the five springs, one at Kooperah, three at Jawala, one at Nageah and one at Kanga bassa, after having undergone slight concentration by being exposed only for a few hours to the open air, is pur-

chased by the Bunniahs at one anna per seer, or exchanged for the same value in attah, &c. The livelihood of the natives living in the vicinity of these springs is chiefly earned by this trade. They are convinced and tell all who question them that the water contains an efficacious principle which promotes the cure of the goitre. Nature offers this remedy ready formed, and in large proportions without the excess being injurious; and there is a chance of finding a sufficient quantity of salt to render it profitable in a commercial point of view. While the Jawala mukhi waters contain a large percentage of iodine, Dr. Fleming states as the result of his analysis that not a trace of it can be found in the rock salt of Mandi. The sulphuretted hydrogen spring at Danear, is considered sacred by the natives, who resort to it for cure in goitre and other diseases; it is situated about a quarter of a mile off the main road to Danera. The spring is not a thermal one, but its exact temperature has not been observed. A small way-side spring in the hills, near Dalhousie, has a strong chalybeate taste, and deposited the reddish precipitate indicative of iron. The temperature of Bishasht spring is 102° Fahr., that of the principal spring at Manikarn 202° Fahr. In the time of Baber, the rhinoceros was hunted on the plains of Attock. Wild animals are still very numerous. During the year 1859 the number of people killed or injured by wild beasts in the Punjab, were as under:—

Killed 474, viz.,	Men.... 6	Injured 119, viz.,	Men....33
	Women. 1		Women... 3
	Children.467		Children..83

The following number of wild beasts were destroyed during the year 1859.

Tigers 9.	Males..... 6	Bears 187.	Males.....110
	Cubs..... 3		Females.. 40
			Cubs..... 37
	Hyaenas 2.		
Leopards 202,	Males....109	Wolves 1,174,	Males....337
	Females.. 36		Females..308
	Cubs..... 57		Cubs.....529

The amount of rewards paid for the destruction of these animals, 1,567 in number, was Rs. 5,724. The total number of animals destroyed during the year 1859, was nearly double that of 1858, but the loss of life was much greater. The casualties were chiefly in the five districts of Umballa, Umritsur, Goordaspoor, Sealkote, and Goojranwalla, and the last four especially, among children. In Goordaspoor (144), and in Sealkote (160), the number of children's deaths exceed the total number of casualties in the rest of the Punjab. Wolves are the most destructive, and nearly four times as many children were killed in the Umritsur district, as wolves. Gold-washing is carried on in certain streams in the Rawul Pindee, Hazara, and Attock districts.

Gold is found in minute scales in the sand-

stone of the Salt range, in a lower range of hills running parallel to the Himalayan chain, between the rivers Indus and Jhelum, and it is also found in small quantities in the sands of the Indus, Jhelum, Beas and Sutlej; but the occupation of gold-washing is not very remunerative, amounting on an average to not more than from 3d. to 6d. a day, and the proceeds of the annual lease of gold-washing amounted for one year only to £84. Gold dust is also imported from Ellache, in Kohistan. In Attock, the washing appears to be most successful along the low sandy border of the Chuch valley, where the Indus may be supposed to lose much of its rapidity after issuing from the Hazara hills. The gold in this locality is confined entirely to the alluvial deposits along the river bank, and seems to have been brought down from the mountains north of Hazara. Gold was much more plentiful in these washings after the great floods of 1841 and 1858, as, doubtless, the deposits in the upper bed of the Indus being disturbed by the unusual violence of the stream, it was brought down in considerable quantities. That gold exists in the hills to the north of Hazara, there can be little doubt; the people of the Chuch plain say, "that to the north of Khagan and the Black mountain, lies a country, the people of which are so simple, that they are unacquainted with the worth of the precious metals, although gold is everywhere found among the stones of that country, the inhabitants set no value upon it." Some people from Hazara, or Punjitar, paid a visit to this country and were able to obtain large quantities of gold, but at the cost of their clothing of which the inhabitants robbed them, although they made no opposition to their taking gold.

Mir Alum Khan, Lumberdar of Mouzah Goorgushti in Chuch, valley one of the lessees of the gold contract, stated that there are gold washings along the banks of the Indus, especially at Jellalia, Moomundpoor, Yaseen, Asghur, and Haroon. After the flood of 1841, for two years, the quantity found was considerable, also after the flood of 1858. The instruments used are a "Droon" or long cradle, and a bowl, and a kirni (digger) made of iron. To each "Droon" eight men are required. The master gets a double share. Gold is bought by the proprietor from the diggers at rupees 12 per tola. The lease in 1860, was rupees 40 per month, whereas in 1859, it was rupees 150 per month.

In Shahpoor, the gold-washing is carried on in most of the larger nullahs in the Chuckralla Ilaka, but that the occupation is not a very profitable one, is proved by the small number of "Droons," or cradles at work, the total average number of which on the various streams

in this district is 30, and these pay to government a tax of 2 to 3 rupees per annum for each cradle. The sands of the "Imppio" afford a fair yield of gold in the neighbourhood of Lawa, but lower down the same stream, none is to be found.

In Peshawur, in the north Indus (above Attock) and the Cabul rivers, auriferous deposits are found, although not extensively, some of the boatmen in the cold weather work as gold-washers in gangs of from 5 to 7, and collect on an average 2 to 2½ tolas each in the season, the gold sells at Peshawur at rupees 15 per tola, this would yield them about two annas per diem while actually employed. A mine has lately been discovered near Candahar, but its value has not yet been fully tested by the Ameer. The gold-washings of these rivers might be advantageously examined by those who possess the necessary qualifications.

Pure Panjabi, is confined to the small number of Sikhs who are settled in the different cities and towns. The generally known tongues are, the Beluchi, the Jataki, the Persian, the Sindhi.—*Campbell*, p. 77; *Powell's Handbook*; *Econ. Prod. PUN-JAY-REE, HIND. A candle given to lying-in-women.—*Herkl.*

PUNJ BAI HILLS, see Kandahar.

PUNJEE of Dharwar, is a cloth used by well-to-do people, to dry themselves after bathing, and also worn as a waist cloth by poor people. Price one rupee.

PUNJEH-MIRIAM, ARAB. *Cyclamen europæum*, W.

PUNJI or Panji, TAM. *Gossypium*, cotton.

PUNJIR, see Kohistan.

PUNJI VERA, TAM. Cotton seeds.

PUNJNUD, signifying like Punjab, the 'five rivers,' the united stream flowing into the Indus.—*History of the Punjab*, Vol i, p. 8.

PUNJUM, an unbleached, strong, fine cotton long-cloth made in India.—*Simmond's Dict.*

PUNJ-PAI, or Paiyeh, PERS. Crab.

PUNJPAO, see Khyber.

PUNJ-TAN, the five holy persons, viz., Mohummed, Allee, Fatima, Hussun, and Hosein.

PUNKABAREE. A thousand feet above Punkabaree in the outer Himalaya, the prevalent timber is gigantic, and scaled by climbing Leguminosæ, as the *Bauhinia* and *Robinia* which sometimes sheath the trunks or span the forest with huge cables joining tree to tree. Their trunks are also clothed with parasitical orchids, and still more beautifully there with *Pothos* (*Scindapsus*), *Peppers*, *Gnetum*, *Vines*, *Convolvulus*, and *Bignoniæ*. The beauty of the drapery of the *Pothos* leaves is pre-eminent, whether for the graceful folds the foliage assumes, or for the liveliness of its colour. From one steppe, the ascent to Punkabaree is sudden and steep, and accompanied with a change in soil and vegetation. The mica slate and clay slate protrude everywhere, the former full of garnets. A giant forest replaces the stunted and bushy timber of the Terai proper; of which the *Duabanga* and species of *Terminalia* form the prevailing trees, with *Cedrela* and the *Gordonia wallichii*. Smaller timber and shrubs are innumerable, a succulent character pervades the bushes and herbs, occasioned by the prevalence of *Urticacæ*. Large bamboos rather crest the hills than court the deeper shade, and of the latter there is abundance, for the torrents cut a straight, deep, and steep course down the hill flanks: the gulleys they traverse are choked with vegetation and bridged by fallen trees, whose trunks are richly clothed with *Dendrobium Pierardi* and other epiphytical orchids, with pendulous *Lycopodia* and many ferns, *Hoya*, *Scitamineæ*, and similar types of the hottest and dampest climates. The forest is truly magnificent along the steep

mountain sides. The proportion of deciduous trees is considerable partly, probably, due to the abundance of the *Dillenia*, *Cassia*, and other *Sterculia*, whose copious fruit was all the more conspicuous from the leafless condition of the plant. The white or lilac blossoms of the convolvulus like *Thunbergia*, and *Acanthaceæ* were the predominant features of the shrubby vegetation, and very handsome. All around, the hills rise steeply five or six thousand feet, clothed in a dense deep green dripping forest. Torrents rush down the slopes, their position indicated by the dipping of the forest into their beds, or the occasional cloud of spray rising above some more boisterous part of their course.—*Hooker's Him. Jour.*, Vol. i, pp. 103, 108, 281.

PUNKAH, a hand, or swinging fan, used in India. Hand-punkahs are frequently richly ornamented with gold and silver, beetle's wings, peacock's feathers, &c., a fan carried by fugeers.—*Simmond's Dict.*

PUNKEER, or peacock and horse modelled yachts and pleasure boats on the Ganges.—*Tr. of Hind.*, Vol. i, p. 81.

PUNKHO, a weight for the precious metals used in Bengal = 0.14036 grain troy.—*Simmond's Dict.*

PUN MULLIKA, MALEAL. *Jasminum sambac*, Ait.

PUNNA, HIND. Emerald, Corundum.

PUNNA, HIND. *Ehretia serrata*.

PUNNAGA, or Punnagamu, TEL. *Calophyllum inophyllum*, L.—*R.* ii, 606, also *Rottlera tinctoria*, *R.* iii, 827; *Corr.* ii, 168. Br. 627 inserts this word on the authority of W. 542, but in S. K. it is given as a syn. of *Calophyllum inophyllum* or Ponna in Br., who seems altogether to have mistaken the true meaning.

PUNNAKU KIRE, TAM. *Melochia corchorifolia*.

PUNNARKANI • KIRE, TAM. *Illicium sesile*.

PUNNAM, SANS. Full moon.

PUNNAM, MALEAL. *Bassia latifolia*.

PUNNE, TAM.? *Civet*.

PUNNEER MARAM, TAM. *Guettarda speciosa*, Linn.

PUNNEKALI, TAM. *Mucuna prurita*, cowage.

PUNNE PODALANG-KAI, TAM. *Momordica charantia*.

PUNNI, an Affghan clan. See Kaker.

PUNNUS, DUX. Fruit of *Artocarpus integrifolia*.

PUNNUGASHUNA, SANS., from pannaga, a serpent, and asha, to eat.

PUNNY, HIND.? A bamboo measure.—*Simmond's Dict.*

PUNSIRY, a weight for grain in the Nizam's territory, India, of 5 seers, or 9 lbs. 14 oz. 12 drs.—*Simmond's Dict.*

PUN-SEED OIL, Eng. *Calophyllum inophyllum*.

PUN-SPARS, ANGLO-MALAY. See *Calophyllum dillenia pentagyna*, Pun, Poon.

PUNSUI, a Ganges boat. See Boat, Dengi.

PUNT, MALAY. *Rubia cordifolia*, Linn.

PUNT'HEE, SANS., from put'hu, a way.

PUNTVYAR, MALAY. Madder.

PUNUL, the sacred thread worn by the brahmins and some other castes.

PUNYABHADRA, see Inscriptions.

PUNYAHAVACHANAM, see Hindoo.

PUN-YET, BURM., see Resins.

PUNYU, MALAY. The tortoise.

PUOAM, TAM., a tree of Malabar, of a light-red colour (*Schlechteria*) much like the Spanish mahogany. It is generally curved in its growth, and is considered very durable. It grows to about twenty-four inches in diameter, and seldom more than twenty feet high. It produces a fruit which the natives pickle, and from which also they extract an oil, which they use for rheumatic gout, bruises, and various complaints: it is considered by them to be valuable. The weight of this wood is about thirty-seven and a half pounds the cubic foot.—*Edye, M. & C.*

PUOAM PARASOM, TAM., a tree with which the natives of Malabar are well acquainted, and which they use for the masts and yards of pattamahs. It grows to about sixty feet high, and fifteen inches in diameter: it may be considered inferior to the mast peon before described.—*Edye, M. & C.*

PUPA, a genus of mollusc.

PUPA. In Entomology this term is applied to the third stage of existence of an insect, the egg being the first stage, and the larva or caterpillar, the second.—*Eng. Cyc.*

PU-PADRIA MARAM, TAM. *Bignonia chelonoides*, Linn.

PUPAKH, a Kazilbashi hat.

PUPALIA ORBICULATA. One of the sand binding plants.

PUPINA, a genus of molluscs.

PUPPI CHUCKAY. The bark of the Puppi root yields an orange dye, and is treated with alum, myrobolans, &c. This dye was exhibited from Bellary, Mysore and Salem, at the Madras Exhibition of 1855. It was noticed by Buchanan (Mysore 1, p. 168,) and was named by him somewhat doubtfully as *Ventilago*? a Rhamnaceous genus. Flowering or fruit bearing specimens of this scendent shrub have not been procured to settle the point in question. This dye stuff is in very common use in India, and deserves a fair trial in Europe. The puppi is seldom used alone, but generally as an adjunct with chay root, to produce a rich chocolate colour, or, if with galls, a black.—*M. E. J. R.*

PUPNAS, a river in Bhopal.

PUPRA, HIND. ? A tree of Chota-Nagpore, hard, white timber.—*Cat. Ex. 1862.*

PUPPALI PALLAM, TAM. *Carica papaya*.

PUPPANTI MIRUTKUNDA, TEL. *Acalypha indica*, Linn, Roeb., Wight.

PUPPAYA, DUK. *Carica papaya*.

PUPRI or **Papri**, DUK., HIND. Carbonate of soda.

PUPUNHA TREE, *Guilielma speciosa*, Mart., is the Piritu or Pirijao of Venezuela, the Pupunha of the Amazon district, and the Paripou of Guiana. It is a palm, of an intensely hard wood, sharp needle like spines are thickly disposed in rings or bands, round its slender cylindrical trunk. The Indians subsist for months on its farinaceous fruit.—*Seeman.*

PUR or **Par**, GUZ., HIND. Feathers.

PUR, TEL. *Eriodendron anfractuosum*, DC.

PUR also **Puri**, SANS. A city, a town, written Pore and Poor.

PURALASA, see Hindoo.

PURAM-HUNGRU. Hindu religious mendicants, who go naked, observe perpetual silence, and appear regardless of all visible objects.—*Cole, Myth. Hind., p. 932.*

PURAMOOI, BENG. *Nelsonia tomentosa*.

PURAN DUKHT. See Sassanian kings.

PURANA, literally, old, sacred, the poetical books of the hindoos. Every Purana treats of five subjects: 1, the creation of the universe; 2, its progress, and the renovation of worlds; 3, the genealogy of gods and heroes; 4, chronology according to a fabulous system; and 5, heroic history, containing the achievements of demi-gods and heroes. Since each Purana contains a cosmogony, with mythological and heroic history, the works which bear that title may not unaptly be compared to the Grecian theogonies. This description is applicable to the eighteen mythological poems called Puranas, not to certain passages of each Veda, bearing the same name of Purana, and interspersed throughout that portion of the Vedas entitled Brahmana, or divine precepts. India, according to the Purana, was anciently divided into ten divisions, viz., five in the territory now styled Hindustan, Saraswati, Tirhut, Canouj, Gour or Bengal, and Guzerat, and five in what is now called the Dekhan, viz., Maharashtra, Orissa, lingana, Dravada and Carnata. In these divisions ten languages were spoken. It is related in the Scanda Purana, that, when the whole earth was covered with water and Vishnu lay asleep on the bosom of Devi, a lotus arose from his navel, and its ascending flower soon reached the surface of the flood; that Brahma sprang from the flower, and looking around without seeing any creature on the boundless expanse, he imagined himself the first born. Vishnu, otherwise called, in this character,

Narayana, with his toe in his mouth, reposes on a floating lotus leaf, this seems puerile, and, indeed, what popular exhibition of such subjects doth not; and may perhaps mean to represent a circle. The toe in the mouth, like the tail of a snake in its mouth, in mythological language, is interpreted Endless: applied to Time, Eternity: to a being, Eternal.

It is, however, in the Bhagavata or eighteenth of the Puranas or old books, in which Krishna is described in his complete apotheosis and in that he is represented as the eighth avatar of Krishna. The first Indian poet after Vedic times was Valmiki, author of the Ramayana, a complete epic poem, on one continued, interesting, and heroic action, and the next in celebrity, if it be not superior to it in reputation for holiness, is the Mahabharata of Vyasa. To Valmiki are ascribed the books subsequent to the Vedas the sacred Puranas, which are called, the eighteen, and which have the following titles:—1 Brahm, or the great one; 2 Pedma, or the Lotus; 3 Brahmanda, or the Mundane egg; 4 Agni or Fire—(these four relate to the creation); 5 Vishnu or the Preserver; 6 Garuda or his Eagle; 7 the transformation of Brahma; 8 Siva; 9 Linga; 10 Nareda, son of Brahma; 11 Scanda, son of Siva; 12 Marcandeya or the immortal man; 13 Bhawishya, or the prediction of futurity—(these nine belong to the attributes and powers of the deity); 14 Matsya; 15 Varaha; 16 Kurma; 17 Vamana, or as many incarnations of the Great One in his character of Preserver, all containing ancient traditions, embellished by poetry or disguised in fable. The eighteenth is the Bhagavata, or life of Krishna, with which the same poet is by some imagined to have crowned the whole series; though others, with more reason, assign them different composers. And they are differently arranged and named by other authorities.

The word Purana occurs in the Vedas; but what Puranas or parts of them existed then it is difficult to determine. As they were evidently written to counteract the influence of buddhism and work on the popular mind, it is, not at all unlikely that some of them were composed at an early date. Their composition is, however, supposed to have commenced in the 7th century A. D. Both Colebrooke and Wilson ascribe the authorship of the Srimat Bhagavata to Bopdeva in the 13th century A. D. after the appearance of the Vishnu Purana. The native tradition is strongly against this hypothesis. Babu Rajendralal Mitra, a distinguished oriental scholar, in noticing the Mukta-phala says, "this work and another lately found by me in which the same author gives an abstract of the contents of the Bhagavata, afford strong presumptive evidence against the opinion

now generally received by oriental scholars, that the Bhagavata was written by Bopdeva. A much stronger proof, however, is afforded by the Danasagara of Ballala Sena, king of Bengal, in which the Bhagavata is repeatedly quoted. That work also quoted from the Adi Purana, which Wilson supposed was composed within the last three centuries. Bopdeva, according to Colebrooke and Wilson, flourished in the 12th and 13th centuries; Ballala lived in the 11th. There is mention of the Puranas and even of the Bharata or Mahabharata in the Sutras of Asvalayana; but we doubt much whether the existing Mahabharata in its integrity is the work referred to. Neither the Ramayana nor the titles of any of the other Puranas are alluded to in the Vedas. But there are still grounds for thinking that the Ramayana was anterior to the Mahabharata.

Some of the Puranas are voluminous compositions. It has been said that they were the work of the same Vyasa by whom the Vedas were arranged and they are held in almost equal estimation. According to a definition furnished by many of them, a Purana should treat of five topics—primary creation, secondary creation, the families of the patriarchs, the reigns of the Manus, and the dynasties of kings. The actual Puranas conform in no one instance to this definition: the authors are often declared to be others than Vyasa, and they offer many internal proofs that they are the work of various hands, and of different dates, none of which are of very high antiquity. The oldest of them may not be anterior to the eight or ninth century, and the most recent to be not above three or four centuries old. In the present state of hindoo belief the Puranas exercise a very general influence. Some of them, or portions of them are publicly read and expounded by brahmans to all classes of people. Most brahmans who pretend to scholarship are acquainted with two or more of them, and particular sections, as the Devi Mahatmya are amongst the most popular works in the Sanscrit languages. Prayers from them have been copiously introduced into all the breviaries; observances of feasts and fasts are regulated by them; temples and towns, and mountains, and rivers, to which pilgrimages are made, owe their sanctity to legends for which the Puranas or the Mahatmyas, works asserted, often untruly, to be sections of them, are the only authorities, and texts quoted from them have validity in civil as well as religious law. The determination of their unauthenticated composition deprives them of the sacred character which they have usurped, destroys their credit, impairs their influence, and strikes away the main prop, on which, at present, the great mass of hindoo idolatry and super-

stitution relies. That the Puranas represent in many instances an older, and probably a primitive scheme of hinduism, is no doubt true; they have preserved many ancient legends they have handed down all that the hindoos have of traditional history, and they furnish authoritative views of the essential institutions of the hindoos, both in their social and religious organization. But in their decided sectarial character, in their uncompromising advocacy of the pre-eminence of some one deity, or of some one of his manifestations, in the boldness with which they assert his pantheistic presence, in the importance they attach to particular observances, as fasting on the 8th, 11th, and 14th days of each half month, in the holiness with which they invest particular localities, in the tone and spirit of their prayers and hymns, and in the numerous and almost always frivolous, and insipid, and immoral legends, which they have grafted upon the more fanciful, dignified, and significant inventions of antiquity; they betray most glaringly the purposes for which they were composed, the dissemination of new articles of faith, the currency of new

There seems good reason to believe that the Puranas in their present form accompanied or succeeded a period of considerable religious ferment in India, and were designed to uphold and extend the doctrines of rival sects, which then disputed the exclusive direction of the faith of the hindoos. It began perhaps in the third or fourth century of our era, having for its object the extermination of the buddhists, who in consequence were driven out of India to Siam, Java, China and Tibet. When the buddhists, whom all parties considered heterodox were expelled, their enemies began to quarrel amongst themselves, and in the eight or ninth century a reformer named Sankara Acharya is celebrated for having refuted and suppressed a variety of unorthodox professors, and established the preferential worship of Siva. He instituted in support of his doctrines, an order of mendicants which still subsists, and he is in an especial manner regarded as the founder of a system of belief adhered to by brahmans of learning, particularly in the south of India. The triumph that he obtained for the deity he patronized did not long survive him. Early in the eleventh century, Ramanuja a follower of Vishnu, undertook to depose Siva and set up his own divinity, not only in the belief of the people, but in the more substantial benefits of temples and endowments. Tradition records, that the great temple of Triveni, one of the largest and richest in the peninsula, now dedicated to Vishnu, was arrested from the rival votaries of Siva by Ramanuja and his followers. The ascendancy of the Vaishnavas was not un-

disputed in the south, and a new sect of Saivas, the Lingayites, sprang up in opposition to them: the contest was carried on with popular violence, and in one of the disturbances that ensued, the raja of Kalyanpur was killed and his capital destroyed. The mahomedan invasion of the south crushed both the contending parties, and the predominance of the same power in upper India prevented the like violence of collision. The Vaishnavas there spread with little resistance under the followers of Ramanand, a disciple of Ramanuja, to whom or to whose pupils, the greater proportion of the mendicant orders in Hindustan owe their origin, and under two brahmanical families, one in the west sprung from a teacher named Vallabha, who established themselves as hereditary priests of the juvenile Krishna, and one in Bengal and Orissa descended from Nityanand and Adwaitanand, two disciples of Chaitanya, a teacher, with whom the popularity of the worship of Jagannath originated. A particular description of all the different divisions of the popular religion of the hindoos may be found in the sixteenth and seventeenth volumes of the Asiatic Researches.

These different orders and families are now almost exclusively the spiritual directors of the people. Some of them are rich and of brahmanical descent; some are poor and composed of persons of all castes. They are almost all, whether rich or poor, illiterate and profligate. Such literature as they occasionally cultivate, and it is one of the means by which they act upon the people, is vernacular literature, compositions in the spoken languages. These are mostly songs and hymns addressed to Vishnu, Krishna or Radha, tales and legends of individuals celebrated amongst them as saints, always marvellous, mostly absurd, and not unfrequently immoral, and vague and dogmatical expositions of elements of belief, which although in some degree discoverable in the Puranas, have assumed in novel and portentous prominence in the doctrines of the Vaishnava teachers and the practices of the people. These elements are passionate devotion and all-sufficient faith.

According to the geography of the Puranas, the earth consists of a series of central circle and six other annular continents, separated from each other by as many oceans of different fluid substances.

The Puranas do not afford any reliable information as to the state of the early occupants of India. The account which these books contain of the periods, dynasties, races, genealogies and kings of Vedic India, looks imposing, minute, and circumstantial. They describe two great dynasties of the sun and moon, branching off into separate kingdoms. Four

great ages of the world, with an accurately defined lists of kings for each, and these lists all so framed as in appearance to strengthen and support each other. Containing also the very names found in the Vedas, with an elaborate system of dynastic change, and of intermarriages. But the hindoo of the middle ages, had an immoderate speculativeness, a love of wild extravagance, fiction and untruth. Colebrooke tells us (Vol. ii, p. 100,) that the Raghava-Pandivegam, an extraordinary poem by Cavaraj, king of poets, is composed with studied ambiguity, so that it may at the option of the reader be interpreted as relating to the history of Rama, and other descendants of Dasaratha, or that of Yudisthira and other sons of Pandu. It tells in short, two distinct stories in the same words, as the following sentence will show.

Succeeding in youth to the kingdom of his variously valiant father, who departed for heaven, he dwelt happily in the city of Ayodya, which was adorned with elephants and upheld the prosperity of his realm.

Writers with such perverted imaginations issued the yogas and genealogies of the Puranas, the little leaven of truth in some of them, being the names of a few Vedic kings, interspersed apparently at hap-hazard. The writer of the Vishnu Purana, in such a simple matter as writing out a list of rivers, puts down all he can remember, some twice over, and then adds to it to the names of about a dozen rishis, taken bodily from the Vedas. The Puranas have not only adding nothing to our stock of knowledge as to the state of ancient India, but have done much to retard research. For partly from the skill and elaborateness of the fiction and partly from the mutual support, which the Puranic writers gave each other, astronomy, poetry, legend, chronology and history all helping on the deceit, modern scholars received the dynasties and the historical eras of two or perhaps three of the Yogas, as having some reality. But the Rig-Veda does not contain many of the Puranic names nor even an allusion to them. It makes no mention of Solar or Lunar races. It knows nothing, and indeed can know nothing of Ayodhya, and Kusi, and Mithila, and Vesali and Magadha, or even of Indraprestha, while the Puranas on the other hand know nothing of dynasties in the Punjab, or on the Indus.

The best known is the Vishnu Purana, which is referred to the 11th century, by Pro-

fessor Wilson. The Puranas have been thought by some, to represent Egypt as the theatre of action, and the wars related of Brahma, Siva and Vishnu, to be the legend of the wars between Osiris, Horus and Typhon; for Brahma, in his character of all destroying time, corresponds with Typhon; Mahadeva or Siva, that of the productive principle, with Horus or Hara; who assumes each of his characters on various occasions either to restore the powers or to subdue the opponents of Vishnu, or active nature, from whom his auxiliary springs.—*Wilson's Hind. Theat.*, Vol. ii, p. 58; *Wilson's Religious practices and opinions of the Hindoos*, p. 24; *Calcutta Review*, No. 109, p. 52; *As. Res.*, Vol. iii, p. 375; *Coleman*; *Moor*, p. 441; *Colebrooke's As. Res.*, Vol. vii, p. 202. See Inscriptions, Tantras, Vidya, Yama or Dharmarajah.

PURANADIISTHANA, the old capital of Kashmir, the present Pandrethan, possessed a tooth of Buddha.

PURANAI, one of Ayenar's wives.

PURANI, PUNJAB. Paini santa.

PURASHA, TAM. *Thespesia populneus*. Purasham-yennai, TAM. Oil of *Thespesia populnea*. See Dyes.

PURBI, HIND. A variety of tobacco.

PURBIA, SANS. A term applied to the natives of the eastern countries of India, or those lying in the east of the Ganges, beginning from Behar. At the commencement of the revolt of 1857, the Purbia of Oude and Hindustan in general, constituted three-fourths of the regular army of Bengal, and all of them, from community of country, although of different races, castes, and religions, had so strongly united together that the army had become quite a close service, open only to the few favoured classes. The strength of this feeling only became known when the Government tried and failed to introduce two hundred Sikhs into each regiment of the line. Purbeah, literally means a man from the east of the Ganges, from Oude and Bahar, from which districts the mass of the troops of the Bengal army, before the mutiny of 1857, were drawn.

PURBUTTEE, see Bazeegur, Nats, Khas.

PURCHO, BACHA, HIND. Echinops nivia.

PURDAH, a curtain a cotton cloth, with white and blue stripes used for curtains, &c. The word purdah, which means curtain or veil, is often metaphorically used, and implies that seclusion in which many females in India live, but in cases where ladies transact business, the expression must be taken literally, as they are seated behind a curtain, where they hear and are heard, and through the openings of which they see without being seen.—*Malcolm's Central India*, Vol. i, p. 279.

PURDEY'S ISLETS. They are small

low islands, covered with the trees; and the Bat, which appears as two islands, has shoal-water and reefs round it.—*Keppel's Ind. Arch.*, Vol. ii, p. 201.

PURREE NAHOWN, HIND., the fairy bath.

PURRUD, HIND., borrowed cloths.

PURRENBAY, HIND., *Prosopis spicigera*.

PUREE, a beautiful yellow Chinese pigment, in the composition of which the urine of the elephant is said to be a chief ingredient. It is brought to China in round lumps of various sizes in colour like orpiment, with a strong urinous smell, and little or no taste.—*Morrison*.

PURGING CROTON, ENG. Croton tiglium.

PURGING OIL. Oil of Curcas purgans.

PURGIR-CASSIE, GER. Cathartocarpus fistula.

PURGING CASSIA, ENG. Cathartocarpus fistula.

PURHIN, HIND. Mullet fish.

PURIGADDI, TEL. Cyperus bulbosus, Linn.

PURI, a town in Orissa, famed for its temples, to Kishna, Balram, and Kali, known in Europe as Jagarnath. The idols are of wood, painted white, black and yellow, and are exposed twice a year.

PURI, HIND., a kind of sweetmeat.

PURI, TEL. Paddy. Unripened rice.

PURI DAMPA, TEL. Stalk, and Puri Gadda, TEL., root of Cyperus bulbosus, Vahl, Linn.

PURIHARA, one of the four Agnicula tribes. The Purihara, or Pritihara, is scattered over Rajasthan, but do not seem to have any independent chieftainship there. At the confluence of the Cohari, the Sind, and the Chumbul, there is a colony of this race, which has given its name to a commune of twenty-four villages, besides hamlets, situated amidst the rivines of these streams. Mundawur (classically Mundodri) was the capital of the Purihara and was the chief city of Marwar which owned the sway of this tribe prior to the invasion and settlement of the Rahtore clan. The Purihara is the least of the Agnikula. They never acted a conspicuous part in the history of Rajasthan.—*Tod*, i, p. 106. See Agni, Agnicula, Khutri, Rajputs.

PURIK, see Maryul or Lowland, Ladak, India, Sheep, Tibet.

PURING, HIND. Jasminum officinale, shal-purni, HIND. is Desmodium tiliaefolium.

PURINSJI, MALEAL. Sapindus laurifolius, Vahl.

PURITHI, MAL. Ananas sativus.

PURITY, mahomedans follow the Jews in their attention to outward purity. Before praying, it is necessary that one be undefiled. There are degrees of defilement, the least of

which requires that the hands, arms and feet be washed before praying and for this purpose motques are always provided with cisterns or tanks of water: in the desert sand is used. After greater impurities it is necessary that the whole body be washed, hence the longer they remain undefiled the purer their life; Wuzzu, expresses the ablution and Hedas, the state of defilement, during the continuance of which they cannot pray. The Mulana Abu Ashah was said to use the water of purification twice in a month—that is, his life was so pure that for a whole fortnight he was not so much defiled as to make necessary a total ablution. Vir præcipue emissionem seminis facit at mulier menstruum. Amongst the brahmins sipping water is a part of the ceremony of purification. In the Mitakshara, on the subject of personal purification, the direction is 'let the twice-born man (after evacuations) always perform the upasparsa; i. e., says the commentator, 'let him sip water.' According to Prof. Wilson the sense of the passage in Book vii, 4, is "that Nala sat down to evening prayer (as Manu directs 'he who repeats it sitting at evening twilight, &c.,) after performing his purifications and sipping water, but without having washed his feet; such ablution being necessary, not because they had been soiled, but because such an act is also part of the rite of purification."

A hindoo becomes unclean by various circumstances, during which he is interdicted almost every religious ceremony, and forbidden to shave or cut his nails. In the act of purification the person shaves his head, bathes, and puts on clean apparel. A hindoo becomes unclean after the death of persons related to him by birth. If a child die before he has teeth, the family bathe immediately, and become clean; or if a child die before its ears are bored, the family remain unclean one night. If a woman miscarry, the family become impure ten days. After a birth, all the members of the family in a direct line become unclean. A woman in her periods is unclean for three days; but on the fifth day, after bathing, she may again perform religious ceremonies. Every person is considered as in some measure unclean while in a state of sickness, and from some religious services a sick person is wholly excluded. A brahman becomes unclean by the touch of a sudra, a dog, a mahomedan, a barbarian, &c., and all castes, by touching a woman in her courses, a dead body, ordure, urine, the food of castes, &c.—*Ward's view of the Hindoos*, Vol. ii, p. 147; *Journ. Ind. Arch.*, Vol. v, No. 11; *Williams' Story of Nala*, p. 130.

PURIVRITTEE, SANS., from puree, prep. and vrittee, existence.

PURJLU, HIND. Oreosera lanuginosa.

PURLU. A substance used in dyeing black with "pasuta," (alum and sulphate of iron) as the mordant.—*Powell's Hand-book*, Vol. i, p. 453.

PURMATA, MALAY. A jewel.

PURNA, a tributary of the Taptee.

PURNA PALA, see Inscriptions.

PURNA, SANS. Chavica seriboo, *Mig.*

PURNEAH, a district and station town in Bengal, the town 283 miles from Calcutta.

PURPARUL. A close grained wood from the Sonthal jungles, esteemed equal to box, for which it was supposed it would prove an excellent substitute.—*Mudras Spectator*, 29th Nov. 1858.

PURPLE DENDROBIUM. *Dendrobium secundum.*

PURPLE FLEABANE. *Vernonia anthelmintica.*

PURPLE FLOWERED CORONILLA, *Eng* *Coronilla picta.*

PURPLE FLOWERED THORN APPLE, *Datura fastuosa.*

PURPLE YAM, see Lal Guranyo alu.

PURPLE MOUNTAIN EBONY, *Eng* *Bauhinia purpurea*, *Linn.*

PURSA MARAM, TAM. *Thespesia populnea*, *Lam.*

PURSLANE. *Portulaca sasiya.* | *Portulaca oleracea.*

Choolce, *HIND.*

Round stem, fleshy leaves, and slightly acid. It is used as an ingredient in salads. It is reared by seeds sown at the commencement of the rains, and will thrive in any soil. Leaves of a succulent nature harmless, tasteless, and inodorous, many varieties are cultivated on the plains for their pretty flowers, raised from seed. Purslane is as common a weed in the Tenasserim provinces as it is in America, and is used by the natives for a pot-herb.—*Riddell; Jaffrey; Mason.*

PURSUNG KAI MARAM, TAM. *Thespesia populnea*, *Lam.*

PURTALLAH, HIND., a leather belt.

PURTREE, a river near Landhoura in Seharunpur.

PURU, or Paurava. In the time of Alexander there were two princely races belonged to the Puru or Paurava, both called Porus by the Greeks. When the Arians had advanced further and large portions of what is now termed India were under their sway, we read of one monarch with many names—Divodasa, Atithigwa, Aswateha, Prastoka, Srinjaga and Puru. Three of these are found in one verse (Vol. 2, p. 34): "For Puru, the giver of offerings, for the mighty Divodasa, through Indra, has destroyed ninety cities. For Atithigwa the fierce (Indra), hurled Sambara from off the mountain, bestowing (upon the prince) immense treasure."

Divodasa was a warrior and a conqueror; he is described as overcoming and destroying many cities of Sambara, reserving one for his own use. He made a successful expedition as far as Parnaya (Quere the modern Purniya?) In his old age at the head of a confederacy of twenty kings, Kusta and Ayu being the chief, he lead an army of 60,000 against the mighty and youthful Sa-sravas, is defeated and compelled to submit. And a writer in the Calcutta Review (No. 64, p. 432), views this war to be the historical foundation for the traditional great war of the Mahabharata. The age of Divodasa is estimated to have been about the time of Cyrus, and the engagement described to have been with some Satrap (Kshatrap), left by Cyrus, when he was occupied with his great Median, Lydian or Babylonian campaigns. It may, however, have been during the rebellions and troubles of the early days of Darius Hystaspes. And by a curious coincidence, Bentley places Garga (the bard of Divodasa) in 548 B. C., and the cautious Professor Wilson suspects an allusion to the budhists, which could not be earlier than 545 B. C.—*Bunsen*, Vol. iv, p. 556. See Porus.

PURU, this kingdom according to Bunsen was established B. C. 3000 by the Aryan emigrants, who afterwards made conquests of Matmaru, Tansu and Iliva.

PURU, son of Yayati, the ancestor of the Kaurava and Pandava. See Hindoo; Pandu dynasty.

PURUK, see Ladak.

PURUM, HIND., of Dharwar narrow strips, sewn together, and used as curtains for the front of shops and houses, and also as tents to protect goods on transit. This is made of the waste warp-ends of pieces of cotton cloth joined together.—*W. C. Anderson of Dharwar.*

PURUM, another description used more for making bags, &c.

PURUMANANDA, SANS., from parama, excellent, and anunda, joy.

PURUMARTHU, SANS., from parama, excellent, and aritha, an object.

PURUMATMA. The hindooes do not decompose themselves at the names of God, or Ullah, because they consider these expressions synonymous with Purumeshwur—the Supreme Being, that is to say, the Purumatma, or Supreme Spirit of the Vedantee, the Siva of the Saivite, the Vishnu of the Vaishnavite. This exalted being, they consider, does not interfere immediately in the affairs of men—

no question of scripture is necessarily brought forward by the introduction of his name. But when the names of Jesus Christ, of Mohammed are employed, the case is different; the hindoos understand these to refer to some man who appeared on this earth, whom Mlech believe to be of similar nature with Ram or Krishn, and the belief in whom is necessarily inconsistent with the belief in their own scriptures.—*Ras Mala Hindoo Annals*, Vol. ii, p. 441.

PURUM-ESHWARA, SANS., from param, excellent, and eeshwara, God, or more simply, the glorious.

PURUM-HANGSHA, SANS., from param, excellent, and angsha, a goose.

PURUNDHUR, a hill fort now resorted to as a sanitarium, is 4,300 feet high, 16 miles from Poona. An account of it is given in Blacker's History of the Mahratta War.

PURUPU KIRE, TAM. *Portulaca oleracea*, Linn.

PURPUT, also Papra, HIND. *Oldenlandia biflora*.

PURURAVAS, is always called a Rajarshi (Raja Rishi or royal saint.) In the classification of sages, there are three orders: the Rajarishi, or kingly sage, such as Janaka; the Brahmarshi or brahman sage, as Vasishtha; and the Devarishi or divine sage, as Narada.—*Hind. Theat.*, p. 201; *The Hero and the Nymph*.

PURUSHOTTAMA, one of the names of Vishnu. A name of Krishna as Vishnu. According to the Harivansa, Rukmini was the daughter of Bhisnmaka, king of Kundina, and was solicited in marriage by Krishna, of whom she was enamoured; but the son of Bhisnmaka, Rukmi, jealous of Krishna's fame, and being incensed by the death of Kansu, his friend, was hostile to the match, and negotiated his sister's marriage with Sisupala king of Chedi, likewise inimically disposed towards Krishna. All the kings of India were invited to the wedding, and amongst them came Krishna, who seeing Rukmini proceed to offer her devotions at a temple, waylaid her on her return, and with the assistance of his brother Balarama and his kinsmen carried her off to Dwaraka. A hot pursuit followed, and an engagement took place in which Rukmi was struck to the ground by Kesava, but his life was spared at his sister's intercession, and Krishna remained possessed of

his prize. The marriage was solemnized at Dwaraka, and Rukmini remained the chief of Krishna's wives. He had ten sons by her, of whom Pradyumna is the most celebrated. The rape of Rukmini is also narrated nearly in the same words, as in the Harivansa, in the 5th Section of the Vishnu Purana, and more in detail in the tenth book of the Bhagavat, and in the Krishna Janma Khanda of the Brahma-vaivertta Purana.—*Hind. Theat.*, Vol. ii, p. 82.

PUSH'N, a Rind tribe. The great Rind tribes are sub-divided into 44 branches, and though not Brahui are denominated Baluch. Their traditions affirm them to have immigrated ages ago, from Damascus and Aleppo. Their language is the Jetki in common with that of the other inhabitants of Kach gandava and Mar-i-Rind means a brave man. The Rind of Kach gandava are of the Utan-zye divisions.

The Utan-Zye dwell at Suran.

„ Dumbki and Jakrani, dwell at Lehri.

„ Dodà Marri dwell at Kahan.

„ Bugti in the hills east of Lehrat, Sing Saloh and Teriki.

„ Homarari dwell at Tambu.

„ Jamali „ Rojan.

Of these Rind tribes, the Dumbki, Jakrani, Bugti and Doda Marri, have always been distinguished by their rebellious and predatory habits. They indulged these in attacks on the British armies west of the Indus. The Marri tribe is considerable and inhabit the eastern hills of Kach Gandava, and a peaceful and obedient portion of the tribe are in the hills west of the province below Jell. A large portion are at Adam Marri, on the S. E. frontier of Sind. The Marri of Kach Gandava are notorious for their lawless habits and make frequent inroads on the plains. They and the Maghazzi seem to have emigrated from Mekran to Kutch gandava, at different periods and to have become incorporated with the Jut cultivators. The following minor Rind tribes reside in the north eastern hills of Saharawan.

Kallui at Lup.
Kuchik at Kirta.
Pushh at Johan.

Mandarari at Robdar.
Pugh at Kajuri.

On the western banks of the Indus are two great Rind tribes, the Gurchani, who inhabit Harand and south of these the predatory, but nearly independent, Mazari tribe. The Maghazzi have only four families, the Butani at Jell, being the chief. They are the deadly enemies of the Rind, but are probably of the same race. The Maghazzi are sub-divided into four principal families or clans, of which the Butani of Jell are the most illustrious and give the chief or sirdar, to the whole. They boast of being able to muster 2,000 fighting men, and between them and the Rind a blood feud long existed. The Maghazzi and Rind are alike addicted to the use of ardent spirits, opium and bhang.

PUSHI, see Kocch.

PUSHINI KAIA, TAM., also Pushni kiray, TAM. Cucurbita maxima, *Duch.*, W. & A.

PUSHKALAVATI, or Peukelaotis, Pukkhaloti, Pukkala, stupa of the 'eyes-gift.' Pushkalavati, or Peukelaotis, according to General Cunningham, the ancient capital of Ghandara was Pushkalavati, which is said to have been founded by Pushkara, the son of Bharata, and the nephew of Rama. Its antiquity is undoubted, as it was the capital of the province at the time of Alexander's expedition. The Greek name of Peukelaotis, or Peucolaitis, was immediately derived from Pukkalaoti, which is the Pali, or spoken form of the Sanskrit Pushkalavati. It is also called Penkela by Arrian, and the people are named Penkalei by Dionysius Periegetes, which are both close transcripts of the Pali Pukkala. The form of Proklais, which is found in Arrian's 'Periplus of the Erythraean Sea,' and also in Ptolemy's 'Geography,' is perhaps only an attempt to give the Hindi name of Pokhar instead

of the Sanscrit Pushkara. According to Arrian, Peukelas was a very large and populous city, seated not far from the river Indus. It was the capital of a chief named Astes, perhaps Hasti, who was killed in the defence of one of his strongholds, after a siege of thirty days, by Hephæstion. Upon the death of Astes the city of Peukelaotis was delivered up to Alexander on his march towards the Indus. Its position is vaguely described by Strabo and Arrian as near the Indus." But the geographer Ptolemy is more exact, as he fixes it on the eastern bank of the river of Suastene, that is, the Panjkora or Swat river, which is the very locality indicated by Hwen Thsang. The river here mentioned is the Kophes, or river of Cabul; and the bearing and distance from Peshawur point to the two large towns of Parang and Charsada, which form part of the well known Hashtnagar, or "Eight Cities," that are seated close together on the eastern bank of the lower Swat river. These towns are Tangi, Shirpao, Umrzai, Turangzai, Usmanzai, Rajur, Charsada, and Parang. They extend over a distance of fifteen miles; but the last two are seated close together in a bend of the river, and might originally have been portions of one large town. The fort of Hisar stands on a mound above the ruins of the old town of Hashtnagar, which General Court places on an island, nearly opposite Rajur. "All the suburbs," he says, "are scattered over with vast ruins." It seems to General Cunningham not improbable that the modern name of Hashtnagar may be only a slight alteration of Hashtinagara, or "city of Hasti," which might have been applied to the capital of Astes, the prince of Peukelaotis. It was a common practice of the Greeks to call the Indian rulers by the names of their cities, as Taxiles, Assakanus, and others. It was also a prevailing custom amongst Indian princes to designate any additions or alterations made to their capitals by their own names. Of this last custom we have a notable instance in the famous city of Delhi; which besides its ancient appellations of Indrapastha and Dilli, was also known by the names of its successive aggrandizers as Kot-Pithora, Kila-Alai, Tughlakabad, Firuzabad, and Shahjahanabad. It is true that the people themselves refer the name of Hashtnagar to the "eight towns," which are now seated close together along the lower course of the Swat river; but it seems to General Cunningham very probable that in this case the wish was farther to the thought, and that the original name of Hashtnagar, or whatever it may have been, was slightly twisted to Hashtnagar, to give it a plausible meaning amongst a Persianized mahomedan population, to whom the Sanscrit Hastinagara was unintelligible. To the

same cause he would attribute the slight change made in the name of Nagarahara, which the people now call Nang-nihar, or the "Nine streams." In later times Pushkalavati was famous for a large stupa, or solid tower, which was erected on the spot where Buddha was said to have made an alms-offering of his eyes. In the period of Hwen Thsang's visit it was asserted that the "eyes gift" had been made one thousand different times, in as many previous existences: but only a single gift is mentioned by the two earlier pilgrims, Fa-Hian in the fifth century, and Sung-Yun in the sixth century.—*Cunningham's Ancient Geography*, pp. 49-51.

PUSHKARAM. This native feast only occurs every twelve years, and lasts during twelve days, takes place in Rajahmundry. Its chief ceremonies consisted in bathing. The Godavery, is the sacred river and the delight of all hindoos who come to bathe in it from places so distant as Balasore, Calcutta, and even the holy city of Benares.—*Ibid.*

PUSHM or Pashm also Pul, PERS. Wool. The Pushm of the wild sheep and ibex is of a delicate grey colour and finer and softer than that of the shawl goat. The wool produced in the Thull, is shipped at Bukkur, or Leia, and sent down to Bombay, and averages 10 Rupees a maund. In Loodiana district Pushmina is prepared from "Pushm," the fine hair of the Tartar goat. The hair is brought down on mules through Ladak, Rampoor and Bussahir, and in exchange for cotton piece goods, brass and iron are taken back. The price of Pushm varies from Rs. 2 a seer. On receiving the "Pushm" the manufacturer's first business is to separate the coarser from the finer or underneath hair; out of each seer about 6 chittacks of the latter are taken. It is then washed in rice water and made into thread. This sells at from Rs. 4 to Rs. 12 per seer according to quality. The thread made of the finest hair is woven into the well-known Rampoor chudders, which are extensively manufactured. From the coarser thread are made shawls of sorts and the cloth known as pushmina.—*Ann. Ind Adni*, Vol. xii, p. 108.

PUSHPAKAVIMANA, a self-moving chariot.

PUSHTANEH or Affghans.

PUSHT BARNI, HIND. *Uraria chetkubra*.

PUSHTOO. The term Affghan is acknowledged by a multitude of tribes speaking the same dialect—the Pushtoo or Affghani but the term itself has no known signification, and is manifestly borne by many people of very different origin, though the people are said to call themselves Pushtoon. According to Captain Raverty, the people who dwell about Cabul and Kapdahar, Sharawak and Pishin, are designated B'r-Pushtun or Affghans; and those occupying the district of Roh, which is near India, are called L'r-Pukhtun or Lower Affghans. Persian is the official language of Afghanistan, but the Pushto is alike the common tongue of the uneducated people, of the families of the Sadozye kings, and of the dwellings of the Amir. There are, however, two divisions of the Affghans, termed Pushtun and Pukhtun, who speak Pushto and Pukhto respectively. The Pushto being the western dialect with affinity to Persian, and the Pukhto the eastern with many Sanscrit and Hindi words. The Pushto is spoken, with slight variation in orthography and pronunciation, from the valley of Pishin, south of Kandahar, to Kafiristan on the north; and from the banks of Helmund on the west, to the Attock, Sindhu or Indus river, on the east; throughout the Sama or plain of the Yuzufzye's, the mountainous districts of Bajawar, Banjhora, Suwatt and Buner to Astor, on the borders of Little Tibet, a tract of country equal in extent to the entire Spanish peninsula. Also, throughout the British districts of the Derajat, Bannu Tak, Kohat, Peshawar and the Samah or plain of the Yuzufzye's with the exception of Dera Ghazi Khan, nine-tenths of the people speak the Affghan language. Since the invasion of Mahmud of Ghazni in the eleventh century, there has been a constant influx into India of Affghans, as conquerors and settlers and this has been so great from particular districts that some tribes have altogether disappeared from Afghanistan. In some localities in India, the Affghan settlers are said to have preserved the Pushto almost to its purity up to the present day, having from the outset married amongst themselves. In some parts of Bundelcund and in the territory of the Nawab of Rampur, whole towns and villages may be found in which the Affghan language is still almost exclusively spoken and is the medium of general communication. Captain Raverty considers that although on numerous points, the Pushto bears a great similarity to the Semitic and Iranian languages it is totally different in construction, and in construction, and in idiom also, from any of the Indu-Sanscrit dialects.—*Capt. H. G. Raverty's Grammar and Dictionary to the Pushto, Pukhto, or Affghan language.*

Putchuk is the name by which a fragrant root is designated in the price-currents of Calcutta and Bombay, whence it is exported to Canton, being highly esteemed by the Chinese as an incense, neither the plant which yields it nor the place where it grows were discovered until very recently. It is now known to be the Aucklandia costus and to be a native of Kashmir. The discovery is interesting, as the Putchuk is a substance which was known to the ancients. Dr. Royle, while in the north-western provinces of India, obtained a root which formed a considerable article of commerce, and which was said to be brought from still farther north, that is, from Lahore. It was warm and aromatic in taste, fragrant in odour, and frequently called Orris-Root (Iris-Root) by Europeans in India, though by the natives in northern India it is

called Kooth. On comparing specimens of Kooth which he obtained in northern India with what was called Putchuk in Calcutta, he found that they were identical, and he was subsequently informed by Mr Beckett, who was long settled as a merchant in northern India, that what the latter purchased from Umritser under the name of Kooth he sold in Calcutta by that of Putchuk, so that there can be no doubt of the identity of the two substances; but all that had been ascertained with respect to the place where it was produced was, that it seemed to be to the north of the Sutlej. Kooth, being used in India as a medicine, as well as exported to China, is described in the Persian works on *Materia Medica* in use in that country, and has assigned to it Kust as the Arabic, Kooshta as the Syriac, and Koostus as the Greek name. Three kinds are described. Dr. Royle states that he was only able to meet with two kinds in India, one called Koost-Hindee, and the other Koost-Arahee. These evidently refer to two of the three kinds of *Costus* described by Dioscorides as the Arabian, Indian, and Syriac. There can be little doubt therefore that the Kooth or Putchuk is one of the kinds of *Costus* of the ancients, which was highly esteemed by them and formed an ingredient in their most famous compound alexipharmic confections, such as the *Theriaca* and the *Mithridatium*. It was also highly esteemed by them as an incense, as, in the line of Propertius—"Ure puer *costum Assyrium redolentibus aris*;" and is mentioned by Horace as '*Achæmenium costum*. ('*Od.*, iii. 1.) The identity of Kooth and *Costus* was, however, long ago ascertained, though not generally known, as is evident in the following passage from Garcias ab Horto, in Clusius ('*Exot.*, lib. x.) "*Est ergo Costus dictus Arabibus Cost aut Cast; in Malacca, ubi ejus plurimus est usus, Puchò, et inde vehitur in Sinarum regionem.*" In McCulloch's '*Commercial Dictionary*,' Putchook is described as "the root of a plant growing in Sind. When burned it yields a fine smell. The Chinese beat it into a fine powder, which they burn as incense in the temples of their gods." Of the Putchuk, 6,697½ bazaar maunds, of the value of 99,903 rupees, were exported from Calcutta in the year 1837-38. On Dr. Falconer's proceeding on his journey to Cashmere, Dr. Royle requested him to make inquiries respecting this substance, and he discovered that it was exported from the valley in large quantities to the Punjab, whence it finds its way to Bombay and Calcutta; and that it is sold in China at an advance of about 300 per cent. on the price at which it is gathered in Cashmere. Dr. Falconer subsequently found it growing in great abundance all round the elevated summits of Cashmere.

From the plants with which it is associated, and the circumstance under which the Koot grows, being one of the Compositæ, or Thistle tribe with feathered seed, of which when once established the dissemination becomes easy, Dr. Falconer had no hesitation in thinking that it could be produced to an unlimited extent, of the best quality, in the Himalaya at elevations of from 7,500 to 9,000 feet above the sea, and that the Choor mountain alone might be brought in a few years to produce thousands of maunds of it. Preparatory to diffusing the Koot, or *Costus*, he introduced it into the Himalayan nursery attached to the Saharanpore Botanic garden. Finding that it belongs to a new genus, he named it *Aucklandia*, in honor of George, earl Auckland, Governor-General of India. In the mountains of Cashmere, it is called Koot, it is a gregarious herb, six or seven feet high. Its roots are dug up in September or October, chopped up into pieces from two to six inches long and exported without further preparation. The greater portion being sent via the Punjab to Bombay, whence it finds its way to the Red Sea, Persian Gulf and China. Another portion being sent across the Sutlej and Jumna to Hindustan. In Cashmere the cost of its collection and transport to a mercantile depôt, is about 2s. 4d. per cwt.: but at Jugadree on the Jumna, it has increased to about 16s. 9d. or 23s. 4d. per cwt., and in the Chinese ports it fetches nearly double that price the cwt. The Chinese burn the roots as incense in the temples of their gods; and they also attach great efficacy to it as an aphrodisiac. The imports into Canton in 1850, were 854 piculs, valued at 5,150 dollars. In Cashmere it is chiefly used for the protection of bales of shawls against insects. The exports for Calcutta average about £1,500 annually.—*Royle, on the Productive Resources of India; Royle's Illustrations of Himalayan Botany*, p. 360; *O'Shaughnessy's Bengal Dispensatory*; *Simmond*.

An ornamental tree growing all over India, from the Himalaya to the south of the peninsula, and a native of the various mountainous countries of Coromandel and Hindoostan. Coromandel, Patna, Monghir hills, and from Sylhet to the Kherree jungle, where it grows to be a large timber tree with an erect straight trunk and a large spreading shady head composed of innumerable expanding branches, with bifarious branchlets. Flowering time March and April and the fruit ripening in January. Wood white, close-grained and very hard. The Sanscrit name is compounded of pootra, a son ; and jeeva life. The hindoostani name jeeapootra, is similarly derived. The nuts are

strung by parents round the necks of their children, to keep them in health. Extensively sold in the bazaars of upper India.—*Roxb.'s Fl. Ind.*, Vol. iii, p. 766 ; *Royle's Illust.*, p. 100 ; *O'Shaughnessy*, p. 611 ; *Rohde's MSS.*

PUTRA KARI, SANS. Euphorbia netifolia.

PUTROTSAVAM, on the birth of a brahmin child, the ceremony called "Putrotsavam" is performed and on this occasion, the father presents sugar and sugar-candy to relatives and friends. On the 11th day, the mother is anointed with the oil of the oriental sesamum. This practice of anointing with oil, is wholly confined to the hindoo community, the mahomedans whether of India or western Asia are not acquainted with it, and it may therefore be surmised that the Arab descendants of Ismail separated at an age when the ancestors of the Hebrew people had not adopted the rite. It is probable that the Hebrews learned the practice in Egypt or from their Assyrian neighbours, and that the anointing of kings which European nations have adopted was handed down through the Old Testament. On the same day (11th) "Punyahavachanam" or the purification rite for the mother and house is performed. It is then that the child receives its name—that of some one of its grand, or great grand parents,—by the father writing it three times, with a golden ring, in unhusked rice, spread on a plate. This naming is called "Namakaranam," and is followed by the guests bestowing blessings on the young one, as they scatter rice, coloured with turmeric, over it, and the mother who are seated in the midst of the assembly. The father then distributes money to the poor, and entertains relatives and friends. On this night, for the first time, the child is put into the cradle by the female guests, some of whom sing religious songs while others rock the little one, and at the close, the assembly are dismissed after being presented with betel-nut, plantains and boiled pigeon pea, Cajanus indicus. The birth of a girl is less a source of rejoicing because of that part of the hindoo creed which lays down that parents and other ancestors attain Swargalocum or Indra's heaven, through a son's efforts.

PUTRUJ BARK, HIND. Cinnamomum nitidum, *Nees.*

PUTRAY, a board on which dough is kneaded and moulded.

PUTRONJI. See oil.

PUTSA-KAIA, TEL. Colocynth. Cucumis colocynthis.

PUTSA PESALU, TEL. Phaseolus radiatus.

PUTSO, BURM., a cotton cloth, about four yards in length and one in breadth, which, with Burmans, is put round the hips, and when worn long extends to the ankles. In the absence of

the jacket or "Enji," the long end of the Putso is thrown over one shoulder, in a graceful manner, and then it not a little resembles a highland plaid and kilt.—*Winter's Burmah*, p. 54.

PUTSUN, HIND. *Crotalaria juncea*.

PUTTA, Qu. Patta—? *Corchorus olitorius*.

PUTTA, TEL. Bark.

PUTTA, or Puta, TEL. *Wrightia tomentosa*.—*Rom. Et. Sch.*, W. Ic.

PUTTA BUHYE, the great 'register of patents' of Mewar. Heental was burthened with the service of fourteen horse and fourteen foot; its rek'h, or nominal value, in the putta-buhye or 'record of fiefs', being seven thousand rupees; Buhye is the ordinary term for a ledger.

PUTTAH, HIND. A double-edged sword, with a guard-handle, or basket-hilt.—*Simmond's Dict.*

PUTTAL, TAM. Putta, TEL. Bark.

PUTTAKI, SANS. Alum.

PUTTA PODARA YARALA, TEL. *Vallis dichotoma*, Wall., W. Ic.

PUTTEE or Pattee, HIND. Writing leaves of the Palmyra, see Olay.

PUTTEE, HIND. A mohamedan rite held on the third day after the woman's confinement.—*Herkl.*

PUTTEUN KI SEND, DUK. *Euphorbia netifolia*, Linn. *E. nereifolia*.

PUTTE WAGH, MAHR. *Felis tigris*, Linn.

PUTTEE, HIND. The side locks over the temples.

PUTTEN, a Cochin-Chinese coin of the value of ten pice (4d.,) which has recently become the general circulating medium, available for all ordinary purposes. Eighteen putten and six pice, should go to the rupee, but it varies

two or three pice, according to local circumstances.—*Simmond's Dict.*

PUTTI, TEL. Properly Patti or Pratti, *Gossypium indicum*, Lam.

PUTTOO a thick woollen blanket woven on the Spiti hills. A coarse thick fabric made of the refuse wool and long hair from the shawl goat.—*Simmond's Dict.*

PUTTOO a Rajpoot sovereign who perished in the defence of Cheetore; he was only sixteen years of age, and had lately married. To check any compunctious reluctance that he might feel in leaving his wife behind, his heroic mother armed the young wife as well as herself and with her descended the rock and the defenders of Cheetore saw her fall fighting by the side of her Amazonian mother.—*Tr. of Hind.*, Vol. ii, p. 381.

PUTTOOA or Juanga, a forest tribe inhabiting the tributary Mahals of Cuttack to the south of Singhbhum, in the Mahals or Killahs of Keonjur, Pal Leyra, Dhekenal, and Hindole. They are said to number, 1,500 persons of all ages and to occupy 15 different localities, thirty villages in Keonjur, and six or seven in Pal Leyra and Hindole. Their stature is diminutive, men 5 ft. 2 in., women, 4 ft. 3 in. or 4 in. The men dress like peasantry of the country; the women, however, only cover their persons in front and behind by a bunch of twigs with the leaves attached, kept up by a strip of bark or a string of beads. These leaves are changed daily. Their pursuits are chiefly those of the chase, in which they employ dogs, and the bow and arrow.—*Ben. As. Journ.*, No. 4 of 1856; *Dalton's Ethnology of Bengal*.

PUTUN, see Korum devi.

PUTURA, a river of Bhopal.

PUTUR, 13° 26'; 79° 34', in the Carnatic, on the northern foot of the Nagari pass. Dak bangalo, 523 feet above the sea.—*Schl.*, Ad.

PUT-VER, MALEAL. Maddar.

PUTU VERUSEN NAR, MALEAL. *Crotalaria juncea* fibre.

PUTWA, HIND. A braider, a maker of fringe and tape.

PUTWA, HIND. String and rope made from the fibre of *Bauhinia racemosa*.—*Simmond's Dict.*

PUTWARREE, HIND. A registrar or collector under an Indian zemindar, or land-holder.—*Simmond's Dict.*

PUTWURDHUN, a powerful family, of Mahratta brahmins, with estates near Kolapore.

PUVANDI, TAM.? *Sapindus emarginatus*, Vahl.

PUVVULU PUTIKE, TEL. The common yellow composite.

PUVU MARAM, or Pu maram, TAM. *Scilla leiochera trijuga*.

PUVUNU, SANS. from poo, to purify.

PUWAH or Puwa. TRANS.-INDUS, manured soil.

PWAI NGYET, BURM. Is a resin found in the bazaars throughout Pegu. It is yielded by the *Shorea robusta* or the Saul-tree of India, which occurs plentifully in the forests on the Shan side of the Sitang, east of Toungho, and also, but to less extent, in the forests of the Prome district. An observer had not found, however, that this dammer is obtained from these forests, as none of the trees appear to have been perforated for it, so that the supplies of this article are probably brought down to Pegu from forests beyond the frontier.—McClelland.

PWAN-HIA, CHIN. Midsummer root.

PWO, eight tribes in Burmah speak the Pwo dialect. The Pwo and the Sgau as we approach the sea-board, are found mingled more or less together from Bassein and the Sitang to Mergui, living in the same villages, but apart from, though more numerous than, the Sgau. The Sgau call them Pwo, but their own name is Sho, and the Burmese call them Meetkhyen, or in some sections Talaing Karen. They are muscular and prefer the plains. All the Pwo burn their dead.—Mason, p. 92: See Karen.

PWON, a tribe with Shans on their north and south on the right bank of the Irrawaddy in L. 24° 30' N.

PYÆ BAN NYO BURM. *Cassia*, sp.

PYAK, HIND. *Alnus*.

PYAUNG-PYION, BURM.? In Tavoy, a compact, heavy, yellow wood.—Mr. Blundell.

PYCNONOTUS HÆMORRHOUS, Gmel. The bulbul, the Condatchee bulbul, which, from the crest on its head, is called by the Singhaless the "Konda cooroola," or Tuft bird, is regarded by the natives as the most "game" of all birds; and training it to fight was one of the duties entrusted by the kings of Kandy, to the *Booroowa*, or headman, who had charge of the king's animals and birds. For this purpose the bulbul is taken from the nest as soon as the sex is distinguishable by the tufted crown; and secured by a string, is taught to fly from hand to hand of its keeper. The bulbul of Ceylon, the Condatchi bulbul, is the

PYRAMID.

Pycnonotus hæmorrhous. Another bulbul is the *Pycnonotus leucogenys*.—Gmel.

PYDI-TANGEDU or Pydu, TEL. *Cassia sophora*.

PYEN DANG NA IEN, BURM. *Sida*, sp.

PYEN-KADO, BURM. *Inga xylocarpa*.

PYEN-MA, BURM. *Lagerstroemia macrocarpa*, Roxb. In Amherst, its timber used for house posts, carts, boats, paddles, oars, &c. It is a capital wood, and would answer for all the purposes of common saul; specific gravity 0.920.—Cat. Ex. 1851.

PYENG-KHADO, BURM.? In Tavoy, a small sized, heavy, close grained, red wood.—Mr. Blundell.

PYHURA, HIND., of Bundelcund, Cotton-gatherer.

PY-IN-TA-GAR-NE-THI, BURM. Galls.

PYKAR, HIND., of Doab, Cotton-gatherer.

PYKARA, a small river on the Neilgherry hills.

PY-NA-THE, BURM. *Artocarpus*, species.

PYOO, BURM. *Arundo*.

PYOUNG, BURM. *Sorghum vulgare*, also *S. saccharatum*, Pers.

PYOUNG-BOO, BURM. *Zea mays*, Linn., Roxb., the Maize.

PYRAMID. The three principal pyramids of Egypt are seen from Cairo. They stand upon the first hill between Cairo and the western bank of the Nile, in going thither from Geesh. They are built of soft calcareous stone, of the same nature as the rock on which they stand. It is thus presumable, that all the polished stone has been taken from the same place, and wrought at small expense. The purpose of erecting the pyramids of Egypt, seems to have been to use them as they have been supposed to be the granaries of Joseph; to have been built by king Saurid, before the flood, to preserve himself and the public records; as having been built by the Israelites in their captivity (Josephus) as temples; and the stone chest a font, (Shaw and Bryant;) the tomb of Cheops, who is supposed to have built them; as having been built by the shepherd kings, in the early Pharaonic ages; they have been supposed to have been built for astronomical purposes, (Wilkinson) and to have served for tombs. (Wilkinson.) To keep the people employed and poor. (Aristotle, vol. vii); the historian Manetho says, that Suphis and his successor built the two greatest of these pyramids. Each of these huge piles stands upon a square plot of about eleven acres, and its four sides met at a point about five hundred feet high. The stones were quarried out of the neighbouring hills, and some from the opposite side of the Nile, and are all of a great size, and carefully cut into shape. In the limestone quarries of Toora, opposite to Memphis, the sculptures on the face of the

PYRETHRUM INDICUM.

rock tell us of the size of the stones there cut. In one place six oxen are dragging along a sledge with a block of stone on it, which measures eight feet by four; and the early date of the sculpture makes us suppose that this stone was to form a part of the casing for the pyramids. We see in these buildings neither taste nor beauty, but their size and simplicity raise in us a feeling of grandeur, which is not a little heightened by the thought of the generations which they have outlived. They take their name from the words Pi-Rama, the mountain, and though when compared with mountains they may perhaps seem small, when measured by any human scale they are found to be truly gigantic. They are the largest buildings in the world. It is not easy to imagine the patience needed to build them.

First Pyramid, Baso,	746 ft. sq.	Perp. height.	450 ft.
Second "	" 690½ "	" "	447 "
Third "	" 354½ "	" "	203 "

The second pyramid is in some points of inferior workmanship to the great one.—*Sharpe's History of Egypt, Vol. i, p. 24.*

PYRAMIDAL FORMS, are those ordinarily given to the temples of the non-Aryan races of India. All Fijian temples have a pyramidal form and are often erected on terraced mounds; in this respect reminding us of the ancient central American structures. We meet the same terraced mounds also in Eastern Polynesia, with which Fiji and all other groups of the south sea, shares the principal features of its religious belief. The supreme god in Fiji is Degei (pronounced Ndengei) known in the other groups as Tanga-roa, or Taa-roa, Tanga being his proper name, "roa" an adjective, signifying "the far-renowned," perhaps, also, the "most high." To him is attributed the creation and government of the world; and there are no images of him, nor of any of the minor gods, collectively termed "Kalou." His sway is universally acknowledged by the natives, and no attempts are ever made to elevate any local gods above him Bure-Kalon is the temple.—*Galton's Vacation, Tourista, p. 269.*

PYRETHRUM, GR., of Dioscor. *Anthemis pyrethrum, H. Kunth.*

PYRETHRUM INDICUM, H. Kunth.
Anacyclus pyrethrum, Dec. Anthemis pyrethrum, L.
 Indian fever few, ENG. Pyrethron, GER.
 Pellitory of Spain. " Zoenil, PUNJAR.
 Akerkurra, HIND. Akarakurn, TAM., TEL.

This root was known to Dioscorides and is still employed in Eastern medicine. The plant is a native of the north of Africa, whence it has been introduced into the south of Europe. Hayne believes that the root is yielded by a nearly allied species which he calls *A. officinarum*, ix, t. 46, and which he found cultivated in Thuringia.—*O'Shaughnessy.*

PYRUS COMMUNIS.

PYROLIGNEOUS ACID, is made from cocoanut shell in India, Acetic acid, from *Cytisus cajan*.

PYROPE. A variety of garnet, brought from Burmah. It is characterized by giving to transmitted light a yellow tinge, or as the natives say, the colour of the ox's gall; and hence the Burmese name, which, in Pali, signifies ox-gall.—*Mason.*

PYROSOME, a genus of molluscs which is often met with spread over great tracts of the tropical oceans, which at night gleam with their phosphorescent light. These, like the Compound Ascidians, consist of large colonies of small individuals, aggregated in the form of a cylinder open at one end. These molluscs are often observed in shoals floating on the surface of the sea, emitting a bright phosphorescent light of a greenish lustre.—*Hart.*

PYRRHOCORAX ALPINUS, the alpine chough, feeds on mulberries. This species is easily distinguished from the Cornish chough (also a native of Ladak) by the bill being shorter, and yellow, instead of red.

PYRRHOSIA HORSFIELDII, Blume.

Horsfieldia odorata, Wal. Myristica horsfieldii, Spr.
 Wild nutmeg, ENG. | Kut-judika, TAM.

A tree of the forests of Travancore; its mace is used in medicine.—*Drury's Useful Plants.*

PYRRIULA AURANTIA is the orange coloured bullfinch and red-headed bullfinch is *P. erythrocephala*; the latter is not uncommon in shady groves and woods of the lower and middle regions; about 6 inches in length, head, neck and breast reddish yellow, becoming fainter towards the belly; the vent and rump white; back bluish-ash; quills and tail glossy black.

PYRULA, a genus of molluscs.

Kummitel,	"	Batank,	"
Pear tree,	ENG.	Kishia, Bahira,	PUSHTU.
Nak, Amrud, Naspoti, HIN.		Choui,	

This plant of Kaghan, is the pear tree of English orchards, easily distinguished from the apple tree by the shape of its fruit. The pear tree is not common in Deccan gardens though some trees are to be found having been brought chiefly from Bangalore; the fruit is of a tolerable large size but coarse and hard, which only renders it fit for baking and stews. The same kind of fruit is found in the upper provinces of Bengal. Wallich found a species of pear tree growing on limestone

mountains, near the Irawady; Mr. Mason had never met with it in the Tenasserim provinces.—*Cleghorn's Punjab Report, Kulu and Kangra, p. 81; Eng. Cyc.; Riddell; Mason's Tenasserim*

PYRUS CYDONIA, Linn.

Cydonia vulgaris, Pers. | Behee, HIND.

The quince tree has probably been introduced from China or Bengal, but is now to be met with in many gardens. It grows like the apple. The fruit is plentiful at Sattara, and Dr. Riddell met with it at Poonah. In other parts of the Deccan he has seen the tree in blossom, but the fruit did not set,—perhaps for want of proper treatment.—*Riddell.*

Choong; Choont,	PANGI.	Li,	

The apple tree is found in the Sutlej valley between Rampur and Sungnam, in Persia, all over the Deccan, and at Bangalore. The apples of Kunawar want flavor compared with those in Kashmir. The two sorts of apples commonly found in most native gardens in the Deccan, are said to have been first introduced from Persia. They are of a small description; one sweet and luscious, grows in bunches; the other, which is larger, has a rough taste, and is better adapted for tarts. The trees may be propagated by layers, suckers, and even cuttings. The young plant should never be allowed to throw out branches at less than two or three feet from the ground, all the buds beneath must be rubbed off. Never plant them closer to each other, than from nine to twelve feet and if there is sufficient ground, keep them separate from other trees, so that they can either be wintered or watered as required. Remove all suckers round the stem of the tree, or from the roots, unless required for stocks, then cut them clean off with a sharp knife. The trees may be opened immediately after the rains, if not in blossom. Pluck off all the leaves carefully and beware, in so doing, that the blossom

buds are not injured, which native gardeners in the careless manner of stripping the leaves, are very apt to do;—then prune the tree. As soon as the blossom appears set, put plenty of old rich manure to them, and water well every third day until the fruit is nearly ripe. If you continue watering after this, it makes the fruit mealy and insipid. When the fruit is all gathered, cease to water the trees, and as soon as the leaves turn brown and dry, which will be in the course of a month, then open the roots for two or three days, cover with manure again, and water well as before, when you may probably get a second crop in April or May.—*Cleghorn's Punjab Report, p. 65; Riddell, on Gardening.*

PYRUS SINICA, the Sand pear of China. It is cultivated in Northern India.

A small tree grows in all the warm valleys of Kamaon, wood close-grained, brown, compact, used in Ladak for boards of books and printing blocks and for making native combs. The fruit eaten, when over-ripe and decaying, like the European medlar. The elevation is from 3,000 to 7,000 feet. The tree is frequent in Murree and Hazara. This is found in the Sutlej valley between Rampur and Sungnam at an elevation of 3,000 to 7,000 feet. When rotten, the fruit becomes sweet.—*Thomson's Travels; Cleghorn's Punjab Report, p. 65.*

PYSONEE, a river near Singpoor in Banda.

PYTAN-KAI, TAM. *Dolichos tranquebaricus.*

PYTHAGORAS, a learned Grecian. See Damon, Kapila, Vedas.

PYTHAGOREAN BEAN, *Nelumbium speciosum, Willd.*

PYTHEUS, see Serpent.

PYTHIAN APOLLO, see Krishna.

PYTHON, a name of Apollo. See Krishna.

PYTHON, of the Greeks, the Peten of the Hebrew and Boeten of the Arab, was a fabulous huge serpent. It had an oracle at Mount Pernassus. Apollo is said to have slain this serpent, hence his name Pythius.

PYTHONESS, (*πυθωνες*) of the Greeks, was a divining woman, as in Acts, xvi, 16.

PYTHON, a genus of reptiles.

Fam. Xenopeltidae.

Xenopeltis unicolor, Rein., S. India, Pegu, Andamans.

PYTHON MOLURUS.

Fam. Pythonidae.

Python reticulatus, *Schn.*, Nicobar, Tenasserim.

" *molurus*, *Linn.*

Boa constrictor, *Linn.*

Gongylophis conicus, *Schneid.*, Upper India.

Eryx johnii, *Russell*, Pind Dademkhan.

The python snake is often observed hunting after frogs in damp situations; it is known to the natives by the name of Ajda, and is a true python, and not as some travellers have named it the boa constrictor, which it is needless to remark is not a native of Asia.

PYTHON MOLURUS, *L.*

P. trivittatus, *Schl.—Russell*, 1, *pl.* 22.

Boa or Rock snake, of Europeans in Madras.

PYU.

This is found all over the country, but has not been seen longer than 19 feet. One was killed in Travancore, after having swallowed a doe-spotted deer.

PYTHON RETICULATA, *Gray*. It is the Ceylon boa, attain a length of 20 feet. Anakonda of Ceylon. It is occasionally of great size, but perhaps rarely exceeding twenty feet, though Mr. Sirr mentions that when full-grown, it is said to measure from 17 to 20 and even 25 feet long, with a circumference of two and a half feet.—*Sirr's Ceylon*.

PYU, the Burmese who occupied Prome distinct from the Burmese proper.

Q is the seventeenth letter of the English alphabet, and has but one sound, somewhat similar to *k* or hard *c*, but formed near the root of the tongue. In English it never ends a word, as it does in French and other European languages. Its nearest sound in the Arabic, Persian and Hindustani is represented by the letter ق as in taluq, killah, but it may be represented by the letter *k*. In English it is always followed by the letter *u*, the two letters being in general, pronounced like *ku*, as quake, quack, quick, queen, but in some words the *u* is silent as in pique. But, although the three consonants, C, Q, X, are called superfluous in English grammars, Q, historically represents a Hebrew and an Arabic letter: hence it has been generally so employed by the learned. The English always have *u* after Q. In Qâl قâl the Q is a deep soft K, formed at the root of the tongue.

QADIRI, a subjunction to names of a tribe of fugueers. Qadireea, an order of devotees.

QADIR WALLEE, a celebrated mahomedan saint.

QAF, a fabulous mountain.

QAFEELA, AR. A body of travellers, a caravan.

QAMUT, AR. Part of the Takbeer, or mahomedan creed.

QAZEE, AR. A judge, civil, criminal, and ecclesiastic.

QÆAM, AR. The standing position in mahomedan prayer.

QIBLA, AR. The temple of Mecca.

QOOFOL, HIND., a lock for resolving mysteries.

QOORBANEE, AR. The sacrifice, see Kurban, sacrifice.

QOOTOOB SAHIB, or Qoottoob ood Deen, lies buried at Qoottoob, a town near Delhi named after him, in which the late Shah Alum and many members of the royal family of Delhi are buried. His tomb is much frequented by pilgrims, he being one of the most renowned and venerated of the moosulman saints.

QORAN, AR. The Holy book of mahomedans. It was originally in Arabic, but is now in Persian, Hindi, Malay. It was translated into English by Mr. George Sale.

QOWL-BEERA, HIND. The betel contract, a ceremony of mahomedans.

QUADRUMANA, Cuvier's name for his second order of Mammiferous animals, an order which must be always viewed by the Zoologist

with great interest, inasmuch as it contains those forms among which will be found the nearest approach—though the distance is still great—to man. The order Primates of Linnæus consisted of the genera Homo, Simia, Lemur, and Vespertilio.

QUAGGA, also written couagga, is the equus quaccha, Gm., a native of Africa. It resembles the horse more than the zebra. Its voice is not unlike the bark of a dog.—Cuvier. See Kyang.

QUAH-LAY, MALAY. Mucuna pruriens.

QUAIL. Mr. Gould recognises the common quail of India as distinct from the European quail. The quails of British India, are arranged by Jerdon under the Genus *Perdica*, the dwarf partridges, or bush quails, and the sub-family *Coturnicinae* or true quails, also the sub-family *Turnicinae* or bustard quail.

Perdica cambayensis, Latham, jungle bush quail, all India.

„ *asiatica*, Latham, rock bush quail, Dekhan S. of Nerbudda.

„ *erythrorhyncha*, Sykes, painted bush quail, Ghats of S. India.

Coturnix communis, Bonaterre, large gray quail, or European quail, Europe, India.

„ *coromandelica*, Gmel., rain quail, black breasted quail, all India.

„ *novæ-zealandiæ*, O. & G., New Zealand.

„ *pectoralis*, Gould.

„ *realteni*, S. Müller.

„ *histrionica*, Hartl.

Excalafactoria chinensis, Linn., blue breasted quail, British India to Philippines.

„ *novæ-guinæ*, Gmel., New Guinea.

„ *adamsoni*, Verreaux, Celebes.

„ *minima*, Gould, „

Turux taigoor, Sykes, black breasted bustard quail, Ceylon, British India.

„ *ocellatus*, Scopoli, Hill bustard quail, Himalaya to Malayana.

„ *dussumierii*, Temm., larger button quail, all India.

Sykesii, A. Smith, button quail, all India.

Coturnix communis, the common quail of Europe, Asia, Africa, is chiefly migratory and is abundant in India, though M. Gould considers the race of this country to be distinct. The rain-quail (*Coturnix coromandelica*) is plentiful during the monsoon. The Bush-quail occurs in low jungle. Now and then among the prickly shrubs by the margins of the fields, a covey of ten or twenty bush-quail (*Perdica asiatica*) sprang up with a whirring noise. Quails are haunted in N. China. The hawk is loosed to the quail which it seizes in its talons,—the falconer then rushes up and

QUARTZ.

takes all in a net.—*Adams; Jerdon; Blyth.* See Birds.

QUAKERS, see Sands.

QUAKING GRASS, Briza.

QUAMOCLIT, a genus of climbing plants of the natural family of Convolvulaceæ, chiefly found in the hot parts of America, but species are indigenous both in India and China.

QUAMOCLIT ALBA, pure white, common, easily grown from seed, *Jaffrey*.

QUAMOCLIT COCCINEUM, *Choisy*.

Ipomœa coccinea, L. | *Convolvulus coccineus*, Spr.

A native of West Indies.

QUAMOCLIT PENNATUM, *Voigt*.

Convolvulus pennatus, Des.

" quamoelit, Spr.

" pennatilius. Salis.

Ipomœa quamoelit.

Myat lae nee,, BURM. | Surya ratnalu, TEL.
Jasmine rouge, FR.

The French and Burmese call this beautiful little creeper red jasmine, the English name it China creeper, and the botanists quamoelit or dwarf bean. It is quite naturalized throughout the Tenasserim provinces, the French name is both more descriptive and euphonious than either of the others.—*Roxb; Mason; Voigt*.

QUAMOCLIT PHŒNICEUM, *Choisy*.

Ipomœa phœnicea, *Roxb.* | Kasi ratnalu, TEL.

A very handsome climber with crimson flowers, tube long and slender; grows readily from seed—*Jaffrey*.

QUAMOCLIT VULGARIS. The Indian forget-me-not, sometimes called the star creeper, from the shape of the flower which is of a deep rosy red.—*Jaffrey*.

QUARA TAUUIL, EGYPT. *Cucurbita lagenaria*—*Linn*.

QUARRYMEN, or masons the Uperawanloo, or Wadi wanloo of Telingana, are employed in digging tanks, making salt, and in road-making.

QUARTZ is nearly pure silica. It occurs both massive and in crystals of all sizes and of a great variety of colours. It breaks into tabular, cubical, pyramidal, and conical masses; usually shining or glistening on the surface; the fracture is conchoidal in one direction, coarse and splintery in the others; occasionally it has a parallel fibrous fracture; but the surfaces are most frequently triangular on one side. This and the conchoidal fracture with the shining or translucent appearance, distinguish it from felspar. It crystallizes in hexagonal pyramids, is harder than felspar, cannot be scratched by steel, becomes opaque when heated but does not melt without addition. Specific gravity 2.650. Is much used in the bodies of pottery and in making enamel and glass. Quartz rock has been found the richest in metals of all the

QUEEN LAGERSTRÆMIA.

Indian rocks. At Callastray it contains lead ore mixed with silver; at Nellore, copper; at Nagpore, manganese and lead ore and copper; micaceous iron ore is a very common product of this rock.

Green and red Quartzose sandstone of Vellore, used formerly by farriers, but now replaced by sills of corundum and lac.

Yellow Quartzose sandstone, of Woodia-gherry used formerly for giving a first edge to swords, daggers and implements, hard, rough and well suited for grindstones.

Quartz, is the hardest component of granite, and is also the least liable to change, it forms about one-third of the whole constituents, and is a source from which much of the sand on the surface of the globe is derived.—*Journ. of Asiatic Soc., Vol. xiii, p. 161; M. E. J. R.*

QUASI, see Khyber.

QUASSIA, a bitter drug, the woods of *Quassia excelsa*, and *Q. amara*.

QUASSIA AMARA.

Bitter quassia, GER. | Quassienholz, GER.
Bois de quassie, FR. | Lenode quassia, SP.

This native of Surinam, Guiana, Colombia, and Panama, was introduced into Bengal by Lord Auckland. It thrives tolerably well in the Calcutta Garden. Quassia wood is a very pure and simple bitter, and has been much employed in bilious and intermittent fevers, dropsies from debility, atonic gout, and indeed in all cases in which bitter tonics are advisable. The English brewers use it freely as a substitute for hops, although it is thought to have some degree of narcotic power, a decoction of quassia being much used as a poison for flies. Quassia is with much difficulty reduced to powder, and is consequently given in the forms of extract, tincture, infusion, and decoction.

QUASSIA SIMARUBA.

Bitter, or mountain damson.

Simaruba amara, *Lindley*.

The bark is used medicinally.—*O'Shaughnessy, p. 267.*

QUEEN OF SHEBA, see Saba.

QUEEN'S WOOD, Brazil wood, Cæsalpinia.

QUEEN COCOANUT, the fruit is of a bright gold colour, and the blossoms, both of that and of the common kind, are very effective among the dark leaves.—*Frere's Antipodes*, p. 162.

QUEEN MOUNT, see Malacca fort.

QUEIJO, Port. Cheese.

QUEL PERT, an island in the gulf of Leatong, about 42 miles long and 17 miles broad. The Quelpertians are very unprepossessing in their appearance, rude and boisterous in their manner, and of very gross habits.—*Marryat's Indian Archipelago*, p. 182.

QUEMOY, A large island separated from Amoy by a channel from 5 to 7 miles wide, in the centre of which is little Quemoy island.

QUERCACEÆ, *Mirb.* The nut tribe of plants comprising 5 gen. 60 species, viz., 2 *Carpinus*; 2 *Corylus*; 9 *Castanea*: 46, *Quercus*; 1 *Lithocarpus*.

QUERCUS. The oaks, and the chestnuts are well-known for their rich and luxuriant growth, and as forming the ornaments of European forests; The barks of oaks, alders, birches, willows and poplars abound in gallic acid and tanning, and all have therefore been frequently employed for that purpose, also as tonics and febrifuges, *Quercitron*, the bark of the North American *Quercus tinctoria*, dyes wool yellow. Gall-nuts called majoo phul, are imported into India, being produced by the puncture of *Cynips quercusfolii* or *Quercus insectoria* a native of Asia Minor, Armenia, and Kurdistan. *Q. Ilex* and *Q. Cerris* afford inferior galls. The cupules of the glands of *Q. Aegilops*, called velonia and velani (a corruption of *βελαν*) and velameda by the modern Greeks are collected in Ceos, and used for the same purposes. The Kermes insect fixes itself upon *Q. coccifera*, hence called Kermes oak, a native of the S. of Europe and N. of Africa, *Q. Ballota*, sweet-acorn oak, that probably described in Persian works under the names shah-buloot and bulloot-ool-mulik, is a native of Spain. N. of Africa and of parts of Greece; this having acorns free from tanning has been long used as food by the inhabitants of the above countries. It might, very probably, as well as the Cork-tree, (*Q. Suber*), a native of the hot parts of Spain and France, be naturalised in the plains of Northern India; where *Q. incana*, from elevations of 5,000 to 7,000 feet in the Himalaya, is perfectly at home. The acorns of this species are sold in bazaars under the name bulloot, being used by the natives in medicine. The nuts of others of the Amentaceæ are used for food as Spanish chestnuts, the beech and hazel-nut, the first contain sugar,

and the two latter much oil, for which they are often subjected to expression. The nuts of the hazel, abundant in the Himalaya, may be met with in bazaars under the name binduk or finduk. An edible nut is afforded by the Indian chestnut. *Castanea indica*, *Rowb.*, a native of the mountains of Sylhet, where it is called nikari. Wallich found seven different species of oak growing in Burmah and on the Tenasscaim Coast, *Quercus fenestrata*, *Q. turbinata*, *Q. velutina*, *Q. Amherstiana* and *Q. Tiribæ*. Three or four are natives of the Tenasserim provinces, and all afford useful timber, though inferior to the English oak. The following grow in Japan:

<i>Quercus glabra</i> , <i>Thbg.</i>	<i>Quercus variabilis</i> , <i>Bl.</i>
„ <i>acuta</i> , <i>Thbg.</i>	„ <i>aliena</i> , <i>Bl.</i>
„ <i>glauca</i> , <i>Thbg.</i>	„ <i>crispula</i> , <i>Bl.</i>
„ <i>cuspidata</i> , <i>Thbg.</i>	„ <i>burgerii</i> , <i>Bl.</i>
„ <i>serrata</i> , <i>Thbg.</i>	„ <i>sessifolia</i> , <i>Bl.</i>
„ <i>glandulifera</i> , <i>Blume.</i>	„ <i>salicina</i> , <i>Bl.</i>
„ <i>dentata</i> , <i>Thbg.</i>	„ <i>myrsinæfolia</i> , <i>Bl.</i>
„ <i>phyllyraoides</i> , <i>A.</i>	„ <i>gilva</i> , <i>Bl.</i>
„ <i>sieboldiana</i> , <i>Bl.</i>	„ <i>grosseserrata</i> , <i>Bl.</i>
„ <i>urticæfolia</i> , <i>Bl.</i>	„ <i>lacera</i> , <i>Bl.</i>
„ <i>canescens</i> , <i>Bl.</i>	„ <i>marginata</i> , <i>Bl.</i>
	„ <i>laevigata</i> , <i>Bl.</i>

The *Quercus* genus is found from the northern to the most southern parts of India, the mountains of Sylhet, Chittagong, Penang, and Taong Dong, and from moderate elevations (*Q. incana*, or ban of the hill people) to the limits of forest (*Q. semecarpifolia*, or khursoo.) The last species varies much in appearance, and as this is likewise observed in others, the number of Himalayan oaks at present enumerated, is probably excessive. The oaks in Kumaon, are of three species, the leaves of all being lance-shaped, more or less serrated, and some exactly like holly. They are the Mourroo, and the Khursoo, which grow to 12,800 feet, and the Ban which disappears at 8,000.

Some of the other trees are rhododendron, maple, plane, ash, hazel, horse-chestnut, rose, mountain-ash, and juniper. Oaks are found in the Himalaya, Nepal, Kumaon and Sylhet, and in many parts of the S. E. of Asia. All travellers in the Himalayas, testify to the abundance of their oaks. The people employed by Dr. Wallich gathered a considerable number of species, and Dr. Royle assures us that they are found from moderate elevations up to the limits of trees. He adds that they are found from the northern to the most southern parts, on the mountains of Sylhet, and in Chittagong, Penang, and Taong Dong and from moderate elevations, as in the case of *Q. incana*—from 5,000 to 7,000 feet,—to the limits of the forest where *Q. semecarpifolia* disappears; but at 10,000 and 12,000 feet, on the southern face of the Himalaya, as at Choor, Kedarkanta and Changshel, the *Quercus semecarpifolia* generally forms the forests at their highest limits, though other species of *Quercus*

QUERCUS.

are found below, with *Taxus*, *Betula*, *Deodara*, *Pinus excelsa*, and *morinda*. Dr. Hooker tells us that oaks grow in the valleys of the eastern Himalaya, in eastern Bengal, and in the Malay peninsula. No oak nor chestnut, he says, ascends above 9,000 feet in the interior of Sikkim, where they are replaced by a species of hazel (*Corylus*); in the north Himalaya, on the other hand, an oak (*Quercus semecarpifolia*) is amongst the most alpine trees, and the nut is a different species, more resembling the European. On the outer Sikkim ranges, oaks (*Q. annulata*?) ascend to 10,000 feet, and there is no hazel. It is not generally known, he adds, that oaks are often very tropical plants; not only abounding at low elevations in the mountains, but descending in abundance to the level of the sea. Though almost unknown in Ceylon, the Peninsula of India, tropical Africa, or South America, they abound in the hot valleys of the Eastern Himalaya, East Bengal, Malay Peninsula, and India islands; where, perhaps, more species grow than in any other part of the world. Such facts as this, he remarks, disturb our preconceived notions of the geographical distribution of the most familiar tribes of plants, and throw great doubt on the conclusions which fossil plants are supposed to indicate. The evergreen oaks observed by Mr. Fortune in the Himalayas, were *Quercus dilatata* and *Q. semecarpifolia*: also, the *Quercus sclerophylla* and *Q. inversa*, the last two with large and glossy leaves, not unlike the Portugal laurel at a distance. Captain Gerard tells us of three species of oak in Kunawar the leaves of all being lance shaped, more or less serrated, and some exactly like holly. They are the Monroo and the Khursoo which grow at 12,800 feet, and the Ban (*Q. incana*), which disappears at 8,000 feet. Major Benson, writing in British Burmah, remarks that *Quercus fenestrata*, *Quercus turbinata*, and *Quercus velutina*, produce good, durable, timber, resembling that of the *Dillenia*s in density and elasticity, though the trees do not grow of that size to make the timber of the same value as the *Dillenia*s, "Zinbuin." And the *Dillenia*s are not only valuable as timber trees; but for ornamental purposes. Dr. Mason tells us that Dr. Wallich found seven different species of oak growing in Burmah and on the Tenasserim Coast, all of them yielding useful timber, though inferior to the English oak, and 23 species are named in Japan, but many of the Javanese kinds, appear to be peculiar to the Indian Archipelago, or only occur near the south eastern angle of Asia, where they reach their most southern limits, being scarcely known in a wild state, in the southern hemisphere. Dr. Wight gives, in his *Icones*, *Quercus acuminata*; *armata*; *castanicaarpa*; *fenestrata*; *ferox*; *lanceæfolia*, *lappacea*; *semi-*

QUERCUS DILATATA.

Gerard's Account of Koonawur*, p. 67.

QUERCUS, Species.

Reen Wood, ANGLO-PUSHTOO?

An evergreen oak, bearing acorns, growing in the Mehra forest, near Abbottabad, Hazara. It is a large spreading tree, and supposed to be the American oak.—*Cat. Cat. Ex.* 1862.

QUERCUS ACUMINATA.

Hunnee, HIND.

QUERCUS AMHERSTIANA, Wall.

Tirbbee, BURM.

A large tree of Martaban, used in boat-building. It grows also in Tenasserim and Burmah and affords useful timber though inferior to English oak.—*Dr. Mason*.

QUERCUS ANNULATA.

Bani, KOTGARH. | Ban-kahoo, PUSHTOO.
Ban-kan, PUSHTOO. | Hunne Phuliat, Funiat,,

The ring cupped oak grows in the outer ranges of the Sikkim Himalayas, to the height of 10,000 feet.

QUERCUS BALLOTA, W.

Barbary oak, ENG. | Buloot-ul-mulk, PERS.
Shah-buloot, PERS.

This is probably the tree described in Persian works as Shah buloot and Buloot ul mulk, and mentioned by Theophr. It is a native of Spain and Greece. The acorns of *Q. incana* are sold in the bazaars as a medicine, under the name of Buloot. Roxburgh says that a species of oak, *Quercus fenestrata*, is a native of the mountains in the vicinity of Sylhet; on the Tenasserim coast the same species grows indigenous not fifty feet above the level of the sea.—*O'Shaughnessy*, p. 607; *Mason*.

QUERCUS CHINENSIS, the Chinese Oak, is a beautiful species found in mountainous places in China, and is said to have exactly the habit and appearance of a Spanish chestnut.—*Eng. Cyc.*, *Royle's Ill.*

QUERCUS DILATATA.

Q. taxiflora, Here'u, CHAMBA HILLS.
Mohru, Marghand, KANAWAR.
Barungi, HAZARA. Chora, KAGHAN,
Bar, MURREE HILLS.

This is a fine evergreen oak of the Himalayas, found in the Sutlej valley between Rampur and Sungham at an elevation of 6,000 to 9,000 feet. It yields an excellent heavy wood. The timbers of all the oaks are good, hard, and so heavy, that they will not float. *Quercus dilatata* ap-

pears to be the species most esteemed.—*Fortune*; *Oleghorn's Punjab Report*, p. 64.

QUERCUS FENESTRATA, Roxb. Grows in the Khassia hills, is a native of the mountains in the vicinity of Sylhet, and grows in Burmah and the Tenasserim provinces not fifty feet above the level of the sea. It affords useful timbers.

QUERCUS FLORIBUNDA.

Barcha, HIND.

This is found in the Sutlej valley between Rampur and Sungnam at an elevation of 9,000 feet.—*Oleghorn's Punjab Report*, p. 64.

Reen or Reenj; Reeng.		Dharoo; Deroo.	
Hoary oak.		Vari, Salt Range.	
Ireen.		Kharshoo, Shundar.	
Maroo.		Dhagun-ban.	

This is a plant of Kaghan, and is found in the Sutlej valley between Rampur and Sungnam at an elevation of 5,000 to 8,000 feet, it is the principal firewood in the hill stations. Much of the fuel and charcoal is made of this oak. The English residents at Dhurmsala use this timber for beams and rafters. The tree attains its full size in 100 years, and a very old tree yields a log or trunk to first branch from 16 to 20 feet in length (?), and 6 feet in circumference; wood of a red colour, hard, tough and heavy, coarse grained, liable to warp, and to decay if exposed to wet; useful for building purposes; leaves given as fodder to cattle. Its acorns, Balut sil supari are sold in the bazaars of the N. W. Provinces under the name of Shah Baloot. Used for indigestion, diarrhœa and asthma. Recommended for chronic diarrhœa in children, after burying in the earth to remove their bitter principle, then washing and grinding.—*Oleghorn's Punjab Report*, pp. 63, 4; *Balfour*, p. 205; *Mr. Barnes' Kangra Settlement Report*, para. 147, *Commr. Jullundhur*; *Powell's Hand-book*, Vol. i, p. 385.

Gall oak; Gallnut oak	ENG.		

Asia Minor, Armenia and Kurdistan, a shrub 4 to 6 feet high, when punctured by a cyneps an astringent juice exudes, which becomes the gall nuts of commerce.—*O'Shaughnessy*, p. 608.

QUERCUS INVERSA, an ever-green oak, of the Himalayas, with large glossy leaves, not unlike the Portugal laurel.—*Fortune*.

QUERCUS LANCEAFOLIA, Roxb. A tree of the Garrow hills and Assam. Wood light-

coloured like the English oak but harder and reckoned, where it grows, one of the most durable timbers.—*Voigt*; *Roxb. Fl. Ind.*, p. 634.

QUERCUS LANATA.

Reang,

HIND. | Q. Lanuginosa.

In many localities in Kumaon this species takes the place and name of *Quercus incana*.

QUERCUS LAPPACEA, Roxb. A tree of the Khassya mountains. Wood strong, in colour like that of the common oak, but hard and more close grained.—*Voigt*; *Roxb. Fl. Ind.*

QUERCUS LAXIFLORA.

Barungi, HIND.

A large tree, wood used in house-building.

QUERCUS LUCIDA and *Q. muricata, Roxb.* are Penang trees.

QUERCUS PEDUNCULATA, its bark is used in medicine.—*Ben. Phar.*, p. 217.

QUERCUS PRINODES, Linn.

Quercus serrata, Roxb. | Shingra, HIND.

A tree of the Garrow hills, yields a useful timber.—*Voigt, Roxb. Fl. Ind.*

QUERCUS SCLEROPHYLLA, an ever-green oak of the Himalayas, with large glossy leaves, not unlike the Portugal laurel at a distance.—*Fortune*.

QUERCUS SEMECARPIFOLIA, Wall.

Alpine oak,	ENG.	Khareu,	PANJ.
Bauchur,	PANJ.	Kharshu,	"
Jaugal	"	Kharao,	"
Parungi,			

Seldom grows below 8,000 feet, and ascends above the range of pines. It is one of the most alpine trees of the north Himalaya. It is an ever-green species. Its acorns are named Shah baloot. It is found in the Sutlej valley between Rampur and Sungnam at an elevation of 9,000 to 12,000 feet. It is a magnificent tree, and its timber much esteemed by the natives. Wood white, and heavy; subject to insects and liable to warp: used for making charcoal, and by zemindars for ordinary house-building purposes; produces also good and large timber.—*Royle*; *Oleghorn's Punjab Report*, p. 64; *M. R. Barnes' Kangra Settlement Report*, para. 14, and *Balfour*, p. 204.

QUERCUS SEMISERRATA, Roxb.

Thit-kya, BURM.

A tree of British Burmah. Wood used for plugs or pins, to join together the three pieces which compose the body of a Burmese cart-wheel.—*Cal. Cat. Ev.* 1862.

QUERCUS SERRATA.

Shingra, DUK.

These trees are only found in the hill stations, where they have been grown from seed by private individuals. At Mahableshtar, a few plants have been grown, more resembling a shrub than a tree.—*Riddell*.

QUERCUS SPICATA, Buch. A tree of

Nepal, of the Garrow hills, the Khassya mountains and Chittagong. Wood lighter colored than English oak, but equally close-grained and apparently as strong.—*Voigt*.

QUERCUS TIRBBÆ.

Tha baik, BURM.

Grows in Burmah and the Tenasserim provinces. It affords useful timber though inferior to English oak.—*Mason*.

QUERCUS TURBINATA, grows in Chittagong : in Burmah, it affords useful timber though inferior to English oak. Roxburgh says it is only used for fuel.—*Roxb.*, p. 636.

QUERCUS VELUTINA.

Tha ghau, BURM.

Grows in Burmah and the Tenasserim provinces. It affords useful timber though inferior to English oak.

QUERQUEDULA, the Teal genus of birds, comprising as under :

grecca, *Lin.*, common teal.
circia, *L.*, blue winged ,
glocitans, *Dallas*, clucking teal.
javana, *Budd*, Java teal.
manillensis, *Gm.*, Manilla teal.
numeralis, *Mull.*, Eastern teal.

QUESO, Sp. Cheese.

QUETTA. The valley of Quetta, or Shawl, is situated in 67° E. long., and 30° to 30° 20, N. lat. It is about 15 or 20 miles in length, and from 4 to 6 in breadth. It is bounded to the westward by the Chah'l Tan range, having a strike of S. S. W. by N. N. E. Quetta is about 5,900 feet above the sea. The mountainous table-land of Beluchistan extends from Cape Monze, on the south to the Affghan mountains north of Quetta, or from 25° to 30° 40' N. latitude, and is consequently about 340 miles in length. In breadth it extends from the level plains of Kutchee eastward, to Nooshky on the borders of the Seistan desert eastward, extending thus about 150 miles. But its breadth is by no means uniform : widest about the centre, it gradually narrows southward, until, at Cape Monze it is only a few miles broad.

QUICKLIME.

Ahuk,	ARAB.	Iswet,	RUS.
Chaux,	FR.	Churna,	SANS.
Walk,	GER.	Honnoo,	SINGH.

Nureh,	PERS.		

The common method of obtaining quick lime is by the process of burning, in which limestone mixed with wood, coal, or charcoal, is exposed to a strong heat ; in this way the carbonic acid is expelled, and the product called quick lime is the result. It is white, of a pale gray tint, opaque, inodorous, and its taste acrid and alkaline. When water is poured upon

quick lime it heats, crackles, swells, and a bulky white powder is obtained, called slaked lime. Lime is used as a manure and as an ingredient in mortar. In several metallurgic processes, it is used as a cheap and powerful flux ; it is also extensively employed in soap-making, leather-dressing, dyeing, and medicine, besides many other purposes in common life and the arts. In oriental commerce, the term Chunam is applied to quick-lime made from calcined shells.—*Faulkner*. See Chunam.

QUICKSILVER, is said to occur about 6 miles from Colombo and Trincomallee. While some excavations were making in the laterite on the sea-face of the fortress of Cannanore, in 1857, globules of fluid mercury were found in the cells of the laterite, giving the appearance of its being of natural occurrence.—*As. Ann. Reg.* 1799 ; *Joinville's MSS.* See Mercury.

The Quince is a native of the south of Europe and grows in Persia : its fruit is stewed and it makes good marmelade.

There are three kinds of quinces (1), Shakkar, or sweet ; (2), Tursha, sour ; (3), Miyana, or middling. The first is eaten fresh and has a delicious perfume ; the second is dried, candied, &c., the seeds of all are demulcent,

QUISQUALIS INDICA

and used in sherbets and as a cooling drink in fever.—*Powell*; *Hogg's Vegetable Kingdom*.

QUINCE SEED.

Behdana, Hub-ul-suf-furgul,	ARAB.	Quittenkornor, Behdana,	GR. GUZ., HIND., PERS., TAM.
Semen de Coig, Quincunx,	FR.	Melacotogna,	IT.

These are oval, acute seeds, plain at one side, convex at the other, often triangular, truncated at one end, of iron colour externally, and internally white. They abound in mucilage, and are an article of the materia medica. This seed constitutes an important article of commerce in India, being highly valued as a demulcent tonic, and restorative remedy by the Hindoos and Mahomedans all over the East. They are imported into Bombay and Calcutta from the Persian Gulf; and into Northern India they are brought from Cabul and Cashmere.—*Faulkner*.

QUINGAMBO of West Indies, *Abelmoschus esculentus*, *W. & A.*

QUINQUEGENTES. See Semitic races.

QUINQUINO, also called myrrh seed or the white balsam, is prepared from the balsam of Peru tree, *Myrospermum peruvianum* and from *M. pubescens*.

QUINQUILLERIA, *Sp. Hardware*.

QUINTUS CURTIUS, see Kelat, Khuzistan or Arabistan.

QUISQUALIS INDICA, *Linn.*

Da-way-hmaing, *Burm.*

Chinese Honey Suckle. | Rangoon creeper.

A scandent shrub, with beautiful flowers of various colours, from white to orange and deep-red; has a very powerful perfume towards night. It grows from layers, or seed, but the latter are very difficult to find. In Tenasserim this elegant scandent shrub is seen trailing its long arms around our bowers and verandahs, buried in thick lively foliage, and gracefully flinging out its thousands of sweet-scented flowers which change their tint from white to rose, and with the clouds at sunset, deepen into richest crimson. The flowers are scarlet outside and yellowish white within, and hang in large clusters,

QUTUB SHAHI.

very useful in covering walls or trellis work, the scent at night is unpleasant to some persons. It is a very common plant in the gardens of the Dekhan and may be raised from seed or layers.—*Jaffrey*; *Mason*; *Riddell*.

QUITTENKORNER, *GER.* Quince seed.

QUIVER. Throughout South Eastern Asia, the bow and arrow, has almost disappeared, the only people using it constantly in war and for the hunt, being the Andamaners—but at the annual "langar" of the nizam of Hyderabad, there are still to be seen a few soldiers in the procession, armed with bows. Recently too in the beginning of 1870, the editor met a small body of men, seemingly on some predatory excursion, one of whom was armed with the bow and a quiver full of arrows. In April 1863, a few days before the editor arrived at the Andamans, a British sailor was killed by an Andamaner who was captured.

QULUM, *AR.*, the pen of record.

QULUNDUR, *PERS.*, a class of fuqcers or devotees.

QUOIN HILL, called Jibl Mia Ally, at the Straits of Babel Mandeb, is 865 feet above the sea.

QUOIRENG, the Quoireng tribe, has a language distinct from those of the Songboo and Poeeeron but with a great similarity in all other respects. They inhabit all the hills north of the Koupoee, between the high range that skirts the valley of Munnipore and the Burak, as far as the Angamee tribe, from whose aggression they have suffered much. From these aggressions and their own feuds, they have much decreased in number, but are still a very considerable tribe, possessed of much energy which develops itself in trade with the Angamee and the British frontier district, see Natunas islands.

QUOI-TOTA-KURA, *TEL.* *Amarantus tristis*.

QUTB-UL-MULK, a sovereign of Golconda, near Hyderabad in the Dekhan.

QUTUB SHAHI, a dynasty of Golconda, see Hyderabad in the Dekhan.

R

R, the 18th letter of the English language is a semi-vowel and a liquid, and in the English tongue has two distinct sounds, the one, as in ran, free, morose, and when at the beginning of words or syllables, produced by an expulsion of vocalized breath, the other sound when followed by a consonant, and when at the end of words, is formed by a vibration of the tongue near the root, as in her, ford, startling. In words derived from the Greek language, the letter h is usually written after r, as in rheumatic, rhapsody, rhetoric. R has various modifications in the languages of the East Indies. It is changeable into l, and the Chinese who cannot pronounce r, always use l in its place. Usually it has the sound of r in round, run, ruin. In the Hindustani it has a rough sound as r or rh, which alternate with the cerebral letters d, and db, and in Telugoo, Karnatica and Tamil, it has a harsher sound. The r of the Tamil and r of the Malayalam are in some respects identical, and when doubled as rr, have the sound of tt. The Sanscrit vowel sound ri is modified in the peninsula of India into ru.

RA A god of the ancient Egyptians, was worshipped separately from Osiris.

RAABEUH-KHEYL. See Khyber.

RAAMAH of Ezekiel xxvii. 21 to 23, is the modern Reima.

RA-GANGADEVA. See Inscriptions.

RA SRI BAHMA. See Inscriptions.

RA SRI MAHA DITYA. See Inscriptions.

RAB. **AB**. **HIND**. **PERS**. Juice; jelly; pronounced rāb.

RAB. **HIND**. *Arum colocasia*; *Colocasia antiquorum*.

RABAN. **HIND**. *Chionanthus*, *sp. Schott*.

RABAN. **HIND**. A Panjab tree of moderate size; wood white, soft, light; used by zemindars for their houses and implements. Bark used medicinally; leaves used for fodder.—*Powell's Handbook*, Vol. 1, p. 542.

RABBA. See *Sterculia acuminata*.

RABBAN. *A'tha* is a Turkish word, according to Odoric, signifying father. Taking it in connection with Rabban, it may be noted that in 1288 there came on a mission from the Ilkhan of Persia to the court of France a certain Nestorian bishop, who is termed by the chroniclers Rabban Ata.—*Yule, Cathay*, I, p. 118.

RABBIT. *Lepus ouniculus*.

RA-BER, on the road, properly rah-bur, corrupted by the Pindarri to labour, the designation of their forays.—*Tod's Rajasthan*, Vol. I, p. 19.

RABHAS. See India.

RABI. **HIND**, also written Rabbi and called by the people "Hari," the spring harvest, crops sown in winter and out by Har, early summer. The spring, or Rabi, crop is sown after the rains, and reaped at the commencement of the hot weather.

RAB-I-SUS, also rab-us-aus, **HIND**. *Glycirrhiza triphylla*, liquorice, literally sweet juice.

RABNADAB ISLAND, the southern extremity of which is in lat. 21° 50' N., is a large island, 18 or 20 miles to the eastward of the Hooringattah entrance of the Ganges.

RABOK. **MALAY**. Fireworks.

RACACHON or *Racachont*. **ARAB**. A substitute for chocolate; a preparation of roasted acorns, powdered with sugar and aromatics.—*Simmond's Dict*.

RACE, a term used by ethnologists to distinguish the people from different branches of the human family. The word is not in use amongst Europeans in the East Indies, by whom the people of the country are collectively called natives, and their several races are designated castes. But there is no doubt that the brahmin, the Kshetrya, the Rajput, the Vesya, the Sudra hindu, the Moghul, Syed, Persian and Pathan mahomedan, and the Burman, Karen, Mon, Malay, Papuan, and Arafura, the Jat, the Baluch, the Brahui, the Parsee, and the Bengali are all of different races, as also, are many of the non Aryan peoples of India, the Pariah or Dher or Mhar, the Chaakeli, Chuckler or Madhara, the Dom and hundreds more. This subject has been largely disposed of under the word India. Bishop Heber early observed that the people of the mountains, and of all the hilly country adjoining Burdwan, are a race distinct from those of the plain, in features, language, civilization, and religion.

The Khatree is a race numerous in the Upper Punjab, and about Delhi and Hurdwar, and found along the Ganges as far as Benares and Patna. They divide themselves into three principal classes; I. the Charjati or four clans, viz.; Seth, Marhota, Khunna and Kuppoor. II. Bara jati, viz. Chopra, Talwar, Tunnuhu, Seigul, Kukker, Mehta, &c. III. Hawun-jai or fifty-two clans, amongst whom are Bundari, Meindrao, Sehti, Suri, Sani, Unnud, Buhseen, Sohdi, Behdi, Teehun, Bhulleh, &c. The Proopshoo people are hindoos of a different race from the Bhot, and winter and summer live in their black tents with their flocks and herds of sheep, goats and yaks. They are very ugly, with Tartar faces, and the men let their coarse black hair hang in one pig tail behind.

The population of all the islands of the Pacific group is presumed to date from Oceanian migration, which has been laid down in the following order—Malayan, Protonesian, Papuan Polynesian.

A well-known writer, classes the inhabitants of the Archipelago into two great races, totally different in their physical aspect and in their moral character. He says, the Polynesian race extend from Marianna to Easter Island and from Hawaii to New Zealand, with no greater variety in the language than is to be met with in European tongues derived from the same source. The second race are distinguished by the usual Ethiopian features, and occupy New Holland, New Guinea, New Caledonia, and the Fiji. The physical conformation of the Papuan, and particularly the squareness of his head, distinguishes him from the African negro. That writer assumes that one island has supplied another with population, based upon the principle of contiguity, and deduces therefrom that Torres Straits, being the narrowest portion of the ocean which separates Australia from New Guinea, constitutes a reason for deriving the Australian source from the Papuans.

It is difficult to define the extent of early occupancy, and to determine where this migration ceased on the Australian continent, since there are physical evidences, as well as other indications of a strong character, which denote that Tasmania and Australia consisted formerly of an undivided terra firma.

The Papuan race are clearly either from the Moluccas or an adjoining island, where the negro characteristics are shown to have been more strongly developed than those to be met with around the continent of New Holland; and although the island of New Guinea, from its situation and importance, has enjoyed the advantages of certain civilizing influences at a comparatively early period, it has nevertheless retained the strongest features of its settlement throughout a varied intermixture. The natives of New Guinea have, almost generally, the woolly head, sometimes frizzled, and occasionally in pipe-like knots, the thick lips and squat noses, which indicate their negro connection, while their colour ranges from the sallow hue of the Sandwich Islander to the dark copper of the Borneese. The face is suggestive of the Mongol type, being square and angular; and in many parts of the island of New Guinea the obliquity of vision common to the Chinese is apparent. Recent investigations would seem to denote also that they are frequently distinguished by a Jewish cast of features; so that, instead of their presenting indications of a pure nation, as well as the distinctive type of a great race, there is abundant evidence to the contrary. Coming, in all probability, from one of the small western

islands in the route from the north-west or the Moluccas (originally peopled from the Philippines), the Papuan race are found to spread over a large area and extend round the Caroline Islands. Blakeland states that the geographical boundary of the Papuan is coincident with the north-west monsoon, which may be described as extending from the Equator to 10° or 15° north latitude, and in longitude from Sumatra to the Fiji Islands, from which circumstance and their ignorance in navigation the inference is that they have travelled from the west into the Pacific only so far as the prevailing winds allowed. If Australia were an open country, accessible at the time of the settlement of New Guinea, it is more than probable the Papuan would have peopled it themselves; the same facilities which enabled the natives of Sumatra and Java and other islands of the Eastern Archipelago to visit the islands of the north and north-eastern Continent, where evidence of antiquity exists—also afforded the opportunity of crossing the coral reefs of Torres Straits, and examining the mainland of Terra Australis. It would be an unsound hypothesis which assumes either the entire omission of so large a continent, or a failure of occupation consequent upon the sterility and unpromising character of its coast approaches. The resemblance of the Australians to some of the tribes inhabiting the southernmost settlements of the Arafura Sea, and the proximate intermediate islands of Torres Straits, is doubtless owing to the inhabitants of the great islands, and of the group of settlements in close contiguity to the coast, being of coeval distribution. The Australians possess the wide-spreading nose, receding forehead, and rapid eye of the African, the thin and muscular limbs of the Zulu, and the long silky hair of the Western Malay, with not a little of the latter's skill and daring—and to these types respectively the natives of north and north-west Australia approach nearer than to any other. In many features of their superstitions they assimilate to the north American Indians, and to some of the tribes of the Pacific, strongly resembling the latter in their interments, and in the practice of piercing the septum of the nose. In physical appearance the Australian is prepossessing. The eye is full and expressive, the head and body erect, and the chest well thrown forward. All the men have thick beards and hair. This is a distinctive feature, and is not shared generally by the Mongolian, Negro, Malay, or the natives of the Celebes, the latter of whom may be presumed to have enjoyed facilities for effecting an intermixture with the Australians.

Native Australian women are met with whose hair, in spite of the abominable practices to which it is commonly subjected, is compara-

tively soft, the head being covered with a profusion of loose natural curls.

The instruments of warfare in general use by the two contiguous races vary no less than their respective customs, language, and physique. The most remarkable weapon of the Australian is entirely unknown to the Papuan, who, in fighting, use the bow and arrow. Although an advance towards civilization is claimed for the Papuan, it is observable only where the natives have been susceptible of impressions in their early intercourse with the Malays and traders of Java, from whom a great many of their customs are copied, and more recently by contact with the Dutch, who have settlements on the different islands. This evidence tends to throw doubts on Australian identity with the Papuans, as we have the fact of entirely different races inhabiting the two large islands, and separated by a distance of only 140 miles. The facilities of intercourse, rendered at all times difficult by the dangers and intricacy of the 'Straits,' have been further lessened by the hostility of the Coast tribes, so that the trafficking with the native Australians and intermixture has been confined to those people, who, aided by a superior skill in navigation and also in the construction of their vessels, have enjoyed the advantage of the trade winds. Had the northern migration penetrated beyond those intermediate islands lying between Papua and Australia, there would have been ample indications of the connection in both races. Sturt thinks that it is difficult to determine, 'from what race the Australian sprang, for there is not one of the great families into which the human race has been divided with which they may be properly classed.' Strzelecki, who mixed among the Australian tribes of the greatest diversity, says,—'In his physical appearance he does not exhibit any features by which his race could be classed or identified with any of the generally known divisions of mankind.' Perhaps the most practical account is that given by Wilkes, who in his American exploring expedition, says,—'They differ from any other race of men in features, complex habits, and language, their colour and features assimilate them to the African type, their long black silky hair has a resemblance to the Malay, their language approximates to the American Indians, while there is much in their physical traits, manners, and customs to which no analogy can be traced in any other people; their most striking distinction is the hair.'

One Professor, whose experience and attainments entitle his opinion to considerable respect, infers from recent discoveries a strong resemblance between the original inhabitants of a small European Cantonment and the Allurian.

The large extent of Australian coast land which offers itself to the seaboard of China, embracing without doubt the locale of the earlier settlements, has been advanced in favour of the theory that the occupation of Australia, together with the principal settlements as far east as New Guinea, resulted from one common migration, the parent source being the Chinese Seas. It is well known, from the period of the earliest discovery by Europeans, that the Chinese, the Malay, and the Celebians visited the south-eastern islands of the Indian Ocean, and had their stations on the Australian coast, trading with the inhabitants, and conveying from thence cargoes of trepang, shells, &c.; and we have strong indications of the Malay influence throughout the different parts of the Northern Continent pervading even some of the native customs. The only evidence presented in support of the above theory, however, is that afforded by the discovery recently of a tribe on the Balonne river, to the north-westward of the Upper Warrego, the head of both sexes being quite bald. In other respects they share the characteristics of the Mongolian. These people speak a different dialect to the neighbouring tribes, who hold no intercourse with them, regarding them in fact with a degree of superstitious awe. The expression of colour, a most important element of race, and which is uniform throughout the island, forbids the supposition of any great intermixture with a lighter type.

The nomadic existence and habits of the Australians have caused a union of diverse sections of the native race distributed over the continent, producing tribes speaking a different language, and presenting finer specimens of men. The north-east natives, for instance, are the most warlike and of superior physical power; while those on the north-west coast are the most ingenious, maintain a purer idiom, and, according to the latest explorations, are more readily susceptible of civilizing influences. An immediate local intermixture has invariably resulted in a degenerate descent, and these results have been painfully perceptible in the settled districts, where the worst influences of civilization have wrought their effect on the physical character.

The north-west coast of Australia being the most accessible to the Island of Timor, favours the hypothesis that it was by these people the great island was first occupied. In the language there is about the same variety and intermixture of Malay, while we have an uninterrupted line of islands as stepping stones, almost direct to the Timor group, from the great Malayan source—Sumatra. No tradition of settlement exists amongst the Australians, but on the eastern and north-

eastern coasts natives are found who evince a higher and more intelligent organization, who are also in the possession of tastefully finished and skilfully constructed canoes, and who evidently enjoy hereditary laws and customs. Ancient weapons are known to have been used among them, and we have a knowledge of figures and sketches, some apparently of great age being outlined upon the rocks along the northern coast. Grey discovered several curious figures in caves, and the outline of a man's hand boldly defined on a rock in the Glenelg river, besides tombs of ancient appearance. There are also numerous native drawings and rude impressions of men and animals along the coast of the Gulf of Carpentaria, of Finner's and Depuch's islands and near Sydney, all indicating native origin and settlement to be of a remote period. Further evidence in favour of the antiquity of the Australian race is afforded by recent discoveries made in Victoria, the latest of which is that of the bodies of three aboriginals petrified into solid marble, the veins, muscles, &c. of which could be distinctly traced through what is now a group of stone blocks, perfectly sound and whole. They were found in a sitting posture near the surface, together with an ancient stone weapon, so that the present custom of burying the dead is thus shown to have been practised at least many centuries ago, for the situation of their deposit, and the condition in which they were found, preclude the idea of these remains having been buried otherwise than during the recent period of formation. Occasionally, traces of large kilns or mounds, composed of burnt clay, stones, and debris, are to be met with, overgrown with timber and nearly buried, on which they cooked their repasts of wild animals; but neither these ancient cairns, nor the fossiliferous remains of aboriginals which have been exhumed at different periods, illumine the obscurity which surrounds the race of Australians.

In the border districts of British India, into which intruding races have come, the distinctions of races are very marked. In the vicinity of Darjeling are mahomedan and hindu natives from the plains of India; the Bhootin from Bhootan, Thibet and Sikkim, the Lepcha and the Mechi. The Lepcha have no religious or race distinctions, but they speak of themselves as belonging to the following clans, viz. :—

Burphoong phoocho.	Sundyang.	Lucksom.
Udding phoocho.	Sugoot.	Therim.
Thurjokh	Tungyeld.	Songme.

Captain J. D. Herbert observes that at his first interview with the Lepcha, he saw that they were the same people whom he had met with at Nilang, at Jahnnabbi, at Shipohi on

the Suttlej, in Hangrang, and at Lari in Ladak. They are, in fact, the people who have been erroneously called Chinese Tartars and are in reality of the same race as the Thibetans, being a family of the great division of Eleuth Tartars or Kalmuck.

The people of Nepal arrange themselves into many sections, viz. :—

Goorroong ..	rear sheep.	Moormia	} Principally cultivators
Gallia.....	rear buffaloes.	Yakha.	
Kami....	Blacksmith.	Mungar	
Sarki....	Tanners.	Brahmin.	
Newad ..	Shopkeepers.	Khumbhu	
Domai.....	Tailors	Nimbhoo.	

In the plains of the Darjeling district, the Rajbansi and Bengali are in equal numbers. The Rajbansi are Koch or Cooch of the same descent as the raja of Cooch Behar. Hence they call themselves Raj Bansi.

The Mechi inhabit that portion of the Terai which lies under the hills. They are migratory, live by cultivating the virgin soil; they have no caste.

The various tribes inhabiting the Indian desert and the valley of the Indus would alone form an ample subject of investigation. In the earlier ages there were two chief Rajput races, in Hindustan, viz., the Soorya and the Chandra, to which were added the four Agnicula; in all six. The other races were subdivisions of the Soorya and Chandra, or the Sacha of Indo-Scythic origin, who before the mahomedan era found no difficulty in obtaining a place, though a low one amongst the thirty-six regal races of Rajasthan.

The Ganges valley seems to have been peopled by several races, long before the Aryan hindus arrived there, and all the conquerors who have entered India from the north-west have striven to occupy the fertile valley of this great river. Hindu poets have celebrated its praises in a multitude of songs; the river is fabled in their mythology to be the goddess Ganga; they long to see it, to bathe in its waters and be purified from their sins, and at last to die on its banks, or to have their bones conveyed to it from the most southern parts of India. No hindu raises such a question as in 2nd Kings v. 12, for the Ganges is recognized as the most efficacious of all the hindu sacred rivers. On its banks have dwelt the chief of the religious reformers, whom India has seen. Its valley was the cradle of buddhism; which, from its rise in the sixth century before Christ, gradually spread over the whole of India, was extended by Asoka to Kashmir and Kabul shortly after Alexander's invasion, and now prevails amongst 222 millions of men. Numerous dynasties have ruled there. The Andra race was in power in the Gangetic province of India, about the

beginning of the christian era, but the most enduring was the great Chetrya family that long ruled at Indraprestha, and terminated with Prithi-raj in A. D. 1300. Near the Indus, the Soda, the Cat'hi and the Mallani, afford, in history, position, and nominal remembrance, grounds for inferring that they are the descendants of the Sogdi, Cat'hi, and Malli, who opposed the Macedonian in his passage down the Indus; swarms of Geta or Yuti, have assumed the general title of Baloch, or retain the ancient specific name of Noomri; while others, in that of Zj'but, preserve almost the primitive appellation. There are remains of the Johya and Dahya, as well as of the Geta or Jit, and Hun, who hold places amongst the thirty-six royal races of ancient India. though these, with the Baraha and the Lohana, tribes who swarmed a few centuries ago in the Punjab, are now only to be discerned in small numbers in the Marust'hali or "the region of death," which has even preserved the illustrious name of Kaorwa, Krishna's foe in the Maha-Bharata. The Sebrái, or great robber of the western desert, the enemy of all society is also there, and the hindu Bhatti, Rahtor, Joda, Chohan, Mallani, Kaorwá, Johya, Sooltano, Lohana, Arorah, Khoomra, Sindil, Maisuri, Vishnúvi, Jakhur, Shíag or Ashíag, and Pooniah.

Of the mahomedan tribes there are two, Kulora and Sebrái, concerning whose origin doubt exists, and the Zjut; Rajur; Oomra; Soomra; Mair or Mér; Mór, or Mohor; Baloch; Loomra or Looka; Sumaicha; Mangulia; Baggréah; Dahya; Johya; Kairoóé; Jangurea; Oondur; Berowee; Bawurf; Tawuri; Chrendea; Khossa; Sudani and Lohana are nyád, or proselytes chiefly from Rajpoot or other hindu tribes.

The Jat does not occupy lower Sind and they are not found in Guzerat. The Jat is, however, the prevailing population in all upper Sind and their tongue is the language of the country. They were once the aristocracy of the land, but latterly have been dominated over by other races, and thus have lost somewhat of their position as the higher classes of the society. In the south and west of the Punjab, too, they have long been subject to mahomedan rulers. But latterly, as the Sikh, they became rulers of the whole Punjab and of the country beyond as far as the upper Jumna, in all which territories they are still in every way the dominant population.

The earliest political change to which we can go back in the history of the Peninsula is the expedition of Rama into the forests of Dandakaranya, an event coeval with the hero worship of the Pandava, and the myths of the Maha-Bharata and Rámáyana. The brahminical crusade of which Rama was the leader, scattered

the aboriginal races styled Rakshasa or demons driving some into the mountain and forest retreats, where we still find them living in barbarous freedom, and reducing others to the state of agrarian slavery in which we now see the Pariah, Puller, Cherumar, and other helot races existing in the plains. Each province has its peculiar race of helots. Each range of mountains and every tract of forests its own tribes of wild savages either wholly independent, or partially subject to their more civilized neighbours in the open country. From the Pahari (undoubtedly a remnant of the great Tamulian or Southern family) of the Rajmahal Hills on the banks of the Ganges, through the extensive regions of Gondwana, embracing the Khond, Sourah and Chencher of the Eastern Ghats, the Yanadi, Irular, Curambar, (at one period apparently the most numerous and powerful race of all,) in the midland provinces,—to the Bedar, Maravar, Kallar and other tribes, comprised under the general term of Malayali, or mountaineers in the south, we find an infinite succession of races professing customs and speaking languages differing, and, in many instances, distinct, from those of the modern hindus. The same peculiarities may be observed in several of the nomade castes roving over the plains in the more civilized portions of the country, such as the Korchewar, Woddewar, Yerkelwar and Pardi, &c. A careful and systematic investigation of these remains of the former population, of their customs and religious observances, &c., with the preparation of copious vocabularies of the peculiar dialects or jargons in use amongst them, are among the most important objects to which attention should be directed, because, the study of these outcast tribes, of their language, manners and customs, form nearly the only available source from which we can glean a knowledge of the earlier inhabitants of India.

Races need to be considered in their tribal, professional and religious denominations, subdivisions or zat. Mr. Hodgson's view of studying the ethnic relations of these races alike by means of their languages and of their physical structure is shared by Mr. Logan, who mentions Singapore as affording unequalled opportunities for the study. And doubtless, Singapore possesses such advantages; but, on the pier of Rangoon, as the Mail Steamers arrive, is also to be seen a wonderful assemblage of races, from every part of the world, the items being characteristic specimens, for they are all bold enterprising energetic men who have found their way to that remote locality.

The brothers Schlagentweit, in their scientific journeys in Central Asia, directed much attention to the physical characters of the people, and more extended inquiries in that direction would

he invaluable, but at present several of the nationalities in British India seem distinct, each of them assimilating in their physical appearance, to the types of the races, of which they are off-shoots.—*Tod's Rajasthan*, Vol. II. p. 317. *Capt. Herbert* at p. 939 of the *Gleanings of Science*. *Heber's Journal*, Vol. I. p. 195. *Mrs. Hervey*, *Adventures of a lady in Tartary*, &c., Vol. II. p. 5. *Gentleman's Magazine*. See India.

RADAM. HIND. *Taraxacum officinale*.

RADAMI. TAM. *Barringtonia acutangula*.

RADAWAR. GUZ. HIND. Bloodstone.

RADE. HIND. *Ribes rubrum*.

RADEEN. JAV., a title in Dutch India.

RADEMACHIA INCISA, *Thunb.*, var. a. syn. of *Artocarpus incisa*.—*Willde.*

RADEMACHIA INTEGR. *Thunb.* Syn. of *Artocarpus integrifolia*.—*Linn.*

RADHA. The celebrated mistress of Krishna, she was the wife of a cowherd of Gokal, with whom she lived within a forest near the Jumna, she was one of Krishna's favourite mistresses, the chief of the Gopi or nymphs of Vrij. She has been deified by the hindoos and her image is set up in the temples, and worshipped at the festivals with that of Krishna. Radha, is a Sanscrit word from radh, to accomplish.—*Cole. Myth. Hind.*, p. 45. *Tod's Rajasthan*, Vol. I. p. 530. See Charan Dasi; Hindoo; Inscriptions; Krishna; Vallabhi; Sakhi Bhava.

RADHA, wife of Duryo-dhana's charioteer, and nurse of Kerna, whom she reared as her son, after he was exposed on the banks of the Yamuna by his own mother.—*Hind. Vol. I. p. 34.*

RADHA-KOOND, four miles from Goverd'hun, the hoary and holy mount connected with the richest associations, of the hindus and beheld by them with an absorbing interest. The Greeks had their Olympus and the Hebrews their Sinai; the Jain sect have their Parinath, the Saiva hindoo their Kailasa, and the Vaishnava hindoo their Goverd'hun. The Christian pilgrim to Judea, sees Bethlehem and Jerusalem, and then goes to Sinai. The Vaishnava pilgrim in Vrij sees Muttra and Brindabun, and then goes to Goverd'hun. Goverd'hun is the Parnassus of the hindoos. Indeed, taking Krishna for Apollo, the Gopini for the Muses, and the Mans-gunga—a large beautifully faced tank—for the fount of Castalie, it out and out justifies the comparison. The especial holiness of Goverd'hun is owing to its being the first scene of Krishna's apotheosis. It was upon this mount that the first image was raised to his worship under the name of Goverd'hunath. The great annual mela or religious fair of Anna-coot at Goverd'hun, first instituted by Vallabha, generally takes place in the month of Karteeka, and not less than a hundred thousand people assemble. It celebrates a pastoral incident in the life of Krishna, and throughout all Vrij the horns of the cattle are painted red with vermilion and those of a cow are occasionally seen covered with silver leaf. Radha Vallabhi, is the name of a sect of Vaishnava hindus, literally the lord and lover of Radha, whose worship is paid to Krishna, on account of his favorite mistress Radha. Radha is the object of adoration to all the sects who worship that deity, and not unfrequently obtains a degree of preference that almost throws Krishna into the shade. This sect was founded

at Vrindavan, in the 16th century, by Hari Vans. Radha Vallabhi are two Sanscrit words from rad'h to accomplish and vällābhā, beloved. —*Tr. of Hind. Vol. II, p. 111.*

RADHIA or Razziab, assumed the Government of India but was deposed by her brother Bahram-Shah.

RADHIYA. See Buddha.

RADHUNEE. BENG. Bengal parsley, *Pimpinella involuerata*.

RADICE DI COLUMBO. It. Colombo root.

RAD-I-KUFR, part of the mahomedan creed. See Kalamah

RADISH.

Mulli..... DUK. HIND. Lobak..... MALAY.
Mara..... GUZ. Mulaka..... SANS.
Raphanus sativus: var *a.* Mulinghi..... TAM.
radicula, var *b.* niger.

This vegetable may be sown at the commencement of the rains, either in beds broadcast, or on ridges of beds where other vegetables have been planted, in the rainy season, they grow better on the ridges. The seed would be trodden in, or beaten down, and then a good watering given to them. When about three inches high, carefully thin, leaving at least a space of five fingers' breadth between each plant. They take from three to five weeks to come to perfection, and require a good share of watering. The turnip radishes are of various colours—white, red, spanish black, round, purple: also long white, red, and purple. The red, white, pink and purple turnip varieties succeed best on the plains, the black Spanish R. niger is of little value, the seed pods when young make excellent pickles. The horse radish is *Cochlearia armoracea*.—*Linn. Riddell. Jaffrey.*

RADISH SEED OIL. Oils of *Raphanus oleifera* and *R. sativa*.

RAE. The hindu titular designations are Rae prince, Rajah, Maha Rajah, and Rae-Rayan. Prince of princes.

RAE. BENG. Small seeded mustard, *Sinapis ramosa*, any species of mustard; also mustard seed.

RAEPUR and Belaspoor, towns in Central India, a number of Gond are scattered about.

RAES. AR. A ruler, a shipmaster, often written Reiss. Riasat, means rule, dominion.

RAE-SUNA. See *Berthelotia lanceolata*.

RAEU. In the Punjab, a race who follow mahomedanism. They are politically insignificant, but are to be found in the vicinity of all great cities. Unrivalled as market-gardeners, they carry on an elaborate and perfect cultivation.

RAFFIA-UD-DOWLA succeeded his brother Rafia-ud-Darjat, but died a natural death a few days after his accession.

RAFFLESIA. A genus of plants of the natural order *Rafflesiaceae*, one species of the Archipelago, has a blossom three feet in diameter which weighs 14 lbs. They are stemless, parasitical, plants, and grow in Sumatra and Java, the species known are *R. Arnoldi*, *R. Patma*, *R. Cumingi*, *R. Horsfieldii*, *R. Rochussenii*, deemed to have astringent and styptic properties.

RAFFLES, Sir Thomas Stamford, Governor of Java, author of the history of Java, Lond. 1817, 2 vols. 4to. and other valuable works on the Malay peninsula. He was one of the most remarkable of the many distinguished men who have risen from the ranks of the East India Company's civil service, the founder of that now invaluable *entrepot* of commerce, Singapore, one of the best and most astute of the Governors of our smaller Eastern dependencies, and the founder and first president of the Zoological Society. He was born at sea, near Jamaica, on the 5th of July 1781. From his infancy he was accustomed to an adventurous life. His father, Benjamin Raffles, was one of the oldest captains, in the trade of those seas, out of the port of London. Placed at an early age at a school in Hammersmith, he quickly developed the characteristics of thoughtfulness and close application which were among his distinctions; and though his education was not complete or fine, he acquired much knowledge during the brief opportunity he enjoyed. At fourteen he was placed as an extra clerk in the East India House. Thus drawn from the form and scholar's desk, he did not abandon learning. His leisure hours were never idle. Principles of a strong elevated character, directed his conduct. He was conscious of the talents which graced him. He appreciated himself with an honest candour, but still with modesty. His abilities were speedily acknowledged by the Indian government, and when, in 1805, the Court of Directors resolved on consolidating the establishment at Penang, Raffles was named assistant secretary and towards the close of that year, he arrived in the Indian Archipelago.

Lady Raffles, his widow, wrote a "Memoir of Sir Thomas Stamford Raffles," a work very creditable to her literary talent, and excellent in feeling. Lady Raffles was the second wife of Sir Stamford, to whom she was married in 1817. Her maiden name was Sophia Hull; she survived her husband 22 years, and died on the 12th of December 1858, aged 72, at Highwood, near Hendon, Middlesex, an estate purchased by Sir Stamford shortly after his return to England in 1824.—*John's Indian Archipelago, Vol. II., p. 44.*

RAFZI. Heretic, the sheeah mahomedan so called by the soonee.

RAG. HIND. *Abies Smithiana*, *Picea Web-biana*, Himalayan spruce.

RAG. HIND. A vein ; a flaw in a jewel.

RAGA. MALAY. A basket, a grain measure of the Sooloo and Sunda isles, in weight 53½ lbs.

RAGA. SANS. Passion, from *runj.* to colour. Viragi, void of passion.

RAGEE. CAN. DUCK. HIND. a species of millet, *Eleusine coracana*.—*Gert. Roxb.*

RAGEU. A very remarkable animal, half goat and half deer ; the flesh is good and tender, dark coloured, and lean. It is called "Ragoah," according to Hodgson, but it is not the *Procapra picticaudata* of Tibet.—Dr. Hooker's dogs caught a "Rageu" at Choongtam.—*Hooker's Him. Jour. Vol. II. p. 98.*

RAGGI. TEL. Copper.

RAGHA. In Northern Media, the eleventh settlement of the Arians (xii. verse 16.) "Ragha with the three races is doubtless the Rhagæ of Strabo and Ptolemy, the greatest city in Media," south of Teheran. This north-eastern portion of Media includes the passes of the Caspian. The possession of these passes was a protection to the other Arians, and at the same time the key to the whole of Media, and therefore Persia. The district is called also Choana (Qwan.) Ahriman established here unbelief in the spiritual supremacy of Zarathustra—another schism, or at all events another portion of ancient Arian history. See Arians.

RAGHA. *Picea Webbiana* ; *Picea pindrow*, the silver fir.

RAGHI CHETTU. or Ravi chettu, TEL. *Ficus religiosa*.—*Linn.*

RAGHUVANSA. A Sanscrit work by Kalidasa.

RAGI. DUK. CAN. HIND. *Eleusine coracana*. E. stricta, *Roxb.* Natchenny.

RAGL TEL. Copper.

RAGOJI BHOONSLAH invaded the Carnatic, and took Trichinopoly. See Bhonsla Rajas of Nagpur ; Mahratta Governments in India.

RAGONATHPUR. A town in Manbhoom.

RAGOOGURH. The Rajpoots of Ragoogurh are known by the name of Kychee and are one of the oldest families in Malwa. In 1780, Madhojee Sindia stripped the family of their possessions and imprisoned the rajah Bulwunt Sing and his son Jey Singh. Jey Sing maintained the war with Sindia till 1818 when he died leaving his title to be disputed by two claimants Dhokul Sing and Ajeet Sing. The matter was complicated by disputes in the family, and at last, in 1843, with the consent of the British Government, arrangements were made and Chuttersaul got 32 villages yielding rupees 9,000. Ajeet Sing received 120 of the 204 villages originally granted to his family.

RAHAT. See Abhignyawa. Buddha.

RAHIM. AR. Merciful, an attribute of the deity.

RAHMAT. See Naksh-i-Rustoom.

RAHTOR. A dynasty of Kanouj, afterwards continued in Marwar or Jodhpur. They commence authentic history in A. D. 300 ? By Yavanasva, prince of Parlipur ? supposed of Indo-Scythic origin. In A. D. 1381, Chonda assaulted Mandor and made it his capital. In 1680, was murdered, Ajit Singh, in whose reign occurred the Rahtor conflict at Delhi, 4th July 1679 (7th Sravan. S. 1716) and the thirty years' war against the empire ; he was murdered by his son. The *Okaran* are the sacred order of the Rahtor country ; the warlike tribes esteem the heroic lays of the bard more than the homily of the brahmin. The Charan are throughout revered by the Rahtor, and hold lands, literally, on the tenure of 'an old song.' In Colonel Tod's time, the genealogical roll of the Rahtor was about fifty feet in length, commencing as usual with a theogony, followed by the production of the first Rahtor from the spine (raht) of Indra, the nominal father being "Yavanaswa, prince of Parlipoor." Of the topography of Parlipoor, the Rahtor had no other notion than that it was in the north ; the genealogies trace their pedigree to Cush, the second son of Rama ; consequently they would be Suryavansa. But by the bards of this race they are denied this honour ; and although Cushite, they are held to be the descendants of Kasyapa of the Solar race, by the daughter of a Dyte (Titan). The progeny of Hirna Kasyapa are accordingly stigmatized as being of demoniac origin. They, however, succeeded to the Lunar race of Cushnaba, descendants of Ujamida, the founders of Canouj. In-

deed, some genealogists maintain the Rahtor to be of Kusika race. The first locality of the Rahtor was Gadhipoor, or Kanouj, where they are found enthroned in the fifth century; and though, beyond that period, they connect their line with the princes of Kosula or Ayodia the facts rest on assertion only. In the period approaching the Tartar conquest of India, we find them contesting with the last Tuar and Chohan kings of Delhi, and the Balica-rae of Anhulwarra, the right to paramount importance amidst the princes of India. The combats for supremacy, destroyed them all. Weakened by internal strife, the Chohan of Delhi fell, and his death exposed the north-west frontier. Canouj followed; and while its last prince, Jyechund found a grave in the Ganges, his son Seoji sought an asylum in Maroost'hulli, the regions of death. Seoji was the founder of the Rahtor dynasty in Marwar on the ruins of the Purihara of Mundor. Here they brought their ancient martial spirit, and a more valiant being exists not than can be found amongst the sons of Seoji. The Mogul emperors were indebted for half their conquests to the lakh Turwar Rahtoran, the 100,000 swords of the Rahtor. The Rahtor has twenty-four sa'ha. The Rahtor of Bikaner are unchanged in their martial qualifications, bearing as high a reputation as any other class in India. The Rahtor of the desert have fewer prejudices than their more eastern brethren; they will eat food, without inquiring by whom it was dressed, and will drink either wine or water, without asking to whom the cup belonged. They would make the best soldiers in the world if they would submit to discipline, as they are brave, hardy, easily satisfied, and very patient; but in the inordinate use of opium, and smoking intoxicating herbs, are said to exceed all the Chatees rajkula, the thirty-six royal tribes of India. The piala, or 'cup' is a favorite with every rajpoot who can afford it, and is, as well as opium, a panacea for ennui, arising from the absence of all mental stimulus, in which they are more deficient, from the nature of the country than most of their warlike countrymen.—*Tod's Rajasthan, Vol. ii. p. 115, 196, 232. Thomas' Prinsep, p. 253.*

RAHU, in hindoo astronomy, the moon's ascending node, is derived from a verb literally meaning to abandon, void, hence also black, darkness, shadow, &c., and is represented in hindoo mythology as having no body, the umbra of the astronomers. The umbra may be said to devour, as it were, the luminaries. In a physical sense the hindus consider it as one of the obscure planets, which occasion eclipses; but, according to mythology, Rahu is the head of a monster, of which Ketu the descending

node, is the trunk. It is supposed by some commentators to be the Typhæus of Hæsioid. Râhu is fabled to have been translated to the stellar sphere, and became the author of eclipses by occasionally swallowing the sun and moon. The origin of the hostility of Râhu to the sun and moon is this. When the gods were drinking the amrita produced at the churning of the ocean, Râhu, a demon, assumed the form of a god, and began to drink, also, when the sun and moon, in friendship to the gods, revealed the deceit. His head was then cut off by Vishnu, but being immortal by having tasted the amrit, the head and tail retained their separate existence, and were transferred to the sky. The head became the cause of eclipses by its animosity to the sun and moon, and the tail became ketu or the descending node. "And now thou fall'st a prey to death, like the full moon to Râhu's jaws consigned."—*William's Story of Nala, p. 209, 210. Wilson, Malathi Madhava, p. 115. See Graha; Ketu.*

RAH-ZANI. PERS., literally to strike on the road, a highway robber.

RAI also Ra HIND., and Pind-Rai, Abies Smithiana, Himalayan spruce, often 100 feet high, and 5 feet in diameter.

RAI, the lowest of all the titular honors bestowed on hindus, as Rai Futtah Chand, Rai Ruttun Chand. See Rae.

RAI. BENG. DUK. GUZ. HIND. Species of Sinapis, or mustard, viz., S. alba, racemosa, ramosa, trilocularis, chinensis, cristimoides.

RAI, or Sarshaf, HIND. Brassica campestris, also B. juncea. Rai Banarsi. Brassica campestris.

RAI of Kullu and Kangra, Abies Smithiana. Hooker.

RAI or RAJAN, a fair, good-looking, class of men dwelling throughout the plains of the Punjab in villages of their own or holding divisions of villages on equal terms with the Jat and others, and under a similar constitution. They are not martial, but apply the finer cultivation to the best lands, for which they pay a high revenue and are much appreciated by native Governments. They are the best cultivators in the province.

RAIANG. HIND. Abies Smithiana.

RAIAN-I-ROOMI. PERS. Aniseed.

RAICHORE, a town and a Doab or Meso potamia in the centre of the Peninsula of India, in the dominions of the nabob of Hyderabad. It has an area of 6,600 sq. miles and a population of 500,000.

RAI DAS, founder of a hindoo sect called Rai dasi.

RAI DASI, a sect of vaishnava hindus, founded by Rai Das, a disciple of Ramanand,

and himself originally a chamar or worker in leather and hides.

RAI DROOG. See Kali.

RAIEN. A mahomedan tribe on either side of the Indus, south of Kalabagh and around Multan.

RAIGAR, in Mherwara, workers in skins.

RAIGURH. An old chiefship now attached to the Sambalpur district of Central India. It lies between 83° and $83^{\circ} 35'$ of east longitude, and between $21^{\circ} 45'$ and $22^{\circ} 35'$ of north latitude, and is bounded on the north by the native states of Sirguja and Gangpur under Chota Nagpur, on the south by the river Mahanadi and the Sambalpur khalsa, on the east by the zamindari of Jaipur or Kolabira, on the south-west by the zamindari of Chandrapur, and on the north-west by the feudatory state of Sakti under Bilaspur. The principal castes are agricultural, Kolta, Agharia, Kanwar, Saonra, Gond and Bhumia; others Brahmans, Rajputs, Mahanti, with a fair proportion of artisans. A chief of Raigurh, as a reward for his fidelity and services, was declared to be under the special protection of the British Government.

RAIHAN. HIND. *Ocimum pilosum*.

RAIHANI. HIND. A kind of emerald.

RAIIDÆ or Raiinæ, a sub-order, or family, of Plagiostomous Cartilaginous Fishes, of which the common ray is the type. See Fishes.

RAI JAMUN. HIND. *Eugenia jambolana*.—*Lam.*

RAI KA-TEL. GUZ. HIND. Oil of *Sinapis alba*, &c. Mustard seed oil.

RAIKH-MAHI. A fish (sort of eel) found in the sand of rivers, imported dried via Delhi: considered aphrodisiac.—*Irvine*, p. 150.

RAIL. HIND. *Picea Webbiana*.

RAILUM, a river near Palsorah in Oodeypoor.

RAILWAYS were first attempted to be introduced into India, in 1845, by two companies, termed the East India and the Great Indian Peninsula Railway Company, but the projectors found it necessary to apply to Government for aid, and Government guaranteed five per cent. for a term of 99 years, giving the land. In 1864-5, the length of rail in course of construction by eight Railway Companies was 4,944 miles. The estimated necessary capital being £81,000,000.

The most important engineering works connected with Indian railways were on the Thull ghaut, by an incline of nine miles and quarter, in the course of which the northern branch of the G. I. P. Railway attains an elevation of 972 feet. The southern branch is taken through the mountains of the Bhor ghaut, by an incline nearly 16 miles long with a total elevation of 1,831 feet by a

series of cuttings, tunnels, viaducts and embankments, which are only rivalled by those on the Thull ghaut. Sir Macdonald Stephenson, civil engineer, native of Great Britain, was the first who, in 1843, suggested railways for India during the administration of Lord Ellenborough, but Mr. Bird, his successor, took up the subject. It was not encouraged either by the Court of Directors or the London mercantile community. Subsequently, during Lord Hardinge's administration and on his recommendation, the Court of Directors granted the land for a line from Calcutta to Delhi with a guarantee of four per cent. of interest on five millions sterling, and this was the first of the guarantees which have since been extended to canals, irrigation channels and other railroads. The first to progress was the East Indian and Great Indian Peninsular Railways, when contracts were signed in August 1849, with a free grant of land for 99 years with five per cent. interest guaranteed. During Lord Dalhousie's administration, the railway schemes made progress, and on the 18th November 1852, Bombay saw the first passenger train run. On the 20th April 1853, Lord Dalhousie, in a minute, urged their extension for strategic purposes, and on political and commercial grounds, and he mapped out certain trunk lines. Up to 1868, there were 8 lines of Railway guaranteed, for a distance of 5,607 miles with a guaranteed capital of £84,386,000 sterling. In one year, the passengers were 13,746,000, of whom 95 per cent. were of the third class. The average cost per mile has been about £16,000, and in some instances £20,000, but with due economy about £10,000, the mile is the amount estimated. During the year 1866, the length of line open for traffic increased from 3,331 to 3,638 miles; and the extent now sanctioned (including the Indian Branch Railway) is 5,641 instead of 4,924 miles.

At the commencement of the year 1870, a length of 4,283 miles of railway was open. In 1871, 5,051 miles were open, 557 miles having been added during 1870 and 211 during 1871. The most important section completed in 1870 was from Sohagpore to Jubulpore on the G. I. P. line, by means of which railway communication between Bombay and Calcutta was established. Next in importance was the completion of the Sutlej bridge, by which Lahore and Delhi were joined. The year 1871 has seen Bombay joined to Madras by the linking together of the Madras and the G. I. P. railways at Raichore. Thus the system of trunk lines originally laid down by Lord Dalhousie may be regarded as completed. Commencing at Negapatam the most southern terminus of the present Madras system, and

proceeding by Bombay, Jubbulpore, Allahabad and Lahore, to Mooltan, on the Indus, a continuous length of about 2,800 miles of railway has been formed. Very little has been done on State Railways, which delay appears to be due to the much vexed question of gauge. This question has been happily, or unhappily settled. The Punjab Northern Railway (between Lahore and Peshawur) 270 miles in length was to have £200,000 expended on it during 1871. The total cost of the line was estimated at about £3,000,000.

The Indus Valley Railway starts from a point six miles west of Mooltan on the Punjab Railway, and runs through Shoojahad and Bhawalpore to Sukkur and thence to Kotree. The chief difficulty about this line is to determine on which side of the river it is to run. But it should be on the left to be protected by the river from any invading force from the north-west. For Rajpootana, lines have been surveyed from Agra to Ajmeer, via Jeypore and Sambhur, 236 miles, and from Delhi via Rewaree and Tellour, 125 miles, to join the above, with a branch of eight miles to the Salt Works. Operations were commenced on the line between Delhi and Rewaree, on an outlay of 50,000*l.* during 1871. The line to Ajmeer will probably be taken, ultimately, on to Indore, from which place to Khundwa, on the Great Indian Peninsula Railway, a line, 84 miles in length, has been laid out. A treaty was made in 1871 between the British Government and the maharajah of Jeypore for the lease of the Sambhur salt lake, allowing the British Government the exclusive right to manufacture and sell salt there. The line from Carwar to Hooblee, south of Bombay, is still under consideration. The difficulties of this scheme, and the expensive nature of the works over the ghats, made it necessary to survey the ground afresh. More favorable gradients and easier works than were originally contemplated have now been found practicable. The railway from Goolburga, on the Great Indian Peninsula, to Hyderabad, is to be constructed by the Nizam. It will be about 116 miles in length, will go by Secunderabad to Trimulgherry and is to be constructed on the broad gauge. Colonel Strachey, Colonel Dickens and Mr. Rendel, Consulting Engineer to the East Indian Railway Company, recommended 2 feet 9 inches of gauge and Mr. Fowler, 3 feet 6 inches. The former were of opinion that "to obtain the greatest economy in construction, and consequently the greatest possible extension of railways in India the gauge selected should be the narrowest which would combine convenience of transport for various kinds of goods and passengers with reasonable speed, and with economy and safety in working," and these conditions they thought would

be fulfilled by a 2 feet 9 inch gauge. Mr. Fowler was of opinion that a width of 3 feet 6 inches should be adopted "on the ground that it was not greater in first cost of works and rolling stock than a gauge of 2 feet 9 inches, and was greatly superior in carrying capacity, convenience and economical working. This opinion was overruled by the other members of the committee, who considered that the cost of a railway was in proportion to its gauge, though a glance at the section of a railway bank or cutting would prove the contrary. Mr. Hawkshaw, Consulting Engineer to the Madras and Eastern Bengal Railways, and Mr. Bidder, Consulting Engineer to the Sind, Punjab and Delhi Railway were both opposed to the adoption of any other than the existing gauge (5 feet 6 inches) for future lines as they might be required as branches to or extensions of existing lines of railway. They attached great importance to the inconveniences arising from a break of gauge, and contended that the very small saving which might be secured by the adoption of a narrow gauge would be more than counterbalanced by these disadvantages. These opinions were transmitted to the Government of India in October 1870, and that Government has since decided that 3 feet 3½ inches shall be the future narrow gauge for Indian Railways. This dimension, the French metre, is a puzzling quantity to deal with, and nothing has been made known as to the cause of its being adopted.

In 1870, the average number of persons employed on all the opened lines in India was 13.9 per mile, the proportion of Europeans and East Indians to natives being nearly as 1 to 13. The number per mile employed on the East Indian is 16.4; the number on the G. I. P. is 18; on the Bombay, Baroda and Central India it is 15, and on the Madras 10. In 1870 the G. I. P. was the dearest and the Madras the cheapest worked railways in India. The number of passengers killed and injured by accidents during 1870 was 13 and 63 respectively, as against 48 and 92 in 1869; and the number who died from heat apoplexy, exhaustion and cholera in the trains and stations was 114. The accidents in the way of running over cattle were 314; 53 by the Madras Railway, 128 by the East Indian, 52 by the Great Indian Peninsula, and 46 by the Bombay, Baroda and Central India. Sixty-nine collisions were reported in 1870, against 78 in 1869 and 64 in 1868. There were 258 cases of running off the proper line in 1870 against 149 in 1869. Of these 258 accidents, 182 occurred on the Great Indian Peninsula; 49 on the Sind, Punjab and Delhi and only 10 on the East Indian Railway. The following gives the number of miles open, the cost per mile, and

RAIN.

the total cost of the principal Indian railways up to the 31st March 1871.

	Miles.	Per mile.	Total cost.
E. I. R....	1503	330,227	£30,401,276
G. I. P....	1872	17,623	22,417,464
M. R.....	832	11,716	9,741,135
B.B. & C.I.	312	23,833	7,436,158
S. P. & D..	675	14,972	10,106,700
G. S. I....	168	8,658	1,454,666
E. B....	159	17,938	2,860,667

The revenue derived from railways during the year 1870 was £2,864,600 being about £340,000 in excess of the previous year. The gross receipts were £6,213,865 and the expenses £3,367,261. The Nerbudda coal fields are likely to be available for railways in Central India and hopes are also entertained of the Chanda coal fields. In the Punjab and Sind a system has been organized, similar to that of the Madras Railway, for growing trees for fuel. The right of purchasing the different guaranteed lines from their companies can first be exercised by the Government as under ;

The Bombay Railway was opened 16th April 1853.

Railway employees in India, in 1867, numbered ten thousand christians, who by regulations then introduced became more of State servants. The Bombay and Baroda railway crosses the Tapti, Nerbudda and Mahi rivers over great bridges and viaducts. One railway, 850 miles long, down the Euphrates valley has been planned, to terminate at Bussorah in the Persian gulf and at Seleucia in the Levant.

RAIMANDRUG, L. 13° 21' 3", L. 77° 59' 5" N. E. of Davanballi, is a hill station 4,226 feet above the sea. See Ramandroog.

RAIN. HIND. An industrious class of cultivators in the Punjab : great vegetable growers. See Raïen ; Raïan.

RAIN.

Mo..... BURM. | Bursat..... HIND.

The occasional showers which fall throughout the year in Britain, are unknown in most Asiatic countries, and the first particular to attend to in examining their climates is the season and the quantity of the periodical rains. It is this which regulates husbandry, and on which in many countries the temperature and succession of the seasons in a great

RAIN.

measure depend. The globe is wrapped in a layer of air about forty miles high. This air is chiefly a mechanical mixture of oxygen and nitrogen, but is also the recipient of all the volatile matters which rise from the surface of the globe, and amongst others of watery vapour in proportionally large quantity. And the manifold climates of the world are caused by the mutual relations of this layer of air, and sea and land ; and the changes of weather, heat and cold, drought and rain, cloud and sunshine, calm and tempest, all depend upon the movements into which it may be thrown. When its temperature is lowered the moisture in the air falls in rain, hail, or snow. In the tropics the sun's rays fall more vertically on the air than elsewhere, and its rarefied particles constantly rising form a column ever moving towards the poles. To fill the vacuum thus caused the denser air from the frozen poles rush down over the surface of the globe towards the equator, and hence result the great polar and equatorial air currents, the direct courses of which between the poles and the equator are bent by the revolution of the earth on its axis, in the northern hemisphere into the north-east, and in the southern into the south-east trade winds or vents alises. "The wind goeth towards the south, and turneth about unto the north, it whirleth about continually and returneth again according to its circuits." The land becomes hotter and hotter more quickly under the sun, than the sea does, and the consequence is that when the sun becomes vertical over any portion of the land it draws the surrounding air to a focus there ; and in this way in every latitude the great primary world winds and rains are broken into secondary or local winds and rains ; producing the differences in nature and time of the climates which prevail over the globe. Owing to the excess of land in the northern hemisphere the constant belt of rain, where it exists between the trades, instead of corresponding with the equator lies a little to its north, and the moisture gathered by the south-east trades only falls in rain when it reaches the tropic of Cancer, thus compensating the northern hemisphere for its want of evaporating surface. Similar modifications and compensations on a smaller scale, occur in regard to each of the trades separately, as the sun successively traverses the north and southern ecliptic. India stretches out into the belt of the north-east trades, and were these undeviating winds, the only rain which the Deccan would receive would be that gathered by them in the Bay of Bengal from October to April and poured down on Madras during its N. E. monsoon. But at the vernal equinox (March 21st) the sun passes from the southern hemi

sphere to the northern, is first vertical over Bombay about May 15th, reaches the highest point of his upward journey June 21st, the summer solstice, descending, is again vertical over Bombay about July 27th, and finally on September 21st, the autumnal equinox, having traversed the whole tropic of Cancer, re-enters Capricorn. Between May and July the sun shines down furiously on the great grassy plains of Central Asia from which so vast a current of rarefied air ascends up into heaven, that the resulting vacuum has the power not only to completely reverse the direction of the north-east trade, but even to draw and deflect the S. E. trade towards India. Thus is the south-west monsoon brought about. This rushing mighty wind, laden with moisture gathered from the Indian ocean, strikes Malabar and the Concan at nearly right angles, and there, chilled by the cool green forest barrier of the ghats, pours it down on Western India for four months in violent rains, which are ushered in and depart amidst the most terrific thunder storms. And thus it is that the temperature also is lowered during months that otherwise would be so hot as to make the Western Coast of India scarcely habitable. The ghats however, which cause the rain to pour down on Bombay shut it off from Madras. The Deccan, sloping eastward, the superfluous rain which falls on the ghats and which does not flow into the Concan, drains off to the Bay of Bengal as the great continental rivers, Godavery, Palaur, Cauvery, Pennar, and Kistna. The Ghats cease about Surat; and there the Sautpoora, Vindhya and Aravalli mountains condense the clouds borne by the south-west wind, and flood Surat and Baroach with the Taptee and Nerbudda—the only Deccan rivers flowing westward—and Guzerat and a large portion of Rajpootana with the countless affluents of the Sabermutty. The influence of the south-west wind reaches to the Himalaya—but not sufficiently to irrigate the wide plains of Hindoostan, the Punjab, and Sindh. At the very time that the sun is drawing all the vapours of the Indian Ocean to the coasts of India, his rays are melting the snows of the Himalaya and Hindoo Kush, which flow down to the Bay of Bengal and the Arabian Sea as the sacred Ganges and primæval Indus. Thus is India watered, and that transport provided for its world-famous products, but for which they never would have become of so great economic value. It is a wonderful scheme of forces and phenomena all harmoniously, unerringly, and inflexibly working together for good, by the infinite intelligence, goodness and power of God.

Each inch of rain-fall represents a ton of water per acre. Out of the 1,000 miles of Ghat along the western coast of India, taking

the single top of Mahableshwur, and estimating its surface at 6,000 acres, and the rain-fall on it at 300 inches a year, it results that 180,000,000 of tons of water fall on it yearly. More than half of the rain which falls on the Ghats pours down into the sea.

The most remarkable rainy season in India, is that called the south-west monsoon. It extends from Africa to the Malay peninsula, and deluges all the intermediate countries within certain lines of latitude, for four months in the year. In the south of India this monsoon commences about the beginning of June, but it gets later as we advance towards the north. Its approach is announced by vast masses of clouds that rise from the Indian Ocean, and advance towards the north-east, gathering and thickening as they approach the land. After some threatening days, the sky assumes a troubled appearance in the evenings, and the monsoon in general sets in during the night. It is attended with such a thunder-storm as can scarcely be imagined by those who have only seen that phenomenon in a temperate climate. It generally begins with violent blasts of wind, which are succeeded by floods of rain. For some hours lightning is seen almost without intermission, sometimes it only illuminates the sky, and shows the clouds, near the horizon; at others it discovers the distant hills, and again leaves all in darkness, when in an instant it re-appears in vivid and successive flashes, and exhibits the nearest object in all the brightness of day. During all this time the distant thunder never ceases to roll, and is only silenced by some nearer peal, which bursts on the ear with such a sudden and tremendous crash as can scarcely fail to strike the most insensible heart with awe. At length, the thunder ceases, and nothing is heard but the continued pouring of the rain, and the rushing of the rising streams. The next day presents a gloomy spectacle: the rain still descends in torrents, and scarcely allows a view of the blackened fields: the rivers are swollen and discoloured, and sweep down along with them the hedges, the huts, and the remains of the cultivation which was carried on, during the dry season, in their beds. To persons who have long resided in India, these storms lose much of their grandeur, yet they sometimes rise to such a pitch, as to make an impression on those most habituated to them. It was mentioned to Mr. Elphinstone by a gentleman who had been for some time in Malabar, the province most distinguished for the violence of the monsoon, that he there heard a clap of thunder which produced a silence of a minute in a large party of officers, and made a great part of the company turn pale. This lasts for some days, after which the sky clears, and discovers the face of nature changed as

if by enchantment. Before the storm, the fields were parched up and, except in the beds of the rivers, scarce a blade of vegetation was to be seen : the clearness of the sky was not interrupted by a single cloud, but the atmosphere was loaded with dust, which was sufficient to render distant objects dim as in a mist and to make the sun appear dull and discoloured, till he attained a considerable elevation: a parching wind blew like a blast from a furnace, and heated wood, iron and every other solid material, even in the shade ; and immediately before the monsoon, this wind had been succeeded by still more sultry calms. But when the first violence of the storm is over, the whole earth is covered with a sudden but luxuriant verdure ; the rivers are full and tranquil ; the air is pure and delicious ; and the sky is varied and embellished with clouds. The effect of the change is visible on all the animal creation, and can only be imagined in Europe by supposing the depth of the dreary winter to start at once into all the freshness and brilliancy of spring. From thistime the rain falls at intervals for about a month, when it comes on again with great violence, and in July the rains are at their height ; during the third month, they rather diminish, but are still heavy : and in September they gradually abate, and are often entirely suspended, till near the end of the month, when they depart amidst thunders and tempests as they came. Such is the monsoon in the greater part of India. It is not, however, without some diversity, the principal feature of which is the delay in its commencement, and the diminution in the quantity of rain, as it recedes from the sea. So that no trace of it can be perceived at Candahar. A remarkable exception to this rule, is, however, to be observed in the north-east of Afghanistan, which although much further from the sea than Candahar, is subject to the monsoon, and what is equally extraordinary, receives it from the east.

These anomalies may perhaps be accounted for by the following considerations. It is to be observed that the clouds are formed by the vapour of the Indian ocean, and are driven over the land by a wind from the south-west. Most part of the tract in which the kingdom of Caubul lies, is to leeward of Africa and Arabia, and receives only the vapours of the narrow sea between its southern shores and the latter country, which are but of small extent, and are exhausted in the immediate neighbourhood of the coast. India, lying further east, and beyond the shelter of Africa, the monsoon spreads over it without any obstruction. It is naturally most severe near the sea from which it draws its supplies, and is exhausted after it has passed over a great extent of land. For this reason, the rains are more or less plentiful in each country, according to its distance from the sea, except in

those near high mountains, which arrest the clouds, and procure a larger supply of rain for the neighbouring tracts, than would have fallen to their share, if the passage of the clouds had been unobstructed.

The obstacle presented to the clouds and winds by the mountains has another effect of no small importance. The south-west monsoon blows over the ocean in its natural direction ; and, though it may experience some diversities after it reaches the land, its general course over India may still be said to be towards the north-east, till it is exhausted on the western and central parts of the peninsula. The provinces in the north-east receive the monsoon in a different manner : the wind which brings the rains to that part of the continent, originally blows from the south-west, over the Bay of Bengal, till the mountains of Himalaya, and those which join them from the south, stop its progress, and compel it to follow their course towards the north-west. The prevailing wind, therefore, in the region south-west of Himalaya is from the south-east, and it is from that quarter that the provinces in Bengal receive their rains. But when the wind has reached so far to the north-west as to meet with the Hindoo Coosh, it is again opposed by that mountain, and turned off along its face towards the west till it meets the projection of Hindoo Coosh and the Soliman range which prevent its further progress in that direction, or at least compel it to part with the clouds with which it was loaded. The effect of the mountains in stopping the clouds borne by this wind, is different in different places. Near the sea, where the clouds are still in a deep mass, part is discharged on the hills and the country beneath them, and part passes up to the north-west ; but part makes its way over the first hills, and produces the rains in Tibet. In the latitude of Kashmeer, where the hills are considerably exhausted, this last division is little perceived : the southern face of the hills and the country still farther south is watered ; and a part of the clouds continue their progress to Afghanistan ; but few make their way over the mountains, or reach the valley of Kashmeer. The clouds which pass on to Afghanistan are exhausted as they go, the rains become weaker and weaker, and at last are merely sufficient to water the mountains, without much affecting the plains at their base, and some parts of the Panjab are almost rainless.

The above observations will connect the following facts :

The south-west monsoon sweeping along from the Indian ocean and Arabian Sea, commences on the Malabar coast in May, and is there very violent, it is later and more moderate in Mysore ; and the Coro-

mandel Coast, covered by the mountainous countries on its west, is entirely exempt from it or only felt in the form of occasional showers. Further north, the S. W. monsoon begins early in June, and loses a good deal of its violence, except in the places influenced by the neighbourhood of the mountains or the sea, where the fall of water is very considerable. About Delhi it does not begin till the end of June, and the fall of rain is greatly inferior to what is felt at Calcutta or Bombay. In the north of the Punjab, near the hills, it exceeds that of Delhi; but, in the south of the Punjab, distant both from the sea and the hills very little rain falls.

The countries under the hills of Kashmeer, and those under the Hindoo Koosh, (Pukhlee, Boonere, and Swat) have all their share of the rains: but they diminish as we go west, and at Swat are reduced to a month of clouds, with occasional showers. In the same month (the end of July and beginning of August) the monsoon appears in some clouds and showers at Peshawur, and in the Bungush and Khuttuk countries. It is still less felt in the valley of the Cabul river, where it does not extend beyond Lughmann; but in Bajour and Punjora, under the southern projection, in the part of the Kafir country, which is situated on the top of the same projection, and in Teera, situated in the angle formed by Takht-i-Soliman and its eastern branches, the south-west monsoon is heavy, and forms the principal rains of the year. There is rain in this season in the country of the Jaujee and Torre, which probably is brought from the north by the eddy in the winds, but it is uncertain whether that which falls in Bunnoo and the neighbouring countries is to be ascribed to this cause or to the regular monsoon from the south-west.

Direct observation will probably at some future period fix the point in the outer Himalaya, at which the quantity of rain—always greater, *cæteris paribus*, among mountains than in level countries is a maximum. Dr. Thomson believes that in the Western Himalaya the greatest quantity of rain will be found to fall on mountains elevated from seven to nine thousand feet. Ranges of mountains which attain an elevation of from ten to eleven thousand feet have already, in the Western Himalaya, a very sensible effect in diminishing the quantity of moisture, as indicated by the vegetation; and when the mountain chains become sufficiently elevated to be capped by perpetual snow, they condense a very great proportion of the moisture of the air-currents which pass over them.

A recent writer in the "Calcutta Review" concludes that the number of trees does not

affect the rain-fall, but he recognises that trees cause an increased deposit of dew, prevent evaporation of moisture from the earth whether derived from rain or dew, and that an increased number of trees is calculated to modify an arid climate very materially for the better. But the general belief is that the presence of trees prevents aridity and barrenness, preserves springs and rivulets; lowers temperature, prevents torrents and conserves soil.

The quantity falling at Neuera-elia has perceptibly diminished of late years probably owing to the extensive clearing of the surrounding forests for coffee planting.

In several parts of the Delhi district, the average rain-fall is about 17 inches; at Umballa 30; Loodiana 20; Hushiarpur 30; Jullundur 25; Umritsar 28; Lahore 16; Montgomery in the Barea Doab 6 inches and Multan $\frac{6}{10}$ ths of an inch.

The rain belt or calm belt between the trade winds travels up and down the earth. It has a mean breadth of about 6° of latitude, but in summer is between 8° and 14° N., and in spring between 5° S. and 4° N. Monsoons are for the most part formed of trade winds. When a trade wind is turned back or diverted by overheated districts from its regular course at stated periods of the year, it is regarded as a monsoon. The N. E. and S. W. monsoons of the Indian Ocean, are the N. E. trade winds turned back by the heated plains of the interior of Asia and the desert of Cobi. The S. W. monsoon prevails from May to September and N. E. from November to March. Doldrums is the rain belt or calm belt of the tropics.

The fall of rain from Cape Comorin to Cutch on the western side, averages 180 inches, some of which, at least 160 inches, are again carried off to sea. The fall on the Concan averages 70, of which 30 flow to the ocean. The mean depth of the ocean is about 4 miles, the greatest depth the sounding line has ever reached is 5½ miles; mean elevation of the land is about 1,000 feet.

Rain sometimes falls to the extent of 12 to 15 inches in India. In the hot season, Madras is often visited with refreshing non-monsoon rains which much reduce the heat of that period, and produce forage for cattle. In 1854, Major Worster published a table of monthly and yearly results of the observations of the rain gauge, at the Madras Observatory, from 1813 to 1854, showing an average annual fall of 49½ inches of rain during the forty-two years. Of this amount 29½ inches fell during the monsoon months of October, November and December,

Average annual fall in the last 31 years...75.42'

When the sun has returned to the northern hemisphere and heated the great arid plains of central Asia, of Tartary, Thibet and Mongolia, these rarify the air of the N. E. trade winds, and cause it to re-ascend thereby creating an in-draught from the air of the Indian ocean. The south-east trade winds therefore rush over into the northern hemisphere, and are thus converted in certain parts of the Indian ocean during the summer and early autumn, into the S. W. monsoon. This wind, from the Indian ocean and sea of Arabia strikes perpendicularly on the western ghats and precipitates its moisture on the narrow strip of land between the ghats and the sea, and it is then that Bombay shares in the fall. Almost all the rain falling in Bombay is brought to it by the south-west monsoon, during the five months of June to October; the Peruvian Andes have a dry and a wet side of the mountains; but Bombay, thirty miles to the west of the Western Ghats, has a dry and a wet season.

The rainfall at Bombay, in the five months, June to October, during the 41 years 1826 to 1866 inclusive, ranged from 35.10 in 1855 to 118.88 inches in 1849. At the undermentioned places the falls are :—

	In.	Weight.
Mahabaleshwur.....	254	25,400
Panchgunnee.....	50	5,000
Poorandhur.....	72	7,200
Murree.....	35	3,500
Dhumsa a.....	152	15,200
Kupowlee.....	70	7,000
Dugshai.....	30	3,000
Simla.....	70	7,000
Nynce Tal.....	100	10,000
Darjeling.....	160	15,000
Cherraponjee.....	400	40,000
Sylhet.....	209	20,900

According to the tables kept by Dr. Morton from the commencement of the year 1841 to the end of 1846, the average annual fall of rain in Tavoy during that time was 216½ inches. Dr. Walter mentioned, in 1857, that the average of the preceding five years had been 194.28 inches, and the greatest recorded fall in one day, was on the 27th of May 1857, when 12.75 inches were registered. Sir James E. Tennant mentions that on the western side of the Dekhan, the mean of rain is

80 inches, and, on the eastern, 52.8 inches fall on the average.

In Ceylon, the average rainfall rarely exceeds 80 inches.

At Mahabaleshwur it is 254 inches.

At Uttray Mullay, in Malabar, 263 inches. At Sylhet 209, and 610.3 at Cherraponji. These data will suffice to show the partial character of the rainfall, in tropical India, at different years. These are regulated by the monsoons, and in June and July, when the fall reaches upwards of 35 inches, its greatest, in the Malabar Coast, little falls on that of Coromandel. A similar fact is noticed by Admiral Fitzroy who mentions that on opposite sides of the Galapagos Islands, while one aspect exposed to the south is covered with verdure, all others are barren and parched. Similarly, the west part of Socotra during the N. E. monsoon is destitute of rain and verdure, whilst the eastern side is enriched by streams and covered by luxuriant pasturage.

In several parts of the world there is no rain at all. In the old world there are two districts of this kind : one, the desert, or Sahara, in Africa, and, in Asia, parts of Arabia, Syria, and Persia ; another district lies between north latitude 30° and 50°, and between 75° and 118° of east longitude, including Thibet, Gobi, Shama, and Mongolia. In the new world the rainless districts are of much less magnitude, occupying two narrow strips on the shores of Peru and Bolivia, and on the coast of Mexico and Guatemala, with a small district between Trinidad and Panama on the coast of Venezuela. The climate of the Khasia mountains, which lie north-east from Calcutta, and are separated by the valley of the Brahmaputra river from the Himalaya range, is on the other hand remarkable for the inordinate fall of rain—the greatest, it is said, which has ever been recorded. Captain Yule, established that in the single month of August 1841, there fell 264 inches of rain, or 22 feet, and that during five successive days, thirty inches fell in every twenty-four hours. Drs. Thomson and Hooker recorded thirty inches in one day and night, and during the seven months of Dr. Hooker's stay, upwards of 500 inches fell, so that the total annual fall perhaps greatly exceeded 600 inches, or fifty feet a quantity which has been registered in succeeding years ! From April 1849, to April 1850, 502 inches (forty-two feet) fell. This unparalleled amount is attributable to the abruptness of the mountains which face the Bay of Bengal from which they are separated by 200 miles of Jheels and Sunderbunds. The district of the excessive rain is extremely limited ; and but a few degrees farther west, rain is said to be almost unknown, and the winter falls of snow seldom to exceed two inches.

Monthly and yearly Rain fall at the Madras Observatory from 1813 to 1860.

RAIPUR. A district in Central India, between L. 80° 28' and 82° 33' and L. 19° 48' and 21° 45' comprising the larger part of the tract known by the name of Chhattisgarh, together with a large area formerly attached to Sambalpur. It is about 150 miles in breadth from east to west, and 135 miles in length from north to south. Like the rest of Central India, Chhattisgarh seems to have been inhabited in the earliest times by Bhunjya and other Kolarian races from the east. The population of Raipur has been recruited from all quarters; but the most important immigrants, and the earliest after the first great

Gond invasion, came from the north. A few wild wanderers in the jungles came from the east, while from the south and west there has been a considerable influx of population. Of the immigrant tribes, the Kurmi, Teli, Lodhi, Chamar, Ahri or Gaira, Gunda and Kanwar seem to have come from the north, though a large section of Teli and some few Kurmi have come from Nagpur. The greater number of immigrants from the south and west are the Halba from Bastar and Chanda, and the Maratha race. The principal cultivating castes are Kurmi, Teli, Chamar and Halba, though, of these, only the Kurmi and Teli are large landholders. The Chamar lay claim to a very high antiquity among the inhabitants of the district. They have all joined

the Raidasi sect formed by Rai Das, a chamar or shoe maker, a reformer, and disciple of Ramanand, who is said to have lived about the fifteenth century in the country lying to the south of Oudh and in Rewa. The creed he preached seems to have been that adopted by Ghasi Das, the celebrated Satnami teacher, who started the great movement among the Chamar race about the beginning of the nineteenth century and who seems rather to have revived the teaching of Rai Das than preached a new religion. The term of Satnami or pure name was that assumed by the followers of Rai Das. As Satnami they are scrupulous about their eating, but slovenly and untidy in their habits, and the houses of even the wealthiest of them are generally miserable hovels. They are generally industrious though careless cultivators, and frugal in the extreme, indulging in no extravagance in dress or jewelry. The dress of the men is usually a single cloth, one end of which encircles their loins and another their head, and the women wear little or no jewelry; yet they rarely make money and seem to want the talent of getting on in the world. Their villages are seldom prosperous, though there are some few malguzar who form conspicuous exceptions to the rule. Though this apparent inability to improve their position is partly due to hindu opposition, yet one great cause of the phenomenon seems to be their individual fickleness and want of perseverance. A very slight cause will send a Chamar cultivator away from his village and though they generally return after a short interval, yet these migrations must necessarily hinder the accumulation of property.

The Gándá or Panka are Kábirpanthi or followers of Kábir, who is said to have appeared in the weaver caste, in the same country and at the same time, as Rai Das, both being disciples of Ramanand, and their doctrines being similar in many respects. Though they cultivate the land, they are not generally esteemed as cultivators, while the few villages they hold as landholders are miserable in the extreme.

The Kanwar are usually looked upon as aborigines, and though their appearance and their preference for the jungles to the cultivated tracts, as well as their abstinence from hindu observances, would seem to point to this opinion, there is also some ground for supposing them to be Rajputs, who settled in early times among the hills of the Vindhyan range, and so failed in becoming hinduised like other warlike immigrants. They have always made a claim, though in a half-hearted way to be considered as Rajputs connected with the Tuar tribe of the north-west, and their claim has certainly been recognized in one instance, as the first Kanwar chief of Narra

received his estate as a dowry with the daughter of the Rajput chief of Khariar. The warlike traditions of the race are preserved in their worship of Jhāgra Khand or Jhāgra Khanda, under the form of a sword, a form of worship not uncommon among Rajput tribes, and recalling to mind the sword which was the national deity of the Hun under Attila, the Kanwar of the present day are most peaceable and quiet, and when once fairly settled in a cultivated country, are industrious and good cultivators and landlords. In the jungles they have conformed generally to the customs of their neighbours, and worship Dula Deo and Burha Deo, as the Gond race also do; and they always seem to be ready to take up with the belief of those about them though all of them, except the richer classes, who wish to be considered good hindus, avoid brahmins. They bury their dead; and marriages are performed before the elders of the village.

The Halba are immigrants from the south, and their principal colony is in the south-west where they hold thirty-seven flourishing villages. They gain their living chiefly by distilling spirits; and worship deified distillers, at the head of whom is Bahadur Kalal. They are, next to the Teli, the best cultivators; except in the jungles, they have generally become hinduised. All that is necessary for a good Halba is that he should sacrifice once in his life three goats and a pig, one to each of the national deities, called Narayan Gosain, Burha Deo, Sati and Ratna.

In the jungles also the old religion of the Gond tribe is disappearing, and while all the Gond worship Burha Deo and Dula Deo the latter being the household god, they know little of Pauritola or Karitola, Barangasura, and Gumartola, who with Burha Deo, form the distinctive gods of the Dhur Gond, to which tribe most of the Chhattisgarh Gond belong. They are all intensely superstitious and worship local deities assiduously; though, except in the jungles, the Baiga or village priest, whose business it is to propitiate the evil spirits of the neighbourhood, is as often as not a Kewat, Teli, or Ahir, as a Gond.

The other aboriginal tribes are the Binjwar, Bhunjia, Suonia, Nahar, and Kamar; of these the Binjwar are allied to the Baiga, who are found in the Mandla district. They chiefly live in the north-east of Raipur, and occasionally cultivate. The Bhunjia are comparatively numerous all through the east of the district, and are particularly so in the Khariar and Bindra Nawagarh zamindari, where they hold a good many fairly cultivated villages. The Suonia use only game. All these jungle tribes seem to have come from Orissa, and their dialects are all akin to Uriya. Except the

Saonra they all gain their livelihood more by collecting jungle produce than by cultivation.

The Beldar of Uriya are tank diggers by profession, and are all under the command of a chief called a jemadar, who holds three villages in the district. Under the jemadar are a number of naik, each of whom has the command of a gang. These gangs have no settled home, but go wandering about the district wherever they can get work.—*Central Provinces Gazetteer*.

RAIN-STONE. This is used by the Turk and Tartar tribes to conjure rain. It is also known among the Kalmak. This stone was called by the Turks Jadah (Pers. Yadah), perhaps the origin of the jade-stone? and may be connected with the Hindi word Jadu, conjuring, in common use in India?—*Quatremere on Rashid-ud-din, p. 428 et seq.; Hammer's Golden Horde, pp. 42 and 436, quoted in Yule Cathay, I. p. cxxxvii. Winter's Burmah, p. 99. Sir J. E. Tennant, vol. i. p. 66. Hooker. Him. Jour. Vol. II., page 282. Curiosities of Science, p. 154.*

RAI RAIAN, the hindoo title next higher to that of Rai. The third titular honour given to a hindu as Rai Raian, Rajah Eswara Doss, Dyawunt Bahadur.

RAISALLA. HIND. Picca Webbiana, Picca pindrow, the silver fir.

RAISANA. HIND. Bertholetia lanceolata.

RAISANI, the most respectable of the Saharawani tribes (from "rais" Arab, a ruler,) are able to raise 500 fighting men. See Kelat.

Raisins are dried grapes allowed to ripen and dry upon the vine. The sweet fleshy grapes which grow upon the sunny sheltered slopes of hills are preferred. When the fruit is ripe, the grapes are thinned and the vine is stripped of its leaves. The sun then completes the saccharification and drives off the superfluous water. When the bunches are plucked they are cleaned, dipped for a few seconds in a boiling lye of wood-ashes and quicklime; the wrinkled fruit is then drained and dried by exposure to the sun upon hurdles for 14 or 15 days. The finest sun raisins are the plumpest bunches left fully to ripen upon the

vine, after their stalks have been cut half through. An inferior kind of raisins is prepared by drying the grapes in an oven. During the 5 years 1847 to 1851, from 10½ to 13½ tons raisins were imported into the United Kingdom. The import duty is 15s. per cwt. from foreign countries, and 7s. 6d. per cwt. from British possessions. They are distinguished by the places where produced or exported, as Malaga, Valencia, Persian, Smyrna, &c.; or from the variety of grape or mode of preparation, as, muscatels, blooms, sultanas, &c. Kishmish sabz, or green raisins are dried in the shade, and preserve a pale green color; 4 seers 8 lbs. are sold per rupee. Kismis sabz and kismis surkh are both varieties of the small raisin, called in England the sultana, or seedless raisin. The "Munakka," of N. W. India are pudding raisins, large ordinary grapes, dried carefully in the sun and sold at 3 seers per rupee. The Dagh, are bloom raisins prepared by dipping the finest bunches into a hot solution of lime and potash, and then drying in the shade.—*Waterston, Powell, p. 270. Poole Statistics of Commerce. O'Shaughnessy. Beng. Phar. p. 222.*

RAISINS DE CORINTHE. FR. Currants.

RAITUM. A small river near Neemuch.

RAJAGRIHA. A town of Behar, near which are celebrated buddhist caves. The milk maid's

cave and brahmin girls' cave have inscriptions in the Lat character. The caves are above B. C. 200, and are the most ancient in India. The Nagarjuni cave and Haft Khaneh or Satghar group, are in the southern arm of the hill at some little distance from the Brahman girls and milkmaids' caves. Another neighbouring group is the Karma Chapara and Lomas Rishi caves. Twenty years after the death of Sakya, Ajata Satra re-collected the fragments of his remains and erected over them a great Stupa or tope at this place. See Ajata Satra; Behar; Budd'ha; Karli; Tope.

RAJAH DAKHINA RANJAN MOOKERJEE, one of the pioneers of female education in Bengal. "The first Hindu Female School in India, for giving a liberal education after the European model, called the Victoria School, was established in Calcutta, in April 1848, by the late Honorable J. E. D. Bethune" in rajah Mookerjee's house in Sukea's Street. Within a few weeks from the day of its commencement, there were enrolled among its pupils 70 daughters of the most respectable families in Calcutta, and among them was a cousin of his own. (a grand-daughter of the late Baboo Dwarka Nath Tagore) a daughter of the late Honorable Shumboo Nath Pundit, a grand-daughter of Raja Kali Krishna Bahadoor, and other notabilities of Calcutta. The school was subsequently removed to Cornwallis Square, Calcutta.

RAJAH-RAM, Bag'hel, protected the wife of Hamayun, the emperor Akbar's mother.

RAJAH'S CHOULT'RY, immediately west of Madras, has extensive beds of clay-slate in which the brothers Schlagentweit discovered tertiary fossils. Underlying the sands and clays of Madras and all along the sea coast, is a bed of dark blue tenacious clay, containing numerous fossils of existing species.

RAJA MUCUTA. See Sacti.

RAJA MAHA KSIATRAPA. See Inscriptions; Junagurh.

RAJAMUNDRY, in L. 17° 10' 5"; L. 81° 46' 6", a large station, west of Coringa. The Dak bungalow is 81 feet above the level

of the sea Godavari 30 feet. The district of the Madras Presidency, with the chief towns of Rajahmundry, Samulcottah and Coringa, was formerly a Madras Collectorate between Vizagapatam and Masulipatam, with a district population of 1,012,000. It lies between the eastern hills and the sea, and the Godavery enters it through a gap in the chain, and passes through the district to the sea. At the village of Dowlaishwaram, in the Delta of the Godavery is a large anicut, 7 miles long. Chicacole and Rajahmundry were the capitals of Andhra, and of a race of sovereigns anterior to the Christian era.

RAJANG or **REJANG**. See India.

RAJA PRASANGA. See Inscriptions.

RAJAPUR. Lat. 18° 16' N. long. 73° 0'.

RAJA PUTNI MULL of Benares, built a bridge over the Garamuassa, the waters of which are deemed by hindoos injurious to their soul's safety. The same re-built a temple at Muttra which cost 70,000 Rupees, made a stone tank here at a cost of three lacs, a well at Jwala-Mukhi, which cost 90,000 Rupees, he spent 90,000 on a ghant at Hurdwar, 60,000 Rupees on a Serai at Brindabun, on these and other public works he spent eight lacs of Rupees for which Lord W. Bentinck made him a rajah. He has recorded in four languages on this bridge, the fact of his erecting it: the foundation had been previously laid by the prime minister of Poona who spent three lacs on it. The bridge was designed by James Prinsep.—*Calcutta Review*, No. XLI. *Tr. of Hind.* Vol. I. p. 235.

RAJA-POOTA. SANS., from rajan, a king, and putra, a son.

RAJA RAJ. SANS. King of kings.

RAJA RAJESHWARI. SANS., from rajaraj, king of kings, and ishwari, a goddess.

RAJARSHI. SANS., from rajan, a king and rishi, a sage.

RAJA RAM-MOHUN RAI. A hindu reformer of the early part of the nineteenth century. See Ram Mohun Roy.

RAJA RAJASA MAHATASA AYASA. See Kabul.

RAJA SAMANTA DATTA. See Inscriptions.

RAJASAYA, amongst ancient hindu sovereigns, a sacrifice performed to indicate that the sovereign is supreme over other kings: is an emperor: a royal sacrifice performed at an assertion of sovereign supremacy, at a national banquet, combined with a religious significance as a sacrifice to the gods.

RAJSHAY. A district in Bengal, its station town Rampur. It is bounded on the N. E. by grals.

RAJA SUYA, SANS., from rajan, a king and su, birth.

RAJASTHAN or Rajpootana, is the collective and classical denomination of that portion of India which is 'the abode of races who designate themselves Rajpoot or princes.' In the familiar dialect of these countries it is termed Rajwarra, but by the more refined Raét'hána, corrupted to Rajpootana, the common designation amongst the British to denote the Rajpoot principalities. The chief divisions of this region are—

Méwar, or Oodipoor.

Marwar, or Jodipoor.

Bikaner and Kishengurh.

Kotah, } or Harouti.
Boondi, }

Ambér or Jeypoor, with its branches, dependent and independent.

Jeselmér.

The Indian desert to the valley of the Indus.

—*Tod's Rajast'han*, Vol. I. p. 2 and 5. See Rajpootana.

RAJA SURAVIRANA. See Inscriptions.

RAJA SWAMI CHASTANA. See Inscriptions.

RAJA PRAVARA SENA. See Inscriptions.

RAJATA, ALSO RUPIA. SANS. Silver.

RAJA TARINGINI, a history of the rulers of Kashmir which commences with an account of the desiccation of the valley by Kasyapa muni, supposed to be Noah. It is in Sanscrit and is the only Indian history of any antiquity. It contains the history of the princes of Kashmir for a period of 4,000 years. A copy of it up to A. D. 1477 was presented to Akbar who ordered it to be completed. The two words are sanscrit, from rajau, a king, and taringini, a river.

RAJA UDYOTAKA KESARI DEVA. See Inscriptions.

RAJA VICHITRAVIRA. See Inscriptions.

RAJA MOHANA DUMPA. TEL. Dioscorea, *Sp.*

RAJAURI, a district in the western Himalaya lying between Kashmir on the north and Jamu on the south between Lat. 33 and 34 N. and Lat. 74 and 75 E.

RAJAWAR, a widely spread aboriginal tribe in Palamow, Singruli and Rewah, westward in parts of Sirgujah and Jushpore, and numerous to the N. E. in the parts of the plains adjoining the hills. They are the chief labouring class in the Gya district, near the hills. They live in villages as a kind of serfs and bearers of burdens, carry palanquins, and when out of employ are apt to be thieves and robbers.—*Mr. Campbell*, p. 37-8.

RAJAZ. ARAB. A battle song or war song.

RAJ-BANSI is a name used by the people of Cooch Bahar to designate themselves. They have adopted many hindu customs.

RAJ-BHAR, the Bhar of northern India, called Bharat, Raj-bhar and Bharpatwa, an aboriginal race following the meanest of avocations, especially that of swine herds. In the hills east of Mirzapur, there are some Bhar-rajaa. Tradition ascribes to them the whole country from Gorakpur to Bundelkund and many old stone forts. Prof. Wilson supposes it possible that the name comes from Bharata, an ancient name of India.—*Wilson's Glossary*.

RAJ-DWARA. SANS. Literally, 'the royal gate,' an allusion to the female apartments, or Raj-loca.

RAJEEB. BENG. Water lily, *Nelumbium speciosum*.

RAJGIR. Doubts may exist regarding the identification of Kurkihar and Giryek, but there are none respecting Rajgir, as the representative of the ancient Rajagriha. The name is still preserved in the modern Rajgir, repeated in numerous inscriptions in the temples on the Baibhar and Vipula mountains. The old city of Rajagriha is called Kusagarpura, or the city of the Kusa-grass by Hwen Thsang, who further describes it as the "town surrounded by mountains."—*B. A. S. J. No. 34, 1864*. See Rajagriha.
